Summer Sanitation Planned—A general discussion of plans for summer work, which include sanitation problems in Maryland summer resorts was held at a meeting of deputy state health officers, July 17, at the office of the state board of health, Baltimore The meeting was called by Dr John S Fulton secretary of the board The antityphoid fever campaign for the summer was one of the principal topics of discussion

Personal—Dr Henry Arthur Mitchell Elkton, who commanded the One Hundred and Thirteenth Field Hospital in France, is a patient at the university hospital where he expects to undergo an operation——Dr Charles L Mattfeldt, Catonsville health officer of the first district while on a vacation trip was taken suddenly ill at Niagara Falls and returned to his home from which he was later removed to St Agnes' Hospital

New Government Clinic Opened—A second government night clinic similar to that in operation at Mercy Hospital has been opened at the university hospital It is open to men Tuesday and Friday nights and to women Monday and Thursday nights of each week The new clinic will be directed by the same physicians that are in charge at Mercy Hospital and will follow the methods used there The daily average of patients treated for social diseases at the latter institution is above twenty-five and some days as many as 150 apply The staff of the clinic includes Dr Anton G Rytina, director Dr Wilford A H Councill, Dr Harry M Robinson and Dr R Gerard Willse

Health Lessons Given to Children—The children's playground association has broadened its activities this summer with the institution of health demonstrations The demonstrations will be held at one of the playgrounds each day throughout the summer and will teach the fundamentals of health and care of the body The Maryland Tuberculosis Association is cooperating and has announced that a silver cup will be awarded to the playground making the highest number of health points" Dr Caroline B Towles, Baltimore will direct the educational classes for mothers which will be held at the various recreational centers in the evenings

MICHIGAN

State Takes Over Tuberculosis Clinics.—Arrangements have been completed by the Michigan Tuberculosis Association whereby the Michigan State Department of Health will take over the free tuberculosis clinic and the tuberculosis work among exservice men, hitherto conducted by the association

Memorial Tablet for Nurse—Friends of Julia E. Lide formerly superintendent of the Emma L Bixby Hospital, Adrian who died in France have subscribed to a fund for a memorial tablet to be placed in the hospital bearing this inscription

In memory of Julia Lide Red Cross Nurse Superintendent Emma L Bixby Hospital December 15 1913 to May 28 1917 Born April 9 1871 Died February 24 1919 Buried at St Nazaire France with and beside our soldier boys with full military honors This tablet placed by her friends

Change in Distribution of Nursing Service—The Detroit Department of Health in its *Weekly Health Review* for July 10 gives the following changes in the distribution of nursing service rendered in November and April infant welfare November, 29 and April 44 per cent school, November, 26 and April, 19 per cent, tuberculosis November 4.3 and April, 6 per cent, contagion November 26 and April 17 per cent, and other service November, 14 and April, 14 per cent There was a material increase in infant welfare work and in tuberculosis but in the work in schools and in contagious diseases there was a relative decrease

MISSOURI

Public Health Street Car—The first public health street car in the United States traveled the streets of St Louis the last week in June standing at a designated location on successive days so that the people of the communities could visit it and learn the lessons taught therein regarding tuberculosis The exhibit is being made by the Tuberculosis Society of St Louis and more than 5,000 persons visited the car during the week

Centennial Endowment Fund—The alumni and friends of St Louis University are undertaking a campaign to raise an endowment fund of $3 000 000 The centennial of the university was passed two years ago without formal recognition because of the World War The university was founded in November, 1818 as the St Louis Academy and two years later expanded into the St Louis College In 1832, the college was given a charter as a university, and the faculty of medicine was attached in 1836 The principal immediate needs of the institution are $1 500 000 to provide an income of $75 000 a year of which $60 000 is to be applied to the medical and dental schools new laboratory and other betterments for the school of medicine at the cost of $250 000 and the future needs for the college of medicine and dentistry for new clinics and new buildings $550 000 The rest of the $3 000 000 desired is for the institute of law school of commerce and finance, and the college of arts and sciences

NEW YORK

New Regulations to Prevent Anthrax—The New York City Department of Health June 16 adopted resolutions regulating the manufacture and sale of hair brushes and hair cloth These resolutions forbid the use in the manufacture of hair brushes and hair cloth of any animal hair which has not been sterilized by a process prescribed or approved by the department of health No person is permitted to bring into or offer for sale or sell or deliver in the city of New York any cloth or brush containing animal hair unless it shall have been so sterilized These regulations provide that proper sterilization shall consist in boiling the hair in water maintained at a temperature of 212 F for three hours or the placing of the hair in an autoclave in which a 10 inch vacuum is produced and live steam then turned on and kept at 15 pounds pressure for a period of three hours

New York City

Personal—Dr S Josephine Baker has been made consultant in child hygiene for the U S Public Health Service and has received a commission as surgeon in the reserve of the U S Public Health Service——Dr Jacob Sobel has been designated assistant director of the Bureau of Child Hygiene of the Department of Health——Miss Julia Stimson has been appointed superintendent of the Army Nurse Corps with the relative rank of major

Police Hospital for Brooklyn.—The committee appointed to consider the need for a police hospital has decided that the city should have such an institution The purpose of such a hospital will be to provide medical surgical and clinical treatment for the police force active or retired and

for their families A campaign for $5,000,000 will be started shortly It is estimated that the site will cost $800,000, the building and equipment, $2,500,000, and the rest will form an endowment to meet in part the cost of up-keep

Wood Alcohol Deaths—The report of the Metropolitan Life Insurance Company for the first four months of 1920 shows that there were forty deaths from wood alcohol poisoning incidental to the use of adulterated beverages During the same time there were eighteen deaths from acute or chronic ethyl alcoholism Under present conditions wood alcohol poisoning is, according to this report, a significant cause of death On the other hand, deaths from alcoholism in the narrow sense of the term numbered twelve during this period as against sixty-two for the same period of 1919 Alcoholic cirrhosis of the liver shows no deaths thus far this year, although there were seven during the first quarter of 1919

Taking Fingerprints of All Babies Advocated—Owing to the difficulties encountered in an investigation into the circumstances under which an undertaker obtained a woman's body from the morgue and buried it without the knowledge of her relatives, the suggestion made by Deputy Police Commissioner Joseph A Faurot and Acting Capt John A Ayres, that physicians filing birth certificates be required also to file fingerprints of the new-born baby is receiving open discussion by city officials It is pointed out that this would make available an infallible lifelong method of identification, would prevent the burial of a body as that of another person, would limit opportunity for fraud and guard the individual Dr Frank J Monaghan, Brooklyn, acting health commissioner, has expressed himself as favorably impressed with the plan, as it would give an identification record that would stand a legal test and would serve to identify lost children It is thought that to have the system favorably considered it will be necessary to educate the public because the mention of taking fingerprints suggests a criminal process, though it may be quite as useful in safeguarding the individual or in saving a fortune

NORTH CAROLINA

Report Profits for Children's Hospital—Out of the profits of Grove Park Inn Asheville, the owner will construct and maintain in Asheville a modern hospital for the treatment of crippled children of America on a site near Grove Park Inn on Sunset Mountain Dr W P Herbert, Asheville, will be chief of the medical staff

Colored Medical Association Meeting—The thirty-first annual meeting of the North Carolina Medical, Dental and Pharmaceutical Association was held at Rocky Mount, June 29 and 30, and Charlotte was selected as the place of meeting for next year, and the following officers were elected president Dr William C Strudwick Durham, vice presidents, W H Williams, Goldsboro, and Peter W J Burnett Rocky Mount, and secretary-treasurer, Dr Clyde H Donnell, Durham

Physician Fined for Failing to Report Births—The highest fine as yet imposed in a local court for violation of the state vital statistics law was imposed on Dr B W Tugman Warrensville, July 17 He is said to have been assessed $50 and costs in two cases of failing to report births when he was the attending physician The case was aggravated by the fact that last summer Dr Tugman was convicted and given a nominal fine and that in this instance prosecution was instigated only after repeated unsuccessful efforts had been made to get him to comply with the law

OHIO

Society Acquires Building—The Toledo Academy of Medicine has purchased the Frank H Hurd Democratic Club Building, Toledo for $42 500

Gift to Homeopathic College—It is reported that a gift of $400 000 has been made by Mr Charles F Kettering of Dayton to promote research in the College of Homeopathic Medicine of the Ohio State University

Medical Chautauqua—A medical chautauqua for physicians of Dayton and vicinity will be held at the Fidelity Building, Dayton, September 21 to 24 Among the physicians on the program are Drs Hugh T Patrick Dean Lewis and Alfred C Croftan, Chicago, Dr Walter B Cannon of Harvard University and Dr Lillie of the Mayo Clinic

Reciprocal Relations Withdrawn—At a recent meeting, the Ohio State Medical Board adopted a resolution canceling reciprocal relations with the Arkansas Eclectic Board of Medical Examiners The reason stated was that the latter board persisted in examining and licensing graduates of a nondescript medical college of Kansas City which is not recognized as an eclectic college by the National Eclectic Medical Association

Personal—Dr Stephen A Douglass, superintendent and medical director of Ohio Tuberculosis Sanatorium, Mount Vernon, has resigned to take effect September 1——Dr Thomas J Arundel, Youngstown who served in Italy during the war as dietitian and physician with the Knights of Columbus, has received from the Vatican the gold cross "Pro Ecclesia et Pontifice' in consideration of service rendered humanity and the church——Dr Harry L Rockwood has been appointed health commissioner of Cleveland

Public Health Meeting—The American Public Health Association will meet in San Francisco September 13 to 17 Special cars will leave from Boston and New York on September 7, connecting with a special train leaving Chicago, September 8 The program will include the following entries a symposium on the relative functions of official and non-official health organizations, western health problems, narcotic control, food poisoning, organization for child hygiene, mental hygiene and health centers The foregoing subjects and others will be distributed among the following ten sectional groups General Sessions Public Health Administration Laboratory, Vital Statistics, Sociological, Sanitary Engineering, Industrial Hygiene, Food and Drugs, Personal Hygiene, and Child Hygiene

Bequests and Donations—The following bequests and donations have recently been announced

Boston Floating Hospital Sharon Mass Sanatorium and Quincy (Mass) City Hospital each $2 000 by the will of Daniel F Chase Quincy

Methodist Hospital Philadelphia $5 000, by the will of Charles W Harding

Nyack (N Y) Hospital $1 000 by the will of Justice Ernest Hall

Locust Mountain Hospital Shenandoah Pa donations of $2 500 by four physicians of Shenandoah and one of Pottsville Pa

The Zionist organization a donation of $18 500 for the development of medical and health service in Palestine by Mrs Nathan Strauss and $100 000 for a health and research department of the Hebrew University of Jerusalem a donation by Mr Nathan Strauss New York

For the Children s Hospital project of the Mystic Shrine a donation of $7 000 by Retiring Past Potentate William Freeland Kendrick Philadelphia

Bridgeport (Conn) Hospital $10 000 by the will of William F Armstrong

Rockefeller Institute Appointments—The board of scientific directors of the Rockefeller Institute for Medical Research announces that Dr Winthrop J V Osterhout Cambridge, Mass, has been appointed a member of the board, succeeding Dr Theodore C Janeway, deceased——The following associate members have been made members Dr Alfred E Cohn, medicine, Dr Francis Peyton Rous, pathology and bacteriology, Dr Donald D Van Slyke, chemistry The following associates have been made associate members Dr Francis G Blake medicine, and John H Northrup experimental biology——The following assistants have been made associates Dr James H Austin medicine, Harry W Graybill, animal pathology, Dr William C Stadie, medicine——The following have been made assistants Miss Helen L Fales, chemistry, Dr Philip D McMaster, pathology and bacteriology, and Miss Marion L Orcutt, animal pathology——The following new appointments were announced Harry Clark, associate member in pathology and bacteriology, Pierre L du Nouy associate member in experimental surgery, Dr Paul H de Kruif and Lloyd D Felton, associates in pathology and bacteriology, Dr Rudolph W Glasser, associate in animal pathology, Drs Carl A L Binger, Ralph H Boots and Charles P Miller, Jr, assistants in medicine, Dr Louis A Mikeska, assistant in chemistry, Eugene V Powell, assistant in roentgen ray, Dr Leslie T Webster, assistant in pathology and bacteriology, Drs Goronwy O Broun and Andre L E Gratia Miss Katherine M Dougherty and Mr Thomas J LeBlanc fellows in pathology and bacteriology, Dr Giovanni Martinaglia fellow in animal pathology, Mr Henry S Simms, fellow in chemistry——Dr Marshall A Barber associate in pathology and bacteriology has accepted a position with the U S Public Health Service to do field work in the malaria research laboratory Memphis, Tenn——Miss Angelia M Courtney, assistant in chemistry has accepted an appointment to do chemical research work in the University of Toronto——Dr Carl Ten Broeck, assistant in the department of animal pathology, has been made associate professor of bacteriology in Peking Union Medical College——Mr Earl B Clark, assistant in chemistry, has accepted a position with the bureau of standards——Dr Ferdinand H Haessler, assistant in pathology and bacteriology, has been appointed resident pathologist to the department for nervous and mental diseases of the Pennsylvania Hospital, Philadelphia——Dr Arthur B Lyon, assistant in medicine, has resigned to enter private practice

Colonel Russell Resigns to Take Up New Duties—Col F F Russell has resigned from the Medical Corps, U S Army, to take charge of the newly organized Division of Public Health Laboratories of the International Health Board of the Rockefeller Foundation Colonel Russell's resignation from the army is to be regretted so far as the medical corps is concerned He has been recognized as one of its most efficient officers, he has the rare combination of scientific spirit and executive ability and through this combination has accomplished much He has developed and stimulated the scientific spirit in others so that the accomplishment of the army in scientific matters has been by no means inconsiderable In 1908 Colonel Russell introduced prophylactic vaccination against typhoid fever in the army The well-known Russell double-sugar medium was a product of this period and was the first instance in which more than one indicator of the bacterial action was used in the same tube In 1903, he collaborated with Hiss in the study of dysentery bacilli and described the organism later known as the Hiss-Russell or "Y," type of the dysentery bacillus On the death of Major Carroll in 1907, Colonel Russell was placed in charge of the laboratories of the Army Medical School, with which he has been more or less associated ever since In 1912 Colonel Russell went to Porto Rico to assist in suppressing an outbreak of plague In 1914 he went to Vera Cruz as a member of the expeditionary force and directed the laboratory service of the medical department In 1915-1917 he served on the Canal Zone and planned and built the model board of health laboratory In administrative lines he has been especially active in building up the Army Medical School and department laboratories from the point of view of equipment personnel and output For some years he has advocated the placing of the school on the grounds of the Walter Reed Hospital, and the development of a symmetrical scheme for graduate medical education, combining both hospital and laboratory facilities This project is about to be realized, largely through the active support of Surgeon-General Ireland While there is universal regret in the medical corps over the loss of Colonel Russell's services to the army, it is realized that his ability and his army experience will be especially valuable in his new position He will retain a commission in the reserve corps

FOREIGN

Cholera in Japan—A press telegram from Tokyo states that 500 new cases of cholera had been reported in Japan in the previous week

Prize Awarded to Inventor of Cinematic Amputations—The Ribero prize of 20 000 lire was awarded recently by the Turin Accademia di medicina to Dr G Vanghetti of Empoli, Italy for his method of cineplastics, the utilization of the muscles in the amputation stump to actuate artificial limbs

Testimonial to Roux of Halle—Dr W Roux, professor of anatomy at the University of Halle known for his research on the mechanics of evolution and functional adaptation of parts, recently reached his seventieth birthday, and a prize was founded in his honor by the city of Halle and another by the minister of arts and sciences His pupils also collected 31 000 marks toward a special institution for research on evolution, and two *festschrifts* were presented to him

Deaths in Other Countries

Dr M Anzoátegui, a leading physician of Salta province, Argentine, at one time minister of the treasury, aged 50—— After a long illness Dr Terroba y Solares, ophthalmologist of Mexico City——Dr David Berry Hart, lecturer and writer on obstetrics and gynecology at the School of Medicine of the Royal Colleges, Edinburgh, honorary member of the American Gynecologic Society aged 69——Dr P W Heiberg, one of the pioneers in modern surgery in Denmark, aged 80.——Dr B Rojas Carvallo of Santiago Chile, aged 66——Dr G Klein, professor of gynecology and obstetrics at the University of Munich and medical historian——In Cuba, Dr M Riva and Dr G J Benasach, both of Havana

Government Services

Honor to Captain Pleadwell

The order of Commander of British Empire (military division) has been conferred on Capt Frank L Pleadwell, M C, U S Navy

Departments of Public Health Service Move

Arrangements have been made whereby several bureaus of the U S Public Health Headquarters in Washington will be all located in the building formerly occupied by the U S Shipping Board at Sixth and B Streets The bureaus which will be thus transferred are the hospital venereal disease, Marine Hospital dispensary, industrial hygiene and statistical These various bureaus have heretofore been located in various parts of Washington, D C, but will in the future be located in the Shipping Board Building

Airplane Ambulance

A new design of airplane ambulance, with a fuselage designed especially for the transportation of the sick and wounded, was recently completed at the Air Service Experimental Station, McCook Field Dayton, Ohio The basis for the new ambulance is the DH-4 type of airplane, but many modifications have been made to increase its stability and safety The depth of the fuselage behind the pilot's seat has been increased, and this space has been divided into upper and lower compartments, each of which provides space for one litter patient Above the upper compartment is a cockpit provided with a portable seat for the use of the medical officer On its trial flight, the ambulance negotiated 130 miles in sixty-five minutes and made the return trip in 105 minutes Several ambulances of the new type are being constructed for use on the Mexican border

Medical and Surgical History of the World War

Among the important work under way in the office of the Surgeon-General of the Army is the preparation of the medical-surgical history of the World War Col Charles Lynch, M C, is in charge of this work and is assisted by Colonels Brook Siler, Moncrief, Wolf, Oliver and Major Kramer of the Surgeon-General's staff

The history will include an account of the work done during the war in a great many branches of modern scientific medicine and surgery Subjects to be presented and medical officers who will present such subjects are set out in the following

Administration Western Front Lieut Col Louis C Duncan
Administration United States Lieut Col Fielding H Garrison
Narratives Col Bailey K Ashford
Sanitation Col W P Chamberlain
Sanitation Western Front Col Haven Emerson
Internal Medicine Gen W S Thayer
Surgery Gen John M T Finney
Neurology Col Thomas W Salmon
Oto Rhinology Lieut Col Joseph R McKimon
Statistics Maj Albert G Love
Pathology Col William H Welch
Hospitals Lieut Col Casey A Wood
Communicable Diseases Col Hans Zinsser
Gunshot Wounds Col George E Brewer
Aviation Col Thomas R Boggs
Gas Defense Col H L Gilchrist
Reconstruction Col Frank Billings
Ophthalmology Col George E deSchweinitz

It is expected that the history will contain about fifteen volumes, and according to present tentative plans the respective volumes will cover the following titles

I Introduction
II Administration—United States
III Administration—Western Front
IV Statistics Mathematician Interpretation of Data (Anthropometry)
V Sanitation in the United States Including Possessions
VI Camps and Cantonments
VII Hospitals
VIII General Medicine
IX Neurology
X Surgery
XI Gunshot Wounds
XII Pathology
XIII Physical Reconstruction
XIV Air Service
XV Chemical Warfare

Foreign Letters

PARIS

(From Our Regular Correspondent)

July 1, 1920

Death of Simonin

Dr Simonin, director of the army medical school at Lyons recently died at the age of 56 In the early part of the World War Dr Simonin was severely wounded and taken prisoner and he wrote an affecting account of his experiences during this captivity

Congress of Alienists and Neurologists

The twenty-fourth Congres des medecins alienistes et neurologistes de France et de pays de langue française will be held at Strasbourg, August 2-6 1920 Dr E Dupre clinical professor of mental disorders and diseases of the brain on the Paris medical faculty and Dr Pfersdorff professor of psychiatry on the Strasbourg faculty are president and vice president respectively of the congress The topics listed for formal discussion include postoneiric psychoses opened by Dr Delmas, occupational factors in mental disorders opened by Dr Coujonlou, and the lesions of the thyroid gland in exophthalmic goiter, opened by Dr Roussy

The Work of L'Œuvre Grancher

In a communication to the Academie des sciences morales et politiques Dr Armand-Delille recently stressed the value of familial placement of children in child welfare work Basing his arguments on the results obtained by L Œuvre Grancher, which has placed more than 2000 children, Dr Armand-Delille insisted on the superiority of this method first and foremost from the moral point of view because it most nearly approaches the conditions of normal family life from the hygienic point of view because it avoids the danger of infectious diseases the complications of which are particularly fatal to institutional children especially in nurseries and baby homes from the economic point of view because it does not require large sums for buildings and the salaries of a specially trained personnel always difficult to find, from the social point of view because the child thus takes a liking to a trade or if a girl to housekeeping

Finally, familial placement offers the advantage that if the family has been chosen with the desirable discernment the child finds an educational and moral environment superior to that in the average run of family The only necessary condition therefore to demonstrate the incontestable superiority of familial placement is that the choice of the family be made carefully under competent supervision

The Truth About American Prohibition

Under the foregoing title the *Ligue Blanc* official organ of the Ligue nationale contre l'alcoolisme published an interesting and expedient article As a matter of fact for some time past the daily press has carried foreign dispatches tending to prove that prohibition in the United States has had no social effect except to encourage the use of more deleterious drugs morphin cocain ether and methyl alcohol the latter agent is said to have caused poisoning en masse It is also claimed that prohibition has caused in reality an increase of alcohol consumption and of crime that it has provoked popular uprisings and brought on a strike of workmen would be malcontents because they were no longer able to drink freely It is said that a great number of American workmen recent immigrants have returned to their native countries where they can drink again at will One reads that on the roads leading to Cuba where alcoholic beverages may be freely obtained are encumbered with motor vehicles [illegible]

a short course of inebriety, that 2 miles off the coast a floating island has been built where thirsty Americans can become inebriated in all privacy There is not space enough to relate all the tiresome stories which are printed, without even a wrinkling of the forehead, by the public press under subsidy of an international syndicate of liquor merchants Attentive reading suffices to convince one that such news is made of whole cloth One thing is certain, that this European newspaper campaign has enormous financial support, but unified direction, the semblance of sincerity and tact are lacking These lies are devoid of even the most elementary scientific logic, which alone could bring illusion to the uninformed readers

The *Etoile Bleue* thinks that it is incumbent on independent journals to publish the truth about prohibition supported by the best possible proof It quotes from reputable and reliable papers to show certain good effects of prohibition, among others the decrease in arrests for drunkenness, the diminution of poverty and the increase in savings and bank deposits This article is all the more interesting since the antiprohibition campaign recently found an echo in a medical journal The *Gazette des hopitaux*, in fact, published a letter from an American correspondent who claims that prohibition was forced on the country, as it were by surprise, by certain radical elements which very cleverly knew how to profit by the favorable circumstances created by economic exigencies of the war and by the absence of a large number of voters

Visit of Spanish Physicians

A group of Spanish physicians, including Dr Nuñez Grimaldos, editor of *Los Progresos de la Clínica* and *Plus Ultra*, recently visited the Paris medical faculty and the Pasteur Institute

Annual Meeting of the British Medical Association

The eighty-eighth annual meeting of the British Medical Association, held at Cambridge, was the first complete meeting held since the war during which the scientific part of the annual meeting was suspended At the meeting last year in London this was resumed, but the meeting was not a complete one, as the number of sections was greatly reduced Before the war the next annual meeting had been arranged to take place at Cambridge Hence the present function can be regarded as a postponed one and its importance was increased by this fact The ample accommodation provided by the university, the beauty of the surroundings, and the historical interest of this famous seat of English learning made an ideal setting Among the distinguished foreign visitors present were J Bordet, president of the Faculty of Medicine and director of the Institut Pasteur, Brussels, Piero Giacosa, professor of materia medica and experimental pharmacology, Turin, Dr Simon Flexner, director of the laboratories of the Rockefeller Institute, New York, Dr John J Abel, professor of pharmacology, Johns Hopkins University, Baltimore, Dr R R Browne, representative of League of Red Cross Societies, Geneva, Dr Harold Feil, New York, Dr Robert W Hegner, director of the department of medical zoology, Johns Hopkins University, and Dr Alfred Hess, professor of clinical pediatrics, Bellevue Medical School, New York

THE PRESIDENT'S ADDRESS

The president, Sir T Clifford Allbutt, in his address, entitled "The Universities in Medical Research and Practice," asserted that the universities, ancient and modern, from Alexandria to Edinburgh, have made the professions He sometimes thought that the "classics" would have to come back as a "modern side' The university stood for each student for something larger than the field of a particular calling, for a more comprehensive design We must be trained not only to handle particulars but also to handle ideas Narrow specialization was found in medicine, as in other arts, among people of narrow culture, never among the Greeks, but abundantly among the Egyptians, the Romans, the third century folk, and today in the tribes of Melanesia Specializing was prone to be quackish, and had been said to be "only an unequal distribution of ignorance" He pleaded for a study of comparative pathology Light for the study of the generation of diseases in man must be obtained in part by a study of diseases in animals and plants Discussing the future of the physician, under the projected socialization of the profession, he considered that an official physician would be as alert and progressive as a country parson whose service is not much kindled by the chances of promotion, while to shift an official physician from place to place would be to cut the inner threads of those intimacies which we now declare to be clues to the detection of diseases at their sources Yet, as things are, the independent practitioner is isolated, even in a town he is likely to make a little orbit for himself, he lacks mental incentive, and gradually lets slip occasions of scientific reunion

At the conclusion of his address the president was presented with his portrait, the work of Sir William Orpen, which had been subscribed for by a great number of physicians Sir Norman Moore president of the Royal College of Physicians, who made the presentation, said that Sir Clifford Allbutt deserved to rank with his great predecessors in the chair of medicine at Cambridge, who included Glisson, the celebrated anatomist

THE MEDICAL CURRICULUM

In the Section on Medical Education the introductory address on The Place of Preliminary Science in the Medical Curriculum" was delivered by Sir George Newman principal medical officer of the ministry of health He considered that four reforms were needed in the medical curriculum 1 A lightening of the curriculum at both ends In other words, fuller preparation in science before entering the medical school, and a postponement of certain specialties to the postgraduate period 2 A fuller study of the sciences preliminary to medicine and a closer application of these sciences to clinical work Above all there was great need of biology (anatomy and physiology) 3 Development of clinical teaching of university standard, particularly in relation to the beginning of disease, the closer integration of various forms of clinical practice and of clinical with intermediate study, concentration on the protean diseases of tuberculosis malaria, venereal and malignant diseases, and an understanding of the social side of therapeutics as well as the social side of aspects of disease 4 Further state aid though with a minimum of state control More teachers, better teachers and better-paid teachers were necessary

In a paper on the teaching of anatomy, Prof Arthur Keith made a novel and startling plea Every medical teacher should keep his knowledge in such a state that, if called on, he could resume or assume the role of a general practitioner This was the only guide by which the teacher had as to what his pupils should know He believed that he had himself gained in every way by keeping up his knowledge of general medicine If there was compulsory training of the physician, why not of the medical teacher? At every great medical school every teacher of anatomy and physiology should hold occasional clinical appointments up to their thirty-fifth year Another reform needed was in the scope of textbooks which strove to serve as works of reference for the research as well as the pass student The greatest sinners were the anatomists

and physiologists, their books could be reduced by half with an improvement in the education of the man who is to practice general medicine ' He requires for diagnosis a knowledge of the exact situation and action of the parts of the body But less than half of our textbooks were devoted to this It was not so with the earlier textbooks, which were keys to the living body Examination papers were a wearisome repetition of "describe" this and "describe' that, as if the student could apply pure description or obtain any assistance from it in practice Anatomy could be made a living part of medicine if only the teacher would ask himself Could this fact help me in diagnosis or treatment? If not let it repose in the comfortable storage of works of reference until it has proved its right to enter the currency of applicable knowledge

THE REPRESENTATIVE MEETING

At the meeting of the representative body, many subjects of great importance were discussed It was decided to increase the annual subscription from the present one of $10 50 to $15 75 The reason for the increase was not only the great increase in the cost of producing the *Journal* in all directions, but also the need for adequate funds to carry on the forward political policy of the association The meeting resolved to ask the council to consider the desirability of excepting from the increase any member who had retired from practice or was of forty years standing, as many of these received no benefit from the political work of the association, and continued their membership out of loyalty to it

PROFESSIONAL SECRECY

A long debate took place on the question of professional secrecy which, as pointed out in previous letters to THE JOURNAL, is on an unsatisfactory footing in this country In 1915 the council of the association went fully into the question and was advised that apart from state officials, such as ministers of the crown, judges of the high court, and others placed in positions of more or less supreme importance, the only classes of persons recognized by the law courts as competent to claim to hold statements made to them involving matters of criminal import or otherwise, as absolutely inviolable from obligation to disclose were lawyers and ministers of religion But though no such universally recognized protection attached to statements made to a member of the medical profession by a patient, there was admittedly a certain degree of professional secrecy recognized as being associated with such statements although a conflict of authority existed as to the extent to which this could be carried As a result of its consideration of the subject, the council expressed the opinion that 'a medical man should not under any circumstances disclose, voluntarily, without the patient's consent information which he has obtained from that patient in the exercise of his professional duties" The chairman of the Central Ethical Committee moved a resolution identical with the preceding excepting that the words "more particularly with regard to venereal disease' were added The provision by the state of centers for the treatment of this disease has raised in a new form the question of professional secrecy The chairman recognized that there must be exceptions to the rule A physician might receive an order from a court to divulge In such a case an individual physician might feel that he should defy the order and take the consequences A physician might feel it his duty to divulge a professional secret in order to prevent the committal of a crime or injury to a third person In the discussion a member told a story which illustrates the unsatisfactory state of the law on the subject On the grounds of professional confidence he refused to answer a question in a court Some time afterward he was attending the judge who said to him 'You know I could have imprisoned you last week for not answering that question, but if you had I never would have had you in my house as a physician again' The motion was carried.

SECRET REMEDIES

A resolution was carried that a physician should not make use of or recommend any remedy the principal ingredients of which were not disclosed to the profession The chairman of the Central Ethical Committee said that it had been brought home to the committee that there was growing laxity in this matter on the part of a large number of members of the profession They had taken a very strong public line in urging Parliament to bring in legislation to control the sale of registered preparation with the perpetual protection of trade marks and other similar practices which they regarded as inimical to the public interest But if they found that the advertisers were able to say truthfully that physicians themselves were guilty of gross remissness in regard to that question, they had the ground cut from under their feet for any effective action

Tabes and Eye Disorders

Professor Fuchs recently delivered at the Real Academia Nacional de Medicina of Madrid an excellent lecture on "The Relations Between the Eye and Tabes" This disease is preceded by premonitory symptoms, which Fuchs divides into (1) *pupillary signs* (2) *paralysis of the motor oculi*, and (3) atrophy of the optic nerve

PUPILLARY SIGNS

1 Absence of the light reflex (Argyll Robertson sign) It is well known that the normal pupil reacts by contraction to the light as well as to convergence and accommodation The first contraction is reflex while the contraction during convergence and accommodation is a synergic or associate action, for the nuclei of the abducens nerves which direct the convergence (i e., rule the external recti and also the accommodation, that is the ciliary muscle and the sphincter of the iris) act at the same time, while the contraction produced by the light requires the stimulus of a centripetal nerve (optic) and one centrifugal (abducens) The combination of both forms a reflex act The dilatation of the pupil by a sensory sensorial or psychic stimulus is also reflex The centripetal branch is formed by sensory nerves and the centrifugal by sympathetic nerves which receive the stimulus of the former through the ciliospinal center of the lower cervical part of the spinal cord During the absence of the pupil reflex the pupil does not react to the light but it contracts during convergence and accommodation This lack of reflex is one of the earliest and most common signs of tabes which is found in 70 or 80 per cent of the cases as well as the absence of the patellar reflex While the location of the lesion that breaks the reflex arc is not known positively it seems most probable that it is located in the tract of the pupillary fibers of the optic nerve on their course to the nuclei of the abducens namely in the vicinity of the aqueduct of Sylvius along the posterior longitudinal bundle When there is total lack of reflex the lesion is located in the abducens itself either in the nucleus the nerve or its endings In the cases seen in the dispensary the total immobility is the terminal stage of the reflex although in other cases the former is present as such from the very beginning In tabes total immobility is three times less common than reflex immobility Reflex immobility is also found in general paresis (20 per cent) and in brain syphilis (10 per cent) while it is exceedingly rare in other nerve affections Reflex immobility is therefore an almost exclusive sign of syphilitic or parasyphilitic infection of the nervous system

2 Miosis This is the second important sign of incipient tabes, and is found in about one half or one third of the cases with reflex immobility Miosis with normal pupillary reaction is not a sign of tabes, being congenital, senile or due to chronic intoxication It is due to the inaction of the dilator through lack of stimulus Under normal conditions the stimulus of the centripetal nerves involves, through the sympathetic, a certain degree of permanent contraction of the dilator If the stimulus does not reach the nerve centers (narcosis, sleep, etc), the contraction of the dilator stops and the pupil closes In spinal miosis the cause seems to be the degeneration of the ciliospinal center, which prevents the transmission of the stimulus from the centripetal nerves to the sympathetic and then to the dilator

3 Anisocoria (pupillary inequality) This also is common in tabes, and is due to a lesion of the centrifugal abducens or sympathetic nerves It is not so important as the lack of reflex as it is less common in tabes (one fourth of the cases), and because of its being found in other conditions and even in normal cases

OCULAR SIGNS

The paralysis of the motor nerve (in 20 per cent of tabes patients) appears long before the ataxia The features which characterize the paralysis of the motor oculi in tabes are its temporary character, at least in the beginning, its remissions, and the different degree of paralysis in the muscles supplied by these nerves, the transmission of stimuli to the levator palpebrae superioris, the conquering of the paralysis by an effort of the will, and the insignificant part played by the diplopia In the tabetic paralysis, the lesion may be in the region of the nuclei of the motor oculi below the aqueduct of Sylvius and the floor of the fourth ventricle We deal with degeneration processes, a proliferation of the ependyma with sclerosis of the underlying gray matter, followed by atrophy of the efferent nerves In rare cases, the lesion is found in the nerve trunk itself or the muscle endings

ATROPHY OF THE OPTIC NERVE

Atrophy of the optic nerve is the most frequent complication and ends unavoidably in blindness It is to be feared all the more, since through its occurring at the beginning of tabes, it may blind the patients for many years It is very exceptional for the atrophy to occur in the paralytic state, so that a patient with ataxia needs not fear to become blind, and in turn those with optic atrophy need not fear ataxia until much later Optic atrophy attacks from 10 to 15 per cent of all tabes patients—chiefly men in the prime of life This complication is very uncommon among women Infantile tabes, as a sequel of hereditary syphilis, is very rare, but it is accompanied almost always by atrophy of the optic nerve The atrophy does not occur at the same time in the two eyes, but very seldom is a case found in which the atrophy remains unilateral The ophthalmologic signs are far from being characteristic, the only peculiarity being that in tabetic atrophy the disk is pale at a time when the patient is not complaining as yet about his eyes The descending atrophy is accompanied by other symptoms The pallor of the disk shows that the degeneration occurs in the anterior ending of the optic nerve in the peripheral bundles The first symptom of the loss of vision is the retarded adaptation to darkness, afterward the acuteness and the visual field diminish for the perception of some colors, as red and green, while the perception of form remains Whatever may be the relation between the central visual acuteness and the visual field, the disease always ends in complete blindness in a period that varies from a couple of months to twenty or more years Tabes patients are syphilitic cases whose infection seems mild Those having frequent syphilitic manifestations are not threatened by tabes, and that is the reason why this condition is never seen in those who have suffered syphilitic uritis or perforated palate The oculist is frequently the first one to diagnose tabes When this is detected in its incipient stage, there should be made a general examination of the patient and a blood and cerebrospinal fluid Wassermann test, determining, also, in the cerebrospinal fluid the globulins, lymphocytosis and the albumins by the colloidal gold test If the blood and cerebrospinal fluid tests are positive, there is danger of tabes or general paresis, and there must be instituted a vigorous treatment until the tests become negative When these diseases have become apparent, the treatment is usually rather inefficacious, and although other symptoms may improve, the action on the optic nerve is practically nil The failure of the specific treatment in parasyphilis is explained by the special conditions of the blood supply of the nervous system The meninges are rich in vessels which are in contact with the surrounding connective tissue, and therefore the blood and the medicinal substances contained in it can pass freely from the vessels to the meningeal tissue In the nervous tissue, on the contrary, the vessels are surrounded by a sheath of neuroglia that seems to offer an insurmountable barrier to some substances Syphilitic affections locate by choice in the meninges, while with parasyphilis the spirochetes are found in the nervous tissue itself and therefore are not accessible to drugs This is the reason why the introduction of remedies directly into the cerebrospinal fluid has been suggested The success with other symptoms of tabes lends hope that this method may prove effective in the atrophy of the optic nerve

(From Our Regular Correspondent)

June 28 1920

Aftermath of the World War

The tremendous political, social and economic disasters which were brought on the German people by the war, by the treaty of peace and the revolution have had special influence on the medical profession, the public health service and medical science

OVERCROWDING OF THE MEDICAL PROFESSION

Many years before the war the medical profession of Germany was overcrowded, this evil has been markedly increased as a result of the war and the peace treaty The losses of German physicians on the battlefield and through other effects of the war are inconsiderable as compared to the factors which have increased the absolute or relative overcrowding of the German medical profession According to the official casualty lists, 1 325 physicians died from causes of action in the line of military duty Opposed to this decrease however, is first of all the decrease in population of the present German territory At the beginning of the war, Germany had a population of approximately 68 000 000 Dr Hugo Prinzing a leading statistician, estimates that from the beginning of the war up to Jan 1, 1919, 4,800 000 infants were born in Germany, 1,800,000 men were killed or died in military service, 5 500,000 civilians died, and about 500,000 emigrated during the same period To these losses, 3,500,000 should be added for the loss of Alsace-Lorraine, the Polish districts and the provinces of Posen, West Prussia and East Prussia, and the northern part of Schleswig Even assuming that upper Silesia and the doubtful districts of East Prussia do not revert to Poland Germany will have a population of about 61,500,000 According to figures in the German medical directory, about 1,600 physicians lived in the lost territory, of these, at least 600 were ejected or voluntarily returned to Germany from the new French and Polish possessions Whereas, before the war there were 34 000 physicians in Germany with a population of 68,000 000, there are today 32,000 to 61,500,000 inhabitants, evidently a considerable

increase in the ratio of physicians to inhabitants, to the disadvantage of the former This factor, already of deplorable consequence to the economic status of physicians, will in the future prove almost catastrophic because of the inordinate increase during the last year in the number of medical students, whose ranks will be further augmented in succeeding years During the war, it was imperative to increase the number of trained medical assistants because of military necessity, and the entrance examinations were made much easier What an enormous student body was thereby constituted during the fifth year of the war is now startlingly apparent in the lecture rooms of the medical schools There has been further accession from the ranks of other vocations, as a result of the political upheavals that forced many to give up their former callings and to elect the study of medicine which for one reason or another struck them as the most suitable. Statistics recently compiled show that the number of medical students has increased from 11,000 in 1913 to 22,000 today Since it can hardly be assumed that any considerable portion of this multitude will fail to reach the goal, it must be expected that in a few years the number of physicians will increase to 54,000, or eight physicians per ten thousand of the population, as compared with five per ten thousand in 1913 Although this unfavorable disproportion in itself represents a restricted earning capacity, it can readily be understood that the poverty of the German people will have even worse influence on the economic status of physicians

SICKNESS INSURANCE SOCIETIES

By the extension of sickness insurance, even worse conditions are awaiting the krankenkassen (sickness insurance societies) physicians, who constitute the majority of the German medical profession Since the greatest enemies of insurance physicians were to be found in the ministry (especially ministers Bauer and Frässdorf), it was anticipated that the representatives of the social democratic party in the new government would very soon increase the existing disparity between krankenkassen fees and medical services Soon after the revolution of Nov 9, 1918, the provisional government extended the compulsory insurance act to include all employees with an annual income up to 5 000 marks, instead of 2 500 as heretofore If one remembers that the number of krankenkassen members rose from 5,400,000 (9 per cent of the population) in 1885, to 20,000,000 (about 30 per cent) in 1914, and that the membership was further greatly augmented by this regulation of December, 1918, he can readily understand that the private practice of physicians had shrunk considerably even then Although objections were naturally raised by the medical profession and by statesmen, the new government did not rest content with this extension of compulsory insurance but a few weeks ago it suddenly decided to include all employees with an income up to 20 000 marks, the latter figure was reduced to 15 000 marks by the national assembly as a result of a storm of protests from the medical profession and insured persons alike But even under this provision at least 90 per cent of the population was drawn into the kassen leaving a bare 10 per cent for private practice Physicians who had joined the Leipziger Verband therefore appealed to the government with the request that the prevailing scale of fees for krankenkassen physicians should be revised in conformity with the changed conditions failing which the physicians would consider their contracts with the krankenkassen as canceled and would treat the sick only as private patients under the terms of the general regulation of fees In view of the firmness and unanimity of the medical profession the government was forced into negotiations, which have not yet been concluded

So far as results are known, representatives of the medical profession virtually obtained concessions for the introduction of so-called free selection of the physician (which will admit to the kassen practice all physicians who register their intention under certain conditions) and an increase in the fees Regarding the latter factor, it may be stated that the medical representatives demanded an annual capitation allowance of 46 marks, representatives of the kassen have hitherto been willing to concede only 26 marks If one considers the services which physicians must generally render for this sum the demands will certainly not seem excessive From a general psychologic standpoint it will be understood that for this fee the members of the kassen do not always receive the services to which they believe they are entitled To realize the necessity of improvement in the status of physicians under the social insurance plan allowance should be made not only for the aforementioned increase of the insurance beneficiaries but also for the conceivable introduction of family insurance whereby the members of the employees' families will also come within the sphere of social insurance, and consequently of kassen practice

Marriages

HERMAN ANDERSON GAILY, Baltimore to Miss Mary Elizabeth McConkey of McClellan Heights York, Pa June 17

MATHEW TAYLOR MORTON Estherville Iowa, to Mrs Townsend of Monroe Iowa, at Spirit Lake, Iowa, recently

ROBERT LOUIS LEVY to Miss Beatrice Strauss, both of New York City, at Mount Kisco, N Y, June 29

LEE HERMAN KIEL Sioux Center Iowa, to Miss Jennie DeLong of Orange City Iowa, recently

WILLIAM VESTAL THORNBURG Yale Iowa, to Miss Adele Fonaldi of Des Moines, Iowa, June 30

GEORGE WASHINGTON BONER, Washington, Ind, to Miss Alice Dickens of Indianapolis June 28

WALTER LEWIS ALLESPACH Buffalo to Miss Jean Halliday of Victoria B C at Toronto June 16

HARRY JAY PITTOCK to Miss Mae Vergoon, both of Ingleside Neb at Hastings Neb, May 12

ROBERT DOW FORBES Seattle to Mrs Mary R Bradley of Winnipeg Manit, at Seattle May 7

JAMES WOODROW WILSON Riverside, Iowa, to Miss Maude Armstrong of Chicago recently

WILLIAM LA ROY HORNADAY to Miss Clemantine Wolf, both of Des Moines Iowa recently

FRANK W PLEHN to Miss Elpha Peters, both of Scottsbluff, Neb in Omaha, May 3

CLARA LOUISE HORNER Camden, N J, to Rev J C Rodger of Shanghai China May 22

GREENE HAMPTON SMITH to Miss Annie Merle Farrar both of Blocton, Ala June 16

GOTTLIEB WERLEY to DR BESSIE LUCRETIA SWEET both of El Paro Texas July 3

EDWARD CARSON ABBOTT Omaha, to Mrs Alma Healey in Lincoln, Neb April 10

JAMES N DOWNS to Miss Mary B Stauffer both of Bloomington, Ill recently

BLASE COLE Newton N J to Miss Betty B Kerr of New York City April 16

ERNEST KEYES CULLEN to Miss Charlotte M Macklem both of Detroit April 28

HARRY E MCKIBBEN Hector Minn to Miss Anna Edstrom of Omaha April 10

MYRON ORMELL HENRY to Miss Lucile Fisher both of Minneapolis April 14

LEON WADE MARTIN to Miss Eleanor Marie Pickel both of Chicago July 7

SAMUEL MARMOR to Miss Ethel Perlman both of Chicago recently

BENEDICT ARON to Miss Ida Edith Cohen both of Chicago July 1

Deaths

Frederick Book Abbott, Capt, M C, U S Army ⊕ St Louis, Washington University, St Louis, 1914, aged 31, who entered the World War as a physician with the first Harvard Unit, and was on duty with the British Service and went overseas the second time with Barnes Hospital, No 21, and was gassed at Seicheprey in the Toul sector in 1918, had been ill ever since, and was under treatment at United States Army General Hospital, Oteen, N C, died in that institution June 30, from tuberculosis

Benjamin Robinson Schenck ⊕ Detroit, Johns Hopkins University, Baltimore, 1898, aged 47, associate professor of gynecology in the Detroit College of Medicine, from 1906 to 1910 secretary of the Michigan State Medical Society and editor of its journal, a member of the staff of Harper and Woman's hospitals, Detroit, died in Broadmore, Colorado Springs, Colo, June 30

Luther Zwingli Breaks ⊕ Terre Haute Ind, Rush Medical College, 1901, aged 41, captain, M R C, U S Army, and discharged May 4, 1919, a member of the American Academy of Ophthalmology and Otolaryngology, assistant ophthalmic and aural surgeon to St Anthony's Hospital, died in the operating room of that institution, July 10, from angina pectoris

Frank Ross Coffman ⊕ Denver, Gross Medical College, Denver, 1890, aged 51, once health commissioner of Denver, and vice president of the Colorado State Board of Health, local surgeon of the Denver and Rio Grande system and health officer of Minturn and Eagle County, Colo, a specialist in proctology, died in Los Angeles, April 27, from heart disease

Charles McVea ⊕ Baton Rouge, La, Tulane University, New Orleans, 1893, aged 51, president of the Louisiana State Medical Society in 1909, a member of the house of representatives for one term and for two terms state senator, Captain, M R C, U S Army, and discharged Dec 10, 1918, died, July 5, from chronic interstitial nephritis

Eugene Alexander Neely, Memphis, Tenn, Memphis, Tenn, Hospital Medical College, 1886, aged 57, formerly professor of clinical medicine in his alma mater, and president of the Southwestern Association of Railway Surgeons, for the last ten years engaged in the lumber business, was found dead in bed in Lonoke, Ark, June 30

Gustav A Mathews ⊕ Napoleon, N D (license, North Dakota State Board of Medical Examiners, 1905), aged 46, superintendent of the Logan County Board of Health, who had been operated on repeatedly for disease of the kidney, died in St Alexius Hospital, Bismarck, N D, April 14, from uremia

Robert L Gillespie, Portland, Ore, Willamette University, Salem, Ore, 1886, aged 65, professor of theory and practice of medicine in his alma mater, clinical lecturer on mental and nervous diseases in the Oregon State University, city physician of Portland for one year, died, June 30, from heart disease

Lucy J Utter, Detroit, Michigan College of Medicine, Detroit, 1882, aged 74, one of the first women to practice medicine in Detroit, once vice president and resident physician of the Woman's Hospital, and Children's Home, died in the Pennsylvania Avenue Sanatorium Detroit, July 3

William Lego Nuttall, New Castle Ky, Miami Medical College, Cincinnati, 1871, aged 75, once superintendent of the State Institute for Feeble Minded, Frankfort, Ky, was attacked by his insane brother-in-law June 28, sustaining razor wounds from which he died shortly after

Elsthon E Oglesbee, Cedarville Ohio, Hahnemann Medical College Chicago, 1885, aged 52, a member of the Ohio State Medical Association, died in Mt Carmel Hospital, Columbus, June 30 from peritonitis, a week after a nephrectomy for tuberculosis of the kidney

William L Walker, Centerville Tenn, Eclectic Medical Institute, Cincinnati 1874, aged 74, a Confederate veteran, representative in the legislature from Hickman County in 1890 died in Nashville, June 23, a few days after an operation for the removal of gallstones

James R Menzies, Weihwei, China, Trinity Medical College, Toronto, 1895, aged 56, a medical missionary in China, was shot and instantly killed by Chinese bandits, March 17, while going to the defense of the women in the Mission House, attacked by them

Frank S Johnson, Sioux City, Iowa, State University of Iowa, Iowa City, 1882, aged 64, formerly professor of neurology, histology, bacteriology and pathology in the Sioux City College of Medicine, died at his country home in Bronson, Iowa, July 6

Frank Byron Brown, Boston, Medical School of Maine, Brunswick, 1887, aged 57, a member of the Massachusetts Medical Society, instructor in bacteriology and pathology in Tufts Medical School, Boston, died, July 1, from cerebral hemorrhage

Harve Ellis Harlow, Zearing, Iowa, State University of Iowa, Iowa City, 1914, aged 39, formerly assistant state bacteriologist to the Iowa State Board of Health, a member of the Iowa State Medical Society, died in Rochester, Minn, July 7

Frank Sumner Warren, Biddeford, Me, Medical School of Maine, Brunswick, 1872, aged 69, for several years coroner of York County, a member of the board of aldermen and a member of the legislature, died suddenly, June 28

Sinclair D Gervais Niles, McGhee, Tenn, University of the City of New York, 1861, aged 80, assistant surgeon in the Confederate service during the Civil War, died at the home of his daughter, March 3, from pneumonia

Peter Henry Lane ⊕ Philadelphia, Medico-Chirurgical College of Philadelphia, 1906, aged 41, founder and for sixteen years in charge of the Kenwood Sanatorium, Chestnut Hill, Philadelphia, died, July 7, from pneumonia

John Franklin Campbell ⊕ Chicago, Victoria University, Cobourg, Ont, 1886, L R C P, L R C S, Edinburgh, 1890, aged 56, a specialist on diseases of the eye, ear, nose and throat, died, July 14, from angina pectoris

Eugene Lee Henry ⊕ Lecompte, La, Tulane University, New Orleans, 1897, aged 46, formerly president of the Louisiana State Medical Society and of the board of health of Rapides Parish, died, July 7

Fannie Donovan Conklin, Staten Island, N Y Woman's Medical College of the New York Infirmary for Women and Children, New York, 1876, aged 74, physician to the Lakeview Home, died, July 4

George L Gates ⊕ Winona, Minn, Philadelphia University of Medicine and Surgery, 1869, aged 83, a veteran of the Civil War, died at the home of his brother in St Paul, about July 3

Charles H Saul, Steelton, Pa, University of Pennsylvania, Philadelphia, 1878, aged 67, a member of the Medical Society of the State of Pennsylvania, died, June 30, from heart disease

Kimball Edward Thompson ⊕ Westpoint, Neb, John A Creighton Medical College, Omaha, 1908, aged 36, died at the home of his brother in Westpoint, July 6, from heart disease

Edward Thomas Lawler, Amarillo, Texas, Rush Medical College, 1900, aged 42, a member of the State Medical Association of Texas, died in a sanatorium in California, June 29

James Walter Anderson, Royal Oak, Mich, Michigan College of Medicine and Surgery, Detroit, 1891, aged 58, a member of the Michigan State Medical Society, died, June 21

Frederick Straughn, Jersey City, N J, University of Maryland Baltimore 1870, aged 75, from 1885 to 1890 city physician of Jersey City, died, June 27, from arteriosclerosis

Samuel John Hicks, Ivesdale, Ill, Miami Medical College, Cincinnati, 1890, aged 57, a member of the Illinois State Medical Society, died, July 4 from cerebral hemorrhage

James Maurice Hally, Denver, Bennett College of Eclectic Medicine and Surgery, Chicago, 1885, University of Colorado, Boulder and Denver, 1894, aged 76, died, May 26

Warren Perry ⊕ Fairbury, Neb, Jefferson Medical College 1891, aged 56, local surgeon for the Burlington and St Joseph and Grand Island Railroad, died, July 7

Willard Chancery Earle, Waukon, Iowa, Jefferson Medical College 1867, aged 88, also a druggist, a veteran of the Civil War, died recently at St Petersburg, Fla

Preston Boggs, Franklin W Va, University of Maryland, Baltimore, 1896, aged 52, in 1912 president of the Pendleton County Board of Health, died suddenly, June 19

Joseph Pierre Morneau, Appleton, Wis, Laval University, Quebec, 1899, aged 46, died, June 1, from lobar pneumonia

⊕ Indicates Fellow of the American Medical Association

Edwin H Lodge, Grosse Point Farms, Detroit, New York Homeopathic Medical College, New York 1871, aged 72, once president of Grace Hospital, died, July 3

William B Conway, College Park Ga , College of Physicians and Surgeons, Baltimore, 1869, aged 71, died at the home of his daughter in College Park, July 6

James A Hazle, Freeport, Kan (license Kansas Board of Medical Examiners, 1901), aged 65, a practitioner for forty years, died, April 24, from arteriosclerosis

Harry F McK Shannon, Tygh Valley, Ore , University of Oregon, Portland, 1913, aged 32, a member of the Oregon State Medical Association, died, June 28

Marion Dexter Follin, Johnsville, Ohio, Marion-Sims Medical College St Louis, 1892, aged 53, died in Lakeside Hospital, Toledo, May 23, from nephritis

Earl P Wagner ⊕ South Bend, Ind , College of Physicians and Surgeons, Chicago, 1907, aged 45, for two terms coroner of St Joseph County, died, July 1

Milton S Hopper, Gary, Ind , Medical College of Ohio, Cincinnati, 1881, aged 69, a member of the Indiana State Medical Association, died, May 10

Edward Henry Jewitt, Cleveland, Homeopathic Hospital College, Cleveland, 1878, aged 68, for twenty years a lecturer in his alma mater, died, July 7

John Steinbach, Winona, Minn , Northwestern University Medical School, Chicago 1886, aged 64, a specialist in diseases of the eye, died, April 28

Charles Albert Fritchey ⊕ Harrisburg, Pa , Gross Medical College, Denver 1901, aged 45, died in the Germantown Hospital, Philadelphia, June 24

Edward B Smith, Marion, S C , Medical College of Charleston, S C, 1860, aged 81, died at Centenary, S C, May 25, from senile asthenia

Evans Scott, Holdenville, Okla , Medical Department, University of Iowa, Keokuk, 1864, aged 85, a veteran of the Civil War, died recently

Abram W Mardis, Lebanon, Ohio National Normal University, Lebanon, Ohio 1890, aged 57, died in a hospital in Hamilton Ohio, May 2

Walter Henry Holdridge ⊕ New York, Columbia University, College of Physicians and Surgeons, New York, 1903, aged 39, died, July 3

Jefferson D Taylor, Louisville, Ky Kentucky School of Medicine, Louisville, 1882, aged 58, died, July 3, from pernicious anemia

Walter John Habrowski, Pittsburgh, University of Pittsburgh, 1911, aged 33, also a pharmacist, died, June 15, from tuberculosis

Charles B Kohlhousen, Raton, N M , University of Virginia, Charlottesville, 1867, aged 63, died, April 19, from myocarditis

Clayborn R Carver, Eldorado Texas, University of Arkansas Little Rock, 1898, aged 63, died, June 8, from angina pectoris

James O Wood, Rio Miss , University of Alabama Mobile, 1881, aged 72 died, April 4, from disease of the kidney

Nelson Porter Freeman, Bridgewater N S , University of Vermont, Burlington, 1891, aged 65, died April 15

Paul Octavius Owsley, Asheville N C , Johns Hopkins University, Baltimore, 1899, aged 46, died July 8

Peter John Nathaniel Thelberg, New York City , University of the City of New York, 1887, died, June 7

Eugene H Wood, Bridgeport, Conn , Long Island College Hospital, Brooklyn, 1886, aged 63, died June 16

James Flack Bell, Lonoke Ark (license Arkansas State Medical Board 1903), aged 65, died, May 21

Thomas H Bowles, Dumas, Ark , Missouri Medical College, St Louis, 1898, aged 65, died, May 22

Hugo Schumann, Oakland Calif , American Medical College Eclectic) St Louis 1876, died, June 30

Benjamin F Mott, Minneapolis, Eclectic Medical Institute Cincinnati 1874, aged 69 died recently

Joseph P Fitzpatrick, St Louis Missouri Medical College St Louis, 1889, aged 52 died July 4

Peter McLaren, Ormstown Que McGill University Montreal, 1872, aged 78, died May 14

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

MORE MISBRANDED DRUG PRODUCTS AND NOSTRUMS

Some Seelye Nostrums—The A B Seelye Medical Co, Abilene Kan shipped in July and September, 1917, "Seelye's Wasa-Tusa," 'Dr Seelye's Compound Extract of Sarsaparilla' "Seelye's Laxa-Tena," Seelye's Cough and La Grippe Remedy' and "Seelye's Fluorilla Compound," which were misbranded The Bureau of Chemistry of the Department of Agriculture analyzed samples of these nostrums 'Wasa-Tusa' was found to contain ammonia, chloroform, camphor, capsicum aromatics, alcohol and water It was falsely and fraudulently represented as a cure for rheumatism lame back, tonsillitis, sore throat, cholera morbus, diphtheria, fever indigestion, deafness and several other conditions when in truth and in fact, it was not' The 'Compound Extract of Sarsaparilla" was found to contain potassium iodid and a small amount of plant extractives aromatics coloring matter, sugar, alcohol and water This was falsely and fraudulently represented as a cure for scrofula, syphilis tumors female weakness and other conditions 'Laxa-Tena' was found to be a dark colored syrup containing essentially emodin-bearing (laxative) plant material sugar alcohol and water It was falsely and fraudulently represented as a cure for jaundice, sour stomach fever and ague and effective to remove the cause of appendicitis and to prevent fever The 'Cough and La Grippe Remedy" was found to be heavy sugar syrup containing plant material with small amounts of alcohol, chloroform and tar It was falsely and fraudulently represented as a cure for influenza whooping cough asthma phthisis and all affections of the throat and lungs and as a preventive, when used in connection with Wasa-Tusa," of lung fever and pneumonia "Fluorilla Compound was to be a syrup containing laxative plant material, a small amount of alkaloids, sugar, alcohol and water It was falsely and fraudulently represented as a cure for anemia 'languid habits in young girls budding into womanhood amenorrhea, leucorrhoea, falling of the womb and other so-called female weaknesses In March 1919, the company pleaded guilty and was fined $50 and costs—[*Notice of Judgment No 6953, issued July 1, 1920*]

Aspirin Tablets—The Verandah Chemical Co Brooklyn shipped in November, 1918 24 packages of a product purporting to be aspirin tablets The article was labeled in part Acetylsalicylic Acid Aspirin' These tablets were declared misbranded in that while they were labeled Aspirin 5 gr' they contained no aspirin but did contain salicylic acid corn starch milk sugar talc calcium carbonate and a small amount of sodium citrate. In June 1919 no claimant having appeared for the property, the court ordered that it should be destroyed by the United States marshal—[*Notice of Judgment No 6990 issued July 1 1920*]

Dr Groves' Anodyne for Infants—A quantity of Dr Groves' Anodyne for Infants was shipped in interstate commerce January 1917 by Smith Kline & French Co Philadelphia The preparation when analyzed by the Bureau of Chemistry was reported to be essentially a sugar syrup flavored with oil of spearmint and containing 1/8 grain of morphin sulphate to each fluidounce The government officials charged that the product was misbranded because it was falsely and fraudulently represented to be effective among other things to remove nervous irritation in children to invigorate children before teething and to relieve [illegible] caused by diarrhea and other affections [illegible] teething when in truth and in fact

further declared to be misbranded because it was falsely and misleadingly represented as "a reliable assistant to a mother in that it was a preparation which could be administered with perfect safety to infants, whereas in truth and in fact the article contained morphin sulphate, a drug which rendered the article unsafe to be administered to infants" It was further misbranded in that, while it contained alcohol and morphin, the carton failed to bear a statement of the quantity and proportion of these drugs, as required by law In May, 1919, the company pleaded guilty and was fined $200—[*Notice of Judgment No 6986, issued July 1, 1920*]

Cacapon Healing Water—In October, 1918, 6 barrels and 40 kegs of Cacapon Healing Water were shipped in interstate commerce by the Capon Springs Co of Capon Springs, W Va The water was declared by the federal authorities to be adulterated in that it consisted in part of a filthy,

A full page advertisement of Cacapon Water that appeared in the Washington (D C) *Times* in August 1918

decomposed and putrid animal and vegetable substance Furthermore, it was declared misbranded because of the curative claims made for the stuff, for example

To be 100 per cent efficient drink Cacapon Healing Water Prescribed by Prominent Physicians for Bright s Disease Kidney Troubles Cacapon Healing Water for Bright s Disease Kidney Troubles Indigestion Diabetes Calculi Rheumatism Women s Diseases Stomach Troubles Dyspepsia Uric Acid Gout Urethral and Uterine Troubles

Has cured for centuries rheumatic gout syphilitic rheumatism and chronic inflammation"

These claims were declared by the federal authorities to be false and fraudulent and "made with a knowledge of their falsity and in reckless and wanton disregard of their truth' so as to mislead and deceive purchasers In April 1919, the court ordered that the product should be destroyed by the United States marshal and that the Cacapon Co, Washington, D C, should pay the cost of the proceedings—[*Notice of Judgment No 6957, issued July 1, 1920*]

Seawright Water—In September, 1918, Seawright Magnesian Lithia Spring Co Staunton, Va shipped nine cases each containing 12 one-half gallon bottles of "Seawright Water' which was declared to be adulterated in violation of the Food and Drugs Act Adulteration was alleged in the libel for the reason that the water consisted in part of a filthy and decomposed vegetable substance No claimant appearing for the property, judgment of condemnation and forfeiture was entered in January, 1919 and the court ordered that the product should be destroyed by the United States marshal—[*Notice of Judgment No 6961, issued July 1, 1920*]

Correspondence

"THE REPORTING OF VENEREAL DISEASES BY PHYSICIANS"

To the Editor —The objection to many of the papers in THE JOURNAL is that they embody solely the swivel chair, or what is equally as objectionable, the laboratory point of view I am prompted at the moment to make this criticism after reading Dr William Edlers article on the reporting of venereal diseases (THE JOURNAL, June 26, 1920, p 1764) His assurance reminds me of the Texas venereal law, which assumes that the man on the street as he runs can diagnose venereal disease His article contains the same threat of revocation of license as the Texas law, notwithstanding that in Texas and in most states the statutes provide that a license can be revoked only on the commission of a crime of the grade of a felony As an employee of the United States Public Health Service, Dr Edler should know that the service will not accept a clinical diagnosis of venereal disease Now, how many physicians can make a laboratory diagnosis, and how many laboratory experts will agree about the diagnosis or obtain a positive diagnosis when the clinical evidence is suspicious, should we turn our cases over to them? This is no rambling assertion but the fruit of experience An important case in the courts in this state recently illustrates the point An expert and disinterested pathologist testified that the case was one of gonorrhea Another witness, equally as expert and disinterested, said that it was not One author says that the gonococcus must be intracellular and another that there must be pus on the slide for a positive diagnosis When we encounter the Wassermann expert we are even more confused regarding our clinical diagnoses Even a government clinic treated a man with herpes for syphilis On a clinical diagnosis, a physician reported a married woman as having gonorrhea The sequel showed that her discharge came from an appendical sinus, and the doctor was up against trouble

Dr Edler attributes his statements about outraged wives and violence to wrong sources or motives The case cited above is the principal reason that causes physicians to be careful in reporting these cases No law that I know of offers to back a physician in court in case he makes a wrong diagnosis or if his diagnosis can be overthrown by a preponderance of witnesses A physician who draws a salary and whose diagnoses are defended by the United States Public Health Service can afford to express positive views, but a great many of us have our living to make by the practice of medicine among our neighbors and must pay our own lawyers if we are forced to go into court.

J H MACKAY, M D, Houston, Texas

[A proof of the preceding was sent to Dr Edler, who replies]

To the Editor —I had hoped in my paper on "The Reporting of Venereal Diseases by Physicians' to have covered the objections offered by the profession as I had heard them That errors in diagnosis and drastic medicolegal consequences were an objection had not up to this minute, come to my attention

Exceptionally, I readily agree, venereal disease diagnostic difficulties are encountered Similarly the same enigma is encountered in all specialties I, too, have seen experts disagree on the diagnosis of scarlet fever smallpox and meningitis, but I always felt that the community, and not the patient, deserved the benefit of the doubt

In its acute and most communicable stage "the man on the street as he *runs* (accent on the last word) can fairly accurately diagnose his malady I feel sure that out of several

hundred thousand cases of venereal diseases reported, the legal complications have been practicably negligible My information is that from the lowest to the highest courts the venereal disease laws, even to the point of seizure of person, have invariably been sustained

I am convinced that if a malpractice suit were instituted against the physician for a mistake in diagnosis, the court would condone his mistake "if he exhibited the skill, care and ability of the average physician in his community" No doubt his state medical society would defend his suit to the limit, and likewise his state board of health, if the suit originated from a report to its office

The Louisiana medical practice act authorizes the revocation of the physician's license for violation of the venereal disease laws I hope that some day the American Medical Association will expel from membership physicians who do not report communicable diseases Shirking obligations of physicians to each other is no more a violation of ethics than criminally contributing to the dissemination of disease—be it venereal or otherwise

WILLIAM EDLER M D, New Orleans

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed Every letter must contain the writer s name and address but these will be omitted on request

TUBERCULOSIS JOURNALS — ARREST OF PULMONARY HEMORRHAGES

To the Editor —1 Please let me know the names and addresses of medical journals devoted to tuberculosis in the United States as well as Europe

2 Is there any special apparatus used in American sanatoriums for arresting pulmonary hemorrhages and if there is please let we know the name of the manufacturer

JORGE SAÉNZ M D Costa Rica

ANSWER —1

American Review of Tuberculosis 2419 Greenmount Avenue Baltimore Monthly $3
Journal of the Outdoor Life 381 Fourth Avenue New York Monthly $1 50
Tubercle London Monthly 25 shillings
British Journal of Tuberculosis 151 West 25th Street New York Quarterly $1 25
Archivos Españoles de Tisiología Diputación 211 Barcelona Spain Thirty pesetas
Revista de Higiene y de Tuberculosis Juan de Austria 12 Valencia Spain Twelve ptas
Revista de Tuberculosis Calle Colon 7 Valencia Spain Ten ptas
Revista de Tisiología Murcia Spain Twelve ptas
Tuberculose s Gravenhage Holland
Zeitschrift fur Tuberculose Dorrienstrasse 16 Leipzig Germany Thirty marks
Beitrage zur Klinik der Tuberkulose Würzburg Germany
Internationales Centralblatt fur die gesamte Tuberkulose Forschung Wurzburg Germany
Tubercolosi Milan Italy
Tuberculosis Internationales Centralbureau zur Bekampfung der Tuberkulose Berlin Germany (This is the organ of the International Tuberculosis Society)

Before the war there were published other tuberculosis journals in France and Italy but no copies have been received recently

2 The only apparatus mentioned for such purpose is the device used in producing artificial pneumothorax These devices may be obtained from any of the medical supply houses advertising in THE JOURNAL

TREATMENT OF LEPROSY

To the Editor —Can you give me some information on the results obtained in the leper colony of Hawaii with the new method for increasing the tolerance of patients to large doses of chaulmoogra oil? Please omit my name P P A Colombia

ANSWER —At the recent conference of state and territorial health authorities with the U S Public Health Service Dr G W McCoy, the director of the Hygienic Laboratory stated that the results obtained in the treatment of lepers at the leprosy investigation station in Kalihi, Hawaii, with the ethyl esters from chaulmoogra oil had been encouraging Following a course of treatment extending over about a year, forty-eight lepers treated according to the new method were paroled in October, 1919, and up to now have remained free from the disease It will require, however, some time—probably years—to determine whether a real cure for leprosy has been discovered

The treatment employed was described in the *Journal of Cutaneous Diseases* in articles by H T Hollmann and A L Dean, the authors concluding that in the use of the ethyl ester of the fatty acids of chaulmoogra oil, subcutaneously, we have a method of treatment superior to subcutaneous injection of the chaulmoogra oil mixtures

In the *Indian Medical Gazette* for April, 1920, recently abstracted in THE JOURNAL there appeared a series of articles on the treatment of leprosy one of which was by Rogers on the use of an ethyl ester of the unsaturated fatty acids of cod liver oil in both leprosy and tuberculosis with apparently distinctly favorable results, although it is recognized that much further experience will be necessary before the exact value of the new preparation can be determined

CHLORINATION OF WATER SUPPLIES

To the Editor —Referring to the editorial on Chlorination of Water Supplies which appeared in THE JOURNAL (Spanish Edition Jan 1 1920) I should like to get more details in regard to this method of water disinfection

ALFONSO QUINONEZ M D San Salvador

ANSWER —A list of articles on the purification of drinking water appeared in THE JOURNAL June 7 1913 page 1813 Articles published since that date follow

Whittaker H A Use of Hypochlorite Capsules for Treatment of Small Quantities of Drinking Water *Am J Pub Health* August 1914

LABELS ON GLASS

To the Editor —Kindly give a method of preparing ink for marking labels on gross tissue specimens which will not be washed off by immersion in the formaldehyd in which the specimens are preserved Please omit name and address S A L

ANSWER —The glass surface to be labeled should be free of grease Any ink may be employed A coat of thin alcoholic solution of shellac or of balsam should be applied over the ink

OLDEST MEDICAL ORGANIZATION

To the Editor —What is the oldest medical organization in the United States? A S A

ANSWER —The Medical Society of New Jersey was organized in 1766 This is the oldest state medical society of which we have record Before this date there were minor societies in Boston and elsewhere

---

Proposed Health Museum.—W J Simpson professor of hygiene and public health in King's College London has suggested the establishment of such a museum to celebrate the means by which we can triumph over preventable disease In such a museum the causes of preventable disease and the means by which they can be prevented would be illustrated practically The museum would be open to all Lectures and demonstrations illustrated by models and the cinematograph should be given and there should be attached a bureau of information —*Medical Press and Circular* 109 105 (Feb 11) 1920

THE FLIGHT SURGEON

A New Specialist in Medicine

W I SHEEP, M D
Major M C U S Army
WASHINGTON D C

The flight surgeon bears the same relation to aviation as does the specialist in preventive medicine to mankind in general, in that the two are concerned with the prevention of disability and the maintenance of physical efficiency As a knowledge of diseases is essential in order to make intelligent efforts for their prevention, so a knowledge of the special ailments to which the flier is subject is necessary in order that they may be prevented or reduced to a minimum

When the United States entered the World War and there began an immediate and great increase in aviation activities, it early became apparent that, after men had undergone a thorough and special physical examination and were found fit to fly, the most important work of the Medical Division of the Air Service was to keep these selected men under constant supervision to see that they remained fit to fly, and to remove from flying those who became unfit The necessity for such a procedure was made obvious by a report from overseas that the British, French and Italians, by information derived from carefully compiled statistics, had come to the conclusion that 90 per cent of aviation casualties was due to troubles with the fliers, 8 per cent to defective aeroplanes, and 2 per cent to the Huns, further that by proper medical supervision of fliers, the British in two years reduced this 90 per cent. of casualties to 12 per cent

These so-called 'troubles" of the fliers were made the subject of special study by competent experts Medical officers were assigned to duty at flying fields for the purpose of obtaining all possible information concerning ills and accidents of fliers, research laboratories for study and experimentation were established at certain of the fields, frequent reexaminations of fliers were conducted and all of the knowledge acquired thereby was assembled and put into shape for the training of medical officers who were to qualify for the special medical work required by the Air Service Thus there evolved a new specialist in medicine—the flight surgeon

The program for the training of many medical officers as flight surgeons for assignment to overseas squadrons was interrupted by the signing of the armistice The work of the pioneer flight surgeons who were on duty during the war at Air Service stations in the United States was of great value New to duties not clearly defined their status not always understood the importance of their services at first not fully appreciated, they showed keen enthusiasm and marked intelligence in the performance of their tasks and, by practical demonstration of their worth, paved the way for the establishment on a permanent basis of the office of the flight surgeon Further these pioneers rendered reports of their observations and experiences which have been of great assistance in formulating the present system of instruction prescribed for medical officers who desire to qualify as flight surgeons

This instruction is given at the central Medical Research Laboratory, and consists of lectures demonstrations and practical work in normal physiology of respiration and circulation and in the physiology of respiration and circulation of the flier when exposed to high altitudes The ability to differentiate the arrhythmias and all types of valvular heart disease is acquired from clinics and lectures Methods of new and special examinations of the ophthalmologic and otologic apparatus are taught, and each student flight surgeon is required to make a number of complete examinations of the eye and the ear In psychiatry the general field is covered by lectures and clinical work, and special attention is devoted to the making of personality studies In psychology the instruction consists of a study of elementary psychologic methods and the psychology of aviation, a subject which has to do with the mental adaptability of the flier to the work required of him In physics, such matters as oxygen supply apparatus, aviators' goggles, and the rebreathing apparatus for the detection of staleness and the classification of fliers are given study and practical demonstration The whole course of instruction requires two months of intensive work

After its completion, and on being assigned to flying fields for duty, flight surgeons are encouraged to take flying instruction and to qualify as air pilots They can thus by experience in the air comprehend the psychology of flying From the study of the sensations produced during flight they gain a wealth of information of inestimable value in dealing with fliers under their charge They have a true appreciation of the stress which at all times the flier undergoes, the symptoms brought on by flying at high altitudes, and the physical and mental exhaustion incident to prolonged flights They may acquire a personal knowledge of the manifestations of flying 'staleness ' that most insidious and dangerous ailment of fliers, which may exist when the subjects themselves are not aware of it but which the competent observer usually detects without difficulty Further, they have a bond in common with their fellow fliers, and it has been observed that on this account greater confidence is reposed in them by the fliers

Of the forty flight surgeons now on duty at Air Service stations, twenty-nine are on flying status which requires that, either as passengers or pilots they take a minimum of ten flights a month Of these twenty-nine there are seven who are qualified pilots and five who are now taking instruction to qualify as pilots

The duties of the flight surgeon are prescribed officially as follows The duty of the flight surgeon is to act as adviser to the commanding officer of flying schools and squadron groups Although under the post surgeon, he has the freedom of independent initiative in all questions of flying fitness of aviators or cadets Subject to the approval of the commanding officer, he is expected to institute such measures as periods of rest recreation and temporary excuse from duty as may seem to him advisable He takes sick call for aviators and cadets and recommends a disposition of cases excused from duty He will visit such cases as may be in the hospital at the post, and consult with the attending medical officer regarding them From time to time he will make routine reexaminations of aviators and cadets also such special examinations as he may deem advisable being assisted therein by data furnished by the Medical Research Laboratory He will live in as close touch with the aviators and cadets at his station as is consistent with the conditions '

The flight surgeon should be out on the line with the fliers during the hours that flying is actively engaged in The mechanicians look over the engine the control gears, the struts and the wings of the aeroplane before it is taken out for flight how much more important it is that the flier the heart and brains of the whole flying apparatus as one flight surgeon expresses it, should be talked with and critically if but momentarily observed before he is allowed to go up into the air

On recommendation of the flight surgeon the commanding officer of an Air Service station may at any time remove a man from flying duty While the most important part of the flight surgeon's work is in instituting measures for keeping fliers in good physical condition it is worth while to state that of 1 500 fliers in the United States in 1919 of whom [illegible]

is a record, 808 were temporarily disqualified for flying on account of physical disability, and thirty were permanently disqualified

The flight surgeon is required to prepare and send in to the office of the chief surgeon, Air Service, at frequent intervals, standardized reports on fliers. Several of these reports deserve special mention in that the information they furnish gives an idea of the valuable statistics which the central office is enabled to compile. The "Crash" report, sent in from a station whenever there is an injury to a flier or serious damage to an aeroplane, covers the date of beginning of training of flier, hours of dual and solo instruction, hours flown during past month, duration of last flight, number of previous crashes, result of crash, cause of crash, type of plane, etc. The "Care of Flier" report is submitted weekly from each station. It gives the total number of fliers on duty at the station, the number of hours of flying, number of fliers temporarily removed from flying duty by the commanding officer on recommendation of the flight surgeon, cause of disability in each case reported on, statement as to whether physical examination records are on file for all fliers at the station, etc. The "Physical Examination for Flying" report on each flier is sent in semiannually and covers a thorough and complete physical examination, embracing the new standards required for the examinations of the eye, the ear and the nervous system.

The official status of the flight surgeon is prescribed in the following instructions, which have been issued by the director of Air Service to commanding officers of Air Service stations:

"1. Commanding officers of Air Service stations where flying is being carried on will consult with the flight surgeon in all matters pertaining to the mental and physical fitness of the flying personnel of his command. The term 'flying personnel' will include all who make aerial flights, such as instructors, flying officers, and individuals undergoing flying instruction.

"2. Commanding officers will take full advantage of the assistance that can be rendered by the flight surgeon of his field. Such matters as the amount and kind of physical exercise required by individuals engaged in flying, the state of fatigue of the individual flier, the amount of sleep necessary, food problems, reexaminations, and all field conditions affecting the welfare of the flying personnel will be made the subject of conference between the commanding officer and the flight surgeon. Commanding officers should obtain the recommendation of the flight surgeon on applications for leaves or furloughs from those engaged in flying when physical incapacity is made the basis of application.

"3. The flight surgeon will be listed on any form for clearance in vogue at an Air Service station and no flying officer or any one undergoing flying instruction will be transferred from a station without first obtaining a clearance from the flight surgeon. On notification of transfer the flight surgeon will forward to the flight surgeon of the new station the reexamination report and laboratory rating chart of the individual being transferred.

"4. Flight surgeons will be encouraged in every way to take flying instruction. On completion of the prescribed tests, flight surgeons will be rated in the same manner as other flying officers. Applications for flying training should be made through the surgeon to the station commander, and will be accompanied by the necessary report of physical examination.

"5. On recommendation of the surgeon, station commanders will authorize medical officers of the command, who are physically qualified and make application, to take flying instruction. This will enable one of these officers to take the place of the flight surgeon when the latter for any reason is not available for that duty.

"6. Unless an absolute necessity exists therefor, flight surgeons will not be diverted from their regular duties to perform routine post duties when this service can be performed by other medical officers. Flight surgeons should devote all the time possible to the close and constant supervision over flying personnel.

"7. The flight surgeon of an Air Service station will not be detailed as a member of a board of officers convened to examine into the efficiency of a flying officer when it can be avoided. His services will be of more value when called before a board as an expert witness to give testimony relative to physical fitness, etc., of the officer under investigation."

The flight surgeon has come to stay. Instances without number of the practical value of his work could be related. In an analysis of statistics of 1,250 crash reports rendered by flight surgeons, which covers a period from July 1, 1918, to Jan. 1, 1920, and which includes reports on crashes from all stations in the United States at which flight surgeons were on duty, the cause of crash due to physical impairment of fliers when definitely ascertained to have existed, is given as only 2 per cent. Forty-seven per cent. is reported as due to 'poor judgment." It is probable that a relatively small number of these crashes were due to physical impairment, but for lack of more exact information, were not placed in that class.

Undoubtedly the work of the flight surgeon has resulted in the saving of many lives and much valuable property.

Office of Chief Surgeon, Air Service.

OPHTHALMOLOGIC TEACHING

At the annual congress of the Ophthalmological Society of the United Kingdom, the president, Mr. J. B. Story, delivered an important address on this subject. He said that the Council of British Ophthalmologists had already urged the General Medical Council to adopt two reforms—first, to make three months' attendance at an ophthalmic clinic obligatory, and secondly, to have an examination by ophthalmic surgeons as part of the final examination. The General Medical Council accepted the first and rejected the second, a most astonishing thing to those who know well that medical students have no time to waste on subjects that are not necessary and in which examination is not compulsory. There are two reasons why a certain knowledge of ophthalmology is necessary for every person permitted to practice: (1) because the vast majority of physicians cannot escape from having to diagnose and treat diseases of and injuries to the eye when no specialist can be obtained, and (2) because in many serious diseases the evidence afforded by ocular conditions is most important, and often the ocular symptoms are those which induce the sufferer to seek medical advice. For instance, interstitial keratitis may be the first evidence of infantile syphilis, even before the eruption of the teeth described by Jonathan Hutchinson, and acquired syphilis may show itself in the choroid, iris or retina long after the patient has forgotten the primary disease completely. Ocular tuberculosis may be the first visible manifestation of that disease, and the ocular signs are important in tabes, disseminated sclerosis, meningitis and other intracranial lesions, diabetes, nephritis and arteriosclerosis, to mention only a few serious and not uncommon affections. In many of these the ocular signs may be mainly naked-eye appearances or fairly easily observed ophthalmoscopic lesions. The final decision of the General Medical Council is said to be that the hospitals should, or may, refuse certificates to students who do not acquire sufficient knowledge, thus shuffling off the responsibility thrown on it by act of Parliament and placing it not on the licensing bodies over which it has control, but on the medical staffs of hospitals. It has been objected that if an examination in ophthalmology is instituted at the final, it will overload the curriculum, and that other special branches of surgery will claim a similar privilege.

As regards the first objection, the special clinical examination has been the rule in every one of the Irish licensing bodies for some thirty years and has not caused overloading As regards the second, it has already been pointed out how great is the importance of ocular signs and symptoms in serious constitutional diseases, an importance much greater than can be assigned

Book Notices

NEITHER DEAD NOR SLEEPING By May Wright Sewall Urthan Introduction by Booth Tarkington Cloth Price $2 50 Pp 320 Indianapolis The Bobbs Merrill Company 1920

The author of this latest addition to the host of books on spiritualism is a woman who—according to the advertisements—for many years headed a well known girls' classical school, was organizer of the National Council of Women of the United States and of the International Council of Women, and was for nine years chairman of the executive committee of the National Women s Suffrage Association It is interesting to reflect on the fact that during all the time that she was carrying out such work she was apparently living in a maze of unrealities, in a veritable dream state Evidence of her credulity in matters spiritualistic is the following incident

One evening as we sat in the library in ordinary conversation with the expectation that later her gift of automatic writing might be used in my service I told her of the scenes I had witnessed at Oberammergau in August and showed her some photographs of the chief actors Holding out to her a photograph of Judas I asked her to look at it and compare it with another face that we had been analyzing Reaching out her hand she said Where is it?

I replied Why you took it from my hand

No I took nothing I extended my hand to take it but although I saw the photograph in your hand there was nothing for me to take

This seemed incredible to us for it was for both the first experience of instantaneous disintegration"

We were alone in the room of which neither door nor window was open I had held the photograph studying and discussing it before and while I passed it to my friend *who seeing it in my hands found* nothing there when her hand reached mine! We looked everywhere removing every paper from the desk by which we sat going over and over again the basket holding my summer s harvest of photographs It was nowhere to be found When very late the automatic writing began my husband s first sentence was It is useless for you to look for the photograph of Judas ——— took it

In amazement I cried '———! How can that be? What does he want with it?

My husband replied It was a singular thing for ——— to do but he wished to show it to Judas he has done so and Judas is not at all pleased with it

In reply to further expression of incredulity protests and questions my husband aid ——— promises to return the photograph when you least expect it'

In May 1901 while in New York attending a conference of the officers of the National Council of Women I spent an evening with my friend Miss G who produced automatically a dictation from my husband for me On this occasion I had made no reference to the incident narrated above but my husband wrote ——— has been prevented from returning the photograph of Judas by the fact that the latter feels deeply offended by its production and is unwilling that a photograph which he regards as a caricature shall be restored and preserved

Aside from its general interest for the neurologist and psychiatrist, a feature of medical interest is the fact that the author was a sufferer from interstitial nephritis as she states and that she was cured by following the directions—communicated mediumistically—of a physician of the middle ages, now residing in one of the spheres of one of the planes to which mortals pass when leaving this terrestial home These instructions caused her to take materialistic massage treatments from a Swedish masseur vapor baths and exercises They also caused her to undergo periods of starvation and to secure mental relaxation by the study of piano playing under spiritualistic instruction of the great Anton Rubinstein also residing in one of the spheres of one of the planes It may be said that Mrs Sewall s chief communicant from the shores beyond was her husband who died in 1895 and who has been communicating regularly with her ever since The communications have come through trumpet-speaking slate-writing automatic writing ouija boards or the other trumpery methods indulged in by professional mediums In her converse with those who have gone before, Mrs Sewall spoke with numerous celebrities, including, incidentally, Mesmer Many of her conversations are interesting as literary curiosities The book is an amazingly fantastic document It is a pity that such books are advertised to and are being read by many persons of uncritical judgment

THE DIAGNOSIS OF NERVOUS DISEASES By Sir James Purves Stewart K C M G C B M D Senior Physician to the Westminster Hospital Fifth edition Cloth Price $11 Pp 584 with illustrations New York E B Treat & Company 1920

This well known and excellent work well deserves to appear in a new edition As stated in the preface 'from the kindly reception accorded to former editions of this work it is not unreasonable to infer that it has probably been found of some practical use As indicated in the title this is strictly a book on diagnosis Chapters are devoted to various symptoms such as coma convulsions, aphasia, pain reflexes postures and gaits Chapters on war neuroses and organic war lesions of the nervous system have been added Lethargic encephalitis is lucidly considered in its various relations As an example of the author s broadness of view we may mention that in discussing the difficult differentiation between *chorea facial tic and facial spasm he brings out the* valuable diagnostic points and interpretations contributed by French and American observers In fact, this author is singularly free from being insular' in his views and knowledge Any contribution which has proved fruitful in neurology is given a fair mention whether emanating from home or abroad, from friend or foe Freudians may complain that sufficient stress is not laid on the value of psychanalysis in the diagnosis of the neuroses, but the author's conservatism in this regard is shared by the overwhelming majority of neurologists everywhere The publishers work as regards print and illustrations also deserves praise

THE FACULTY OF THE COLLEGE OF PHYSICIANS AND SURGEONS COLUMBIA UNIVERSITY IN THE CITY OF NEW YORK Twenty Four Portraits By Dorri U Jaeger with a Foreword by Samuel W Lambert M D A B A M Boards Price $10 New York Paul B Hoeber 1919

This is a well worked up volume containing a frontispiece showing the entrance to the College of Physicians and Surgeons of Columbia University, a foreword by Dr Samuel Lambert and following this twenty-four large portraits of *the chief members of the present faculty The portraits are* nicely printed rotogravures, with artistic backgrounds Not all are so clear as they might be, and it would seem that clearness of the features has been somewhat sacrificed to artistic presentation Similar publications were issued by the college in 1846 and in 1875 As evidence of the decided historical value is the fact that the 1846 picture contains the photographs of Willard Parker John B Beck Alex Stevens, Joseph M Smith John Torrey Robert Watts and Chandler R Gilman and the group of 1875 contains the pictures of T Gaillard Thomas Thomas M Markoe Alonzo Clark and John C Dalton If every institution of importance could publish a similar work occasionally—say every twenty five years—the *results would form a record of decided personal* interest and of historical value To the medical graduate of any college it means much to have a permanent memento of his teachers in such a satisfactory form Columbia University is to be congratulated on having set such an excellent pace to the movement as is marked by the high quality of the present volume

PERSONAL BEAUTY AND RACIAL BETTERMENT By Knight Dunlap Professor of Experimental Psychology in the Johns Hopkins University Cloth Price $1 Pp 95 St Louis C V Mosby Company 1920

This is a reprint of an address delivered before several different organizations during April 1917 and later published in the *Psychological Review* for May 1918 The address is divided into two parts covering the significance of beauty and the conservation of beauty It indicates the author s belief that the predominant ideal in marriage is the procreation of children and it calls attention to various unsatisfactory conditions of present sex relationship *It does this* before defining the factors governing sex attraction It is a well written thesis

Medicolegal

Effect of Receiving Check "In Full of Account"

(Booth v Dougan (Mo) 217 S W R 326)

The St Louis (Mo) Court of Appeals affirms a judgment in favor of the defendant who was sued by a physician for a balance of $447 claimed to be due on account after the physician had indorsed and collected through the bank a check for $200 reading 'In full of account to date," which the defendant had sent to him The court recognizes the rule to be that when a certain sum is due from one to another, the payment of a lesser sum is no discharge as to the remainder, notwithstanding an agreement to that effect, because the latter agreement is without consideration But such rule, the court says, does not apply when the amount due is disputed or unliquidated When a claim is unliquidated, any sum no matter how small, given and received in satisfaction of the demand, will legally satisfy it, however large the claim may be. A debt or demand is liquidated when agreed on by the parties or fixed as to the amount by the operation of law The account in this case was made up of charges for visits made by the plaintiff, as a physician in attendance on the defendant and his family, from Nov 4, 1911, to May 30, 1915 and totaled $1,347, on which payments were credited, of $200 in 1912, $200 in 1913 $300 in 1914, and $200 in 1915 It was admitted at the trial that it was not necessary for the plaintiff to prove each of his items in detail, but that it would be conceded that he would testify to the correctness of each item. The defendant contended, however that the last payment was made by him and accepted by the plaintiff as in full of all amounts due the plaintiff In no sense could this be said to have been a liquidated account While it was true that the defendant did not dispute that the services had been rendered and that the charges made for them were reasonable, he nowhere admitted that he owed them On the contrary, when his attention was called to the account rendered just before he sent his check for the last payment, he called the plaintiff's attention to the fact that they had before settled on a compromise basis and proposed to do that here, and on the plaintiff's stating that his account was about $400, the defendant stated that he would pay $200 if the plaintiff would accept that in full It was true that the plaintiff denied this conversation over the telephone, but that was for the jury, the defendant having distinctly testified to it It was under these circumstances that the defendant made out his check for $200, writing on it that it was in full transmitted it by letter, calling attention to that sum and the plaintiff accepted the check and cashed it Under these circumstances the plaintiff was bound by his act and could not claim anything over and above the $200 His reception and retention of the $200 in full payment of his account, that not being a liquidated account, or an account stated, was conclusive on him

Liability of Physicians for Bad Dental Work

(Nisbet v Vandiver (Ga) 101 S E R 761 Eichholz v Poe et al (Mo) 217 S W R 282)

The Court of Appeals of Georgia, Division No 1, in the case of *Nisbet v Vandiver*, affirms a judgment in favor of plaintiff Vandiver, a boy about 8 years of age, for damages in an amount not stated by the court, for alleged permanent injury done to him by defendant Nisbet a licensed practicing physician and surgeon, in what he did, or failed to do, in extracting a lower tooth for the plaintiff It was alleged that the defendant failed to administer properly the cocain used, and failed to exercise a reasonable degree of care, skill and diligence in that he used an unclean and infected needle to administer the cocain, injected unsterile cocain, was not careful as to selecting and using clean forceps or instruments, and did not properly diagnose and treat the case afterward, as a result of which gangrene developed, which required a removal of part of the jawbone and a disfiguring opening of the chin The defendant denied the charges of negligence, and averred that, if any gangrene developed, it occurred after his connection with the case had terminated, and was in no manner caused by him The court, however, thinks that there was evidence to support the verdict for the plaintiff

In the case of *Eichholz v Poe et al*, in which two physicians and a dentist were the defendants, the Supreme Court of Missouri, Division No 2, reverses an order of involuntary nonsuit and remands the case for a new trial The court says that the plaintiff was a blacksmith, who worked at his trade until he went to the hospital where the defendant physicians operated on him and removed a kidney On the day after the operation he had a toothache, of which he notified the physicians, and one of the physicians called his dentist, the other defendant, who examined the tooth, applied some lotion to stop the pain, went away, but returned that evening, extracted the tooth and broke the jaw in so doing The plaintiff did not call any supporting witness in his behalf, either lay or expert, although he might have called the nurse who attended him at the hospital, or he might have called the physician who treated him after he discharged the defendants At the close of his case the defendants demurred to the testimony, and their demurrers being sustained the plaintiff suffered an involuntary nonsuit The defendants contended that the demurrers were properly sustained because there was no proof in the record of any negligence on the part of the defendants, and because there was likewise no proof of a causal connection between the act done and the injury suffered The plaintiff charged in his petition that, while he was in a painful and weakened condition resulting from the operation for the removal of the kidney, the defendants negligently carelessly and unskilfully extracted one of his teeth and in so doing fractured his jaw, and thereafter failed properly to care for and treat the case in consequence of which blood poisoning ensued Where, as here, negligence is charged and that it resulted in the injury complained of, both must be affirmatively proved except as to causal connection in cases in which it is supplied by statute The causal connection in this case not being supplied by statute, it must be proved the same as negligence But it is not necessary that negligence and causal connection between it and the injury be established by direct and positive testimony It may be shown by circumstantial evidence inferences legitimately drawn from physical facts which are disclosed by the record Thus either negligence or causal connection may be inferred by the jury The proximate cause of the injury was established sufficiently by the testimony of the plaintiff, who swore that his jaw was fractured in the act of extracting the tooth and the extraction of the tooth being under the management and control of the defendants the court thinks was sufficiently out of the ordinary course of that which usually happens when ordinary care and skill are employed, to warrant the jury in finding, in the absence of explanation by the defendants, that the tooth was negligently extracted

Alcoholic Insanity as a Defense for Murder

(Collier v State (Okla) 186 Pac R 963)

The Criminal Court of Appeals of Oklahoma, in affirming a conviction of murder, says that the principle is everywhere recognized that voluntary intoxication is no justification or excuse for crime and is no excuse for homicide, though carried to the extent of producing incapacity to control the mind and will According to the syllabus by the court, in a prosecution for murder, alcoholic insanity, or mental incapacity produced by voluntary intoxication existing only temporarily at the time of the homicide is no justification or excuse therefor To constitute insanity caused by intoxication a defense in a trial for murder it must be insanity caused by chronic alcoholism, and not a mere temporary mental condition Insanity, though superinduced by excessive and long-continued indulgence in alcoholic liquors and known as "delirium tremens," or "mania a potu" renders a person so afflicted irresponsible for his acts if it be of such a character as to deprive him of the mental capacity to distinguish between right and wrong as applied to the particular act whether he be under the influence of liquor at the time of the commission of the act or not, but to do so, his afflic-

tion must be settled or fixed insanity, not a mere fit of drunkenness A person not previously laboring under such a disease or affliction, who voluntarily becomes intoxicated to such an extent and for such a period of time as to cause unconsciousness of his acts, is not irresponsible under the law for the acts done by him while in such mental condition

Under the penal code of Oklahoma homicide is murder "when perpetrated without authority of law and with a premeditated design to effect the death of the person killed, or of any other human being," and evidence of intoxication is admissible to show an absence of the premeditated design to kill, for the purpose of determining whether the offense was murder or manslaughter, and a state of intoxication which will reduce homicide from murder to manslaughter in the first degree must be of such character and extent as to render the defendant incapable of entertaining or forming a design to effect death And this question is for the jury to determine. Intoxication, either voluntary or involuntary, is to be considered by the jury in a prosecution for murder in which a premeditated design to effect death is essential, with reference to its effect on the ability of the defendant at the time to form and entertain such a design not because, per se, or in and of itself, it either excuses or mitigates the crime but because, in connection with other facts an absence of malice or premeditation may appear And the court says that where intoxication is resorted to for the purpose of blunting moral responsibility, it only increases the culpability of the defendant

(Continued from page 198)

Problem of Forceps Prehension in Obstetrics

DR WILLIAM GILLESPIE Cincinnati Most writers on and teachers of obstetrics tacitly assume that the tyro can perform a forceps extraction properly with axis traction instruments, provided certain simple rules of procedure are followed The truth, however, is that most writers have circulated gross misconceptions about the use of forceps in their textbooks, and many common errors about axis traction have crept into the practice of the average obstetrician The pubic joint may be torn asunder by the force of misguided axis traction, so it is apparent that the proper use of this tremendous force must be more judiciously taught and practiced While the posterior surface of the pubes furnishes the best guide as to the axis of the pelvis in applying the blades of the forceps, there are special advantages in mastering their cephalic application as well Such competence will enable the obstetrician to avoid cerebral lesions of the new-born, the result of misapplied blades and pressure. It is quite possible by an intensive study of the mechanism of labor as well as the principles of axis traction to use forceps for the high operation even with the head floating above the brim of the pelvis, also for canting the head past the promontory and delivering through flat pelves, even in face presentations

Old and New Technic in Operating for Cataract

DR DERRICK T VAIL Cincinnati The old or combined capsulotomy method of operation is faulty because it is applicable only to ripe or nearly ripe cataracts I would encourage those who undertake the operation for cataract to adopt Smith s method throughout in every case in which the lens shows a disposition to be delivered without strain, and as a method of last resort in case of imminent disaster The best time to operate for cataract is before blindness and senility have set in I operate when the patient can no longer read newspaper print with his best glasses in ordinary light

Choice of a One-Stage or Two-Stage Operation for Cataract

DR ROBERT SATTLER Cincinnati For a large majority of cases of relatively far advanced partial or complete senile cataract favorable and ready for operation with functional examination urinalysis and commonly accepted surgical risks in their favor the complete operation is justly preferred and has become an almost universal practice on account of the advantages of only one hospital experience For the exceptional cases a two stage operation is substituted.

Polycystic Kidney

DR F C HERRICK Cleveland Undoubtedly some cases of polycystic kidney give such a prominent family history of an hereditary tendency as almost to justify the term "congenital" as applied to the condition occurring in adults The surgical treatment of this condition has been chiefly limited to its complications of stone and infection Nephrectomy is absolutely contraindicated Experiments have shown that the cystic pressure limits the renal circulation and that evacuation of the cysts as a therapeutic measure during acute retention would seem to be justified

Causes and Treatment of the Conditions Underlying High Blood Pressure

DR LEWELLYS F BARKER Baltimore High blood pressure appears to depend chiefly on a narrowing of the lumina of the arterioles in the precapillary areas It is at first functional and caused by hypertonus of the arterial musculature, though later it assumes a partly organic character the result of arteriosclerosis The different types of chronic arterial hypertension probably represent different stages in the development of the same fundamental process which may advance with variable rapidity and with variable associated involvements of cardiovascular renal cerebral and other structures in different cases When recognized early the process may often be arrested or so delayed in its progress that patients may live comfortably for many years before troublesome symptoms or dangerous complications occur In the later stages of the process much can be done to ameliorate symptoms and to ward off dangers, though in the actual end stages both patients and physicians do better bravely to face reality, accepting the inevitable rather than through wishful thinking increase suffering by resorting to meddlesome therapy that attempts the impossible To prevent the development of the pathologic process underlying high blood pressure, one should first get himself well born without constitutional inferiorities and then should avoid intoxications and infections and satisfy his physical, economic social, educational esthetic and ethical desires in a well balanced way, so ordering his activities that he will secure the highest self realization possible in the service of the society in which he lives

Peripheral Nerve Injuries

DR LEWIS J POLLOCK Chicago The striking feature of the clinical picture of early nerve lesions is the large percentage of marked and rapid improvement There were probably 10 000 peripheral nerve lesions sustained in battle by the American Expeditionary Forces To my knowledge not more than 3 000 cases were classified as peripheral nerve lesions in the hospitals of the United States In other words, two thirds of the patients had so far recovered on reaching home hospitals that their nerve lesions were considered as of minor importance From the cases coming under my personal observation I would conclude that no more than one seventh of all cases should come to operation One must be able to evaluate the paralysis of a mixed nerve injury and to avoid the mistake of misinterpreting accessory muscle movement and anastomotic nerve supply factors that account for the miraculously rapid recoveries following resection and suture of peripheral nerves as reported by surgeons

Arteriosclerosis in Man—It seems to Norris that clinical arteriosclerosis may simply be an involutional process, a part and parcel of aging, or it may be mechanical or toxic in origin Just how this involutional process is brought about is not known, but it seems more than likely that it will ultimately be shown to be the result of chemical changes associated with the bodily metabolism which exert their effects on the individual visceral, vascular and somatic cells, either directly or through the mediation of the ductless glands

Arteriosclerosis in Wild Animals—The study reported by Fox is a part of a general scheme of the Laboratory of Comparative Pathology at the Philadelphia Zoological Garden to place on record a review of the lesions found among the animals at the necropsy table Mammals subjected to necropsy 1 806 angeitis, 33 or 1 8 per cent , birds subjected to necropsy, 3,571 , angeitis 53, or 1 4 per cent

Two Cases of Fibrinous Bronchitis—That cases of fibrinous bronchitis would probably not be as rare as the literature would indicate if the sputum of patients were more carefully examined is the belief held by Walker The diagnosis of fibrinous bronchitis is made only by the finding of long branching bronchial casts in the sputum of persons who do not have tuberculosis, diphtheria pneumonia or some other primary bronchial disease Fibrinous bronchitis is an idiopathic disease, the cause of which is unknown Although it may be due to a neurosis, it seems more closely allied to bronchitis, bronchiectasis and asthmatic bronchitis

Curves of Sugar and Urea After Standard Protein Meals—One important finding made by Jacobsen and Edwards is that after a standard meal of 50 gm protein there is generally a rising curve of urea in the blood, which as a rule, is higher in patients with severe diabetes or nephritis than in normal persons The blood-urea level is not a reliable index of nitrogen retention In some instances, for example in diabetics, it may possibly bear some relation to the rate of protein catabolism On the whole, it seems to be governed by so many factors of the previous diet fluid retention and unknown metabolic conditions that by itself it forms an uncertain basis for conclusions The plasma sugar of normal persons is not appreciably altered by this quantity of protein The substances in nephritic blood, which react like sugar to the Benedict test, are increased after a protein meal A typical curve of hyperglycemia follows the ingestion of protein in suitably severe cases of diabetes This is likely to be missed if active symptoms of glycosuria or hyperglycemia are present, as the effect of 50 gm protein could scarcely be expected to be noticeable amid such a surplus of sugar Rarely also the rise may be slight in extreme exhaustion Under the conditions of strict diet treatment this reaction to a standard protein meal may be used as a measure of the severity of diabetes and a guide both to the protein allowance and the total ration, and it has lately been used for these purposes in this clinic

Hyperglycemia in Relation to Immunity—The experiments recorded by Rhodenburg and Pohlman show a phenomenon associated with the process of immunity which has hitherto escaped observation An analysis of the hyperglycem a following repeated injections of the same substance indicates that the hyperglycemia is one which gradually increases in intensity up to a certain level of sugar concentration in the blood, that it keeps this level of intensity for a short period and then returns to a normal figure even though the immune bodies are still present in the blood The experiments further suggest that the hyperglycemia which follows the injection of substances generally supposed not to be capable of inducing antibody formation (i e, fats, polypeptids) may serve as a method for testing the reactions of the body when neither precipitins, agglutinins nor lysins are demonstrable From a practical standpoint the absence of a hyperglycemia after the injection of a given substance known to induce hyperglycemia might be taken to indicate the point of maximum antibody production in the individual or animal in question

Antipneumococcus Serum in Pneumonia—The comparison submitted by Gray is a mortality of 16 7 per cent in 234 serum treated cases of pneumococcus pneumonia, with a mortality of 53 6 per cent in 1,684 similar cases treated in other respects by the same methods, except that they received no serum In other words, the death rate in the serum treated cases was somewhat less than one third that in the cases compared

Secondary Hypertrophic Osteo-Arthropathy—To the five cases of this condition now on record, Bryan adds one occurring in a man aged 29 Fifteen years ago the patient was run over by a wagon and had the middle third of the right arm badly cut and bruised The wound healed readily, leaving considerable scar tissue Five years after the accident, a rapidly growing mass appeared in the scar tissue It was excised, but recurred within a year and was again removed A year later excision was again attempted and still later a fourth excision was done When first seen by Bryan, there was no apparent bony involvement, no evidence of glandular involvement and no clinical roentgen-ray evidence of pulmonary involvement A thoracoscapular amputation was done from which the patient made an uneventful recovery Examination of the specimen showed a spindle and small cell sarcoma Sixteen months following the operation the patient

urned with a large mass at the site of the amputation, with nical evidence of pulmonary involvement and complaining pain in the knees Roentgen-ray examination showed fluid the chest with multiple rounded shadows of increased nsity throughout both lung fields, typical of metastatic lignancy The hand and the feet showed marked clubbing the phalanges with irregular burrlike expansion of the tal ends of the phalanges The metatarsals metacarpals iae fibulae, femurs, the remaining radius, ulna and merus, all showed a marked laminated ossifying periostitis ich was sharply differentiated from the cortex of the bone, a rule this periosteal reaction was confined to the diaphs and was most marked near the distal ends of the bones ere was no involvement of the skull, vertebrae, scapula or vic bones There was no apparent erosion of the joints attempts of fusion of the reaction zone with the shaft as n in some of the older cases

Roentgen-Ray Diagnosis of Liver Cirrhosis—The irregular tline of the hobnail liver was shown by Pirie, with the ntgen rays by injecting into the peritoneal cavity a liter oxygen and making roentgenogram in the upright position

even Cases of Cervical Sympathetic Nerve Injury Causing Oculo pupillary Syndrome S Cobb Boston, and H W Scarlett Philadelphia—p 636
editations on Morale D Gregg Wellesley Mass—p 654

Endocrine Deficiency in Neurologic Conditions—Supranal inefficiency in neurasthenia pituitary disfunction in graine and in epilepsy are the conditions to which Timme rects attention

Value of Intraspinal Therapy—The practical conclusion awn by Hassin is that intraspinal therapy of cases in which pecially the parenchyma of the brain is deeply involved, as general paresis, has not physiologic support In those ses in which the trouble is in the subarachnoid space itself, in cerebrospinal meningitis the injection is wholly justid for given in suitable doses it may produce results But used in intraspinal therapy, in very small doses (fractions a grain of arsphenamin), therapeutic results can hardly be pected Hassin believes that the favorable reports of the vift-Ellis method of treatment by some reliable observers n be explained not by the action of the intraspinal injecons, but by that of the intravenous ones

Arsenic in Spinal Fluid—According to Hall and others sphenamin given intravenously in 0.6 gm doses may be tected in the spinal fluid in from 25 to 35 per cent of e cases Irritation of the meninges by the injection of itoserum into the spinal canal does not increase this pertntage

Cervical Sympathetic Nerve Injury Causing Eye Symptoms Cobb and Scarlet claim that lesions affecting the seventh id eighth cervical and first thoracic roots through which mpathetic fibers run, cause the most severe and typical ulopupillary syndromes

Differential Diagnosis of Ureteral Obstruction from Lesions of Other Abdominal Organs O S Fowler Denver—p 159
*Subcutaneous Use of Lobelia. A J Nossaman Pagosa Springs—p 164

Value of Laboratory Findings—The five cases cited by Moleen are said to emphasize that all laboratory procedures must be valued only as contributory evidence as modifying but not contradictory to clinical phenomena—that the preponderating evidence belongs to clinical manifestations of disease In the absence of clinical evidence of a nervous lesion the presence of a positive Wassermann reaction is not to be ignored inasmuch as lipoids giving such a reaction may exist in the body fluids probably derived from sequestered or isolated foci without or prior to the occurrence of disintegrative lesions of the nerve structures

Lobelia a Valuable Eliminant.—Nossaman recommends the use of lobelia as an eliminant He administers it hypodermically from 10 minims to 1 dram repeated as necessary every two to four hours in acute cases, and once or twice a day in chronic cases He believes that lobelia has not been used as much as it should be

Heterotransplantation of Thyroid Gland L Loeb St Louis—p 765

Active Immunity Against Experimental Pneumonia—The subcutaneous injection of small doses of living virulent pneumococcus Type I was found by Cecil and Blake to stimulate in monkeys a degree of active immunity sufficient to protect them against experimental pneumococcus pneumonia of homologous type If administered [illegible] only large

dose, it likewise renders the monkey immune to a subsequent pneumonia of homologous type Vaccination of living virulent pneumococci may or may not be followed by a severe constitutional reaction, depending on the natural resistance of the individual The severe reactions are caused by the development of a pneumococcus septicemia, which is either temporary, or leads to a fatal termination The mild reactions are not accompanied by septicemia, and there are no symptoms other than a slight elevation of temperature and moderate leukocytosis Vaccination with living virulent pneumococci does not induce severe reactions and is not accompanied by pneumococcus septicemia

Active Immunity Established by Experimental Pneumonia—According to Cecil and Blake experimental pneumococcus Type I pneumonia in monkeys confers on them an immunity which protects them against subsequent infection with the homologous type of pneumococcus The duration of this immunity has not been determined A certain amount of cross immunity against the other fixed types of pneumococcus pneumonia may or may not be present following experimental pneumococcus Type I pneumonia The degree of cross immunity is difficult to measure and probably varies widely with the individual monkey Experimental pneumococcus Type IV pneumonia in monkeys confers slight if any protection against subsequent infection with the same or with an homologous strain of pneumococcus Type IV There is not evidence in monkeys of cross immunity against pneumococcus Type IV pneumonia following pneumococcus Type I pneumonia, and conversely, pneumococcus Type IV pneumonia confers no cross immunity against pneumococcus Type I pneumonia

Heterotransplantation of Thyroid—The heterotoxins Loeb says injure the transplanted cells directly and make them thereby susceptible to additional injurious influences, such as lack of good vascularization fibrous character of the stroma causing compression of acini, and direct invasion and destruction of a limited number of acini by fibroblasts and lymphocytes These factors lead to a constant dying of transplanted parenchyma which is not compensated for by any appreciable new formation of tissue The primary factor in the destruction of the heterotransplant is the injurious effect of the heterotoxins They change the metabolism of the transplanted cells which now exert an effect on the blood vessels, connective tissue cells, and lymphocytes which differs in certain respects from that exerted by normal as well as auto and homoiotransplanted cells These secondary reactions contribute to the destruction of the heterotransplants

Paralysis Agitans and Syphilis—In nine of twelve consecutive cases of paralysis agitans seen by Oettinger evidence that ranges from reasonably presumptive to certain that a some time syphilitic infection occurred, presents a sufficiently high percentage to be notable, and so, probably, merits further observations Interesting is the fact, that the blood Wassermann was negative in every case tested, including those instances where the history disclosed certain syphilitic infection and the further fact that one of these had previously given a positive blood and spinal reaction None of these patients presented symptoms that could be interpreted as characteristically syphilitic in origin Oettinger does not suggest that Parkinson's disease is a phase of syphilis, but it seems plausible that syphilis may be a determining factor in the disease by effecting loss in organic defense to a virus which finds its most potent expression in characteristic tissue change, namely degeneration to a greater or less extent of the corpora striata

Sarcoma of Stomach—A woman, aged 22 whose father died of gastric cancer, was ill for one year with symptoms referred entirely to her stomach The clinical diagnosis of

intragastric tumor made by Basch was confirmed roentgenographically and by operation A typical Mayo cautery resection was made, followed by a posterior gastroenterostomy No other tumor masses were found Microscopic examination showed that the tumor was a large round cell sarcoma Fifteen months after operation the patient was entirely free from symptoms and had gained 50 pounds in weight Basch believes that these cases are far more common than has hitherto been believed to be the case.

Herniotomy Technic —The main features of Woolsey's method of operation are obliteration of the inguinal canal and the external abdominal ring, and fortifying this part of the abdominal wall by (1) suture of the entire thickness of the musculo-aponeurotic wall along the upper or inner margin of the incision to the deep surface of Poupart's ligament, (2) by overlapping the lower flap of the external oblique aponeurosis in front of the upper flap and (3) transplanting the cord so it will lie superficially to the aponeurosis Woolsey says he has been operating on hernias according to this method since 1895 but never published the technic.

*Fibroma of Mesentery A Jacoby New Orleans —p 66

Chronic Intestinal Toxemia —The two measures which Bassler says his experience with thousands of cases have proven to be of the most value are diet and bacterial treatments The diet should be a carbohydrate and hydrocarbon one in the putrefaction (indolic) case, a high protein in the fermentation (saccharobutyric) case, and one of carefully weighed foods so as to keep down to a minimum caloric value in the mixed form Lactose by mouth is of no value, but the plan of feeding coarse uncrushed grains, somewhat sustains an acidity if a suitable bacteriology is present in the gut—which unfortunately is seldom met with in the putrefaction case, but when this is present a lactic acid carbon dioxid result can easily be accomplished What must always be kept in mind, by dietetic treatment alone, is that most of the infecting forms of bacteria in the gut are facultative and while they may be influenced favorably by diet, this is transitory and not dependable in therapy after a few weeks' time Since no purgation should ever be permitted in these cases, the bowels must be regulated by the well known dietetic and physical measures, and not even by irrigations or enemata of any sort The bacterial treatments are based on the findings in complete examinations of the stools and urine under known conditions of diet This diet should be the normal one for the age work and weight of the individual Suitable diet lists are given

Fibroma of Mesentery—Indigestion jaundice and constipation were the first symptoms complained of by Jacoby's patient Pain led the man to press his hands against his abdomen, and then he felt a mass which physicians later believed to be a "gas tumor but at operation it was found to be a tumor located in the mesentery and very close to the ileum Its removal could be considered only by a resection of that part of the ileum in the mesentery of which it was located The bowel was excised with the cautery, tied and the ends inverted with several rows of chromic catgut and one of silk The ends were placed side by side like the barrels of a shotgun and a lateral anastomosis done This method of anastomosis does away with the danger of fecal stasis in the blind ends of the gut Jacoby does not claim originality for the method

Digitalis in Large Doses —The administration of the tincture of digitalis in large single doses of from 15 to 25 c c is advocated by Robinson as a useful method of treatment in certain cases of heart disease provided the tincture is standardized the dosage regulated and the patient is kept under close observation This method of administration not only brings the heart rapidly under the influence of the drug but also affords a more accurate means of studying its effect than the older methods of small repeated doses The use of large single doses is apparently not dangerous under the conditions specified Problems of dosage especially to body weight still need solution The beneficial effect of digitalis in cases with cardiac irregularity caused by auricular fibrillation is especially emphasized by Robinson s experience with large single doses in this condition

Calomel in Ileocolitis —In the medical treatment of ileocolitis Womack gives calomel from 1/24 to 1/48 grain and morphin, from 1/50 to 1/100 grain by mouth every three hour until the bowel quiets down from its continual spasm He believes that ileocolitis is mainly due to a gas producing bacterium that is an attenuated or malignant form of the colon bacillus There is always an attending pyelitis in which the colon bacillus in great numbers is found and this pyelitis may antedate, and certainly is the immediate complication of ileocolitis and assumes the major role from the standpoint of the cause of death Therefore in the treatment of ileocolitis first attention should be paid to the kidney Forced feeding of a selected carbohydrate diet with plenty of water should be given All forms of rectal irrigations or alimentation should strictly be interdicted on the ground that they not only do no good but are distinctly harmful

Removing Ureter Calculus Without Operat
catheter is inserted in o the ureter until it

Two c c of a 2 per cent solution of cocain or procain is slowly injected into the ureter at the site of impaction The ureteral spasm is so relaxed in a few moments that the catheter will usually pass beyond the stone where another injection of the anesthetic is made to further deaden the sensation The kidney pelvis is distended with a physiologic sodium chlorid solution and sterile olive oil is injected as the catheter is being removed In this way the pressure above the stone is increased and assists in expelling it, while the muscular fibers of the ureter are relaxed and the sensation is deadened This technic is repeated every second or third day, increasing the size of the ureteral catheter at each treatment

Severe Angioneurotic Edema R Alderson —p 828
Herpes and Varicella C Wilson —p 828

Vitamin Deficiency Cause of Gastro-Intestinal Disorder—The importance of a study of the "dietetic history" in every case of gastro-intestinal disorder is discussed by McCarrison He claims that experience in Germany during the war has shown that children who are properly fed will be less liable to suffer from intussusception Other gastro-intestinal disorders probably connected in their origin or in their continuance with dietetic deficiency and lack of balance of the food are mucous disease of children, celiac disease, intestinal toxemia, and gastro-intestinal stasis They are readily produced by a diet deficient in vitamins and suitable protein while excessively rich in carbohydrates

Syphilis Insontium.—A case is reported by McWalter which he claims proves that syphilis infection can take place in the eight month of pregnancy

Malignant Pustule—The main points of interest in McCurrich's case are that the patient having contracted anthrax from a shaving brush, knew (*a*) when he cut himself, (*b*) when the painful papule appeared at the site of the cut, (*c*) when the papule became a vesicle It is also noteworthy that on admission to hospital, seven days after the onset of the disease, the patient had received no specific treatment and yet appeared to be well on the road to recovery

Injections of Camphor in Oil—Gorman has given intramuscular injections into the gluteal region of camphor in oil, 5 grains in 15 minims, every four hours without untoward results in a single instance

*Congenital Stenosis of Aorta R O Moon —p 1314
Obstruction Due to Formation of Spur After Finney's Operation R P Rowlands —p 1315

Protein in Nephritis—There does not seem to be any theoretical objection to giving protein or urea in large amounts to parenchymatous cases in which there is no retention of nitrogenous products in the blood In interstitial cases where such retention tends to be more or less well marked, it is generally considered that protein, especially in the form of meat, is on the whole, contraindicated There is, however, no proof whatever, in the opinion of MacLean and Russell that protein acts detrimentally even in advanced interstitial nephritis but, on general principles, it is probably best to limit the intake of protein in patients showing marked retention of nitrogenous products in the blood On the other hand, it seems quite certain that milder cases of interstitial nephritis are not benefited by very strict dietetic limitations As the result of very many observations, the authors are convinced that, in general, patients suffering from interstitial nephritis of moderate severity should be allowed a fairly liberal diet in which protein need not necessarily be cut down to any great extent In very severe cases it is probably best to depend chiefly on carbohydrate food

Significance of Fever in Cancer—The fever of cancer uncomplicated by inflammatory lesion is termed "growth fever" by Gordon on the assumption that the fever is produced by some process of the growth itself apart from inflammation, and the fever caused by any inflammatory complication of a cancer, he terms "complicated fever Gordon classifies cancer according to the type of fever occasionally found in conjunction therewith A. Either growth fever or complication fever liver stomach suprarenals, lung with mediastinum, long bones, breast (rarely) B Complication fever only gallbladder, bile ducts large intestine, small intestine, appendix uterus, fallopian tubes, ear, glands in neck, tongue lip, esophagus, pancreas, peritoneum, rectum, eye larynx, thyroid C Neither form of fever kidney, ovary, vulva, testis, penis, urethra, parotid, jaw, brain, spine, skin, muscles, heart and pericardium

Cerebral Reactions Following Use of Neo-Arsphenamin—The conclusion arrived at by Hitch is that the widespread capillary hemorrhages, demonstrated by microscopic sections, afford a clear anatomic basis for the hypothesis put forward by Dudley that the symptoms are due to anoxemia, that this anoxemic condition is mainly produced by interalveolar hemorrhage into the lungs, and to a less extent by interstitial capillary bleeding into other organs, and that the continuous administration of oxygen offers the best hope of recovery in these unfortunate cases These appearances would also seem to explain in part the rapid development of the symptoms and the comparatively slow recovery, as instanced by Parnell's case resulting from the continuous administration of oxygen

Traumatic Rupture of Heart, Liver and Kidney—A well built man, aged 23 years, sustained a clean unbroken fall of 45 feet, alighting on a wooden plank and some steel plates lying on the ground He was not killed outright, but was dead on his arrival at the hospital twenty minutes later On postmortem examination of the body, preliminary inspection revealed no damage beyond a few scratches and bruising at the right elbow A deliberate examination by inspection and palpation showed no further evidence of bruising laceration, fracture, or dislocation The peritoneal cavity contained about 2½ pints of fluid blood of which the source appeared to be five transverse lacerations of the right lobe of the liver—four on its upper, one on its under surface immediately to the right of the transverse fissure There was a considerable quantity of blood effused into the retroperitoneal tissue There were two transverse tears about half an inch apart on the front of the right kidney near its middle, one through little more than the capsule, and one about ¼ inch in depth through practically the entire width of the kidney No other source of retroperitoneal hemorrhage was found No other abdominal injury was discovered The pericardium was intact and contained about a pint and a half of human blood A slitlike opening into the cavity of the left auricle was found, about 0 25 cm in length and situated exactly in the length of the free edge of the left auricular appendage

Congenital Stenosis of Aorta—The special points of interest in Moon's case are the very few symptoms calling attention to the heart, combined with the pronounced physical signs and the comparatively slight impairment of the patient's general activity The patient was 11 years old He had a congenital stenosis at the level of the aortic valves He was always active and energetic and could always walk a fair distance and even play football without becoming breathless or tired, though he got breathless sooner than other boys In general appearance he was distinctly undersized, very pale but bright and intelligent looking The apex beat was in the fifth space in the nipple line with a somewhat forcible cardiac impulse and the dulness was increased a trifle to the left Over the aortic area there was a very coarse systolic thrill, which was also palpable over the carotid arteries All over the precordial area there was a harsh systolic murmur, having a maximum intensity at the second right interspace where it could be heard several inches from the chest wall Pulse was small in volume, rate 70 In the electrocardiogram the T-wave was inverted in Leads II and III while in Lead III the P-wave was inverted. There was no evidence of left-sided preponderance

Right Mastoid Suppuration Causing Left Sided Facial Paralysis E W Williams—p 1364

Nerve Impulses as Cause of Visceral Disorders—The aim of Gray's study of more than 300 intestinal cases has been to show that there is a large group of visceral disorders primarily initiated by a derangement of normal nerve impulses It is a law of the intestine that increased work is always responded to by increased effort leading to hypertrophy This truth is exemplified clinically in the results of mechanical obstruction in every part of the gastro-intestinal tract, while, physiologically, it has been demonstrated by the work of Bayliss and Starling No such hypertrophy is ever seen in the visceral disorders under discussion, and this fact alone constitutes an a priori refutation of any mechanical origin as applied to the bowel itself The establishment of attenuation and muscular relaxation of the colon so characteristic of this group of disorders is only possible if this physiologic response to an increase of work is prevented, either by primary intramural disease or by prolonged active inhibition of its musculature due to abnormal direct or reflex nerve impulses The role of the mesentery is to carry vessels and nerves to and from the intestine and never to act as a supporting structure, when it so acts (e g, in congenital mobility of the colon) mechanical stimulation of the contained nerves results The truth of this is evidenced experimentally and at operations Gray asserts that it is equally true pathologically

Jaundice After Arsphenamin Injection.—Attention is directed by Hallam to the prevalence of jaundice occurring during the treatment of syphilis with arsenobenzol preparations, and he shows that it is relatively more frequent with some preparations than with others Clinically, the attacks are usually very similar to the ordinary catarrhal jaundice The patient usually recovers in from two to six weeks Cases, however, have been recorded which have commenced as apparently a mild attack but have become progressively worse and terminated as acute yellow atrophy For this reason alone although this occurrence is rare, jaundice developing either before or after treatment of syphilis is of extreme importance Hallam analyzed a series of cases in order to determine what might have caused this complication It occurred relatively more frequently after the use of arsenobenzol preparations (neosalvarsan, neokharsivan novarsenobillon, etc), but the causation is as yet undetermined

Operation for Fistula of Parotid—Curtis describes a seton operation which effected a cure in two cases of fistula

Intestinal Obstruction by Hair Ball—Two cases are reported by Tanner (1) obstruction of the small intestine by a large hair ball and (2) strangulation of the small intestine by the appendix acting as a band He claims that no case like the first is on record

Hair Ball in Ileum Causing Obstruction.—Gibson cites the case of a boy aged 6 years from whose ileum he removed a hair ball which had caused obstruction

*Respiratory Insufficiency of the Apex E Sergent—p 469

Respiratory Insufficiency of the Apex—Sergent refers to a functional hypocapacity of the apex, usually bilateral, and usually associated with malformation of the bony frame of the chest, low index of robusticity, anemia, asthenia and often adenoids Not enough air gets into the apex The region does not share in ample excursions, and the respiratory muscles and diaphragm are weak, the habits of breathing defective, but with careful examination the danger of mistaking this functional hypocapacity for tuberculosis can be avoided Breathing exercises, the spirometer, and restoring the permeability of the nasopharynx will generally restore clinically normal conditions

Febrile Chorea and Epidemic Encephalitis—Harvier and Levaditi think that certain cases of acute febrile chorea are a manifestation of acute epidemic encephalitis, basing this assumption on the histologic findings in a case described in detail and the effects of inoculation of animals with the nerve centers Souques has reported two similar cases, in one the acute chorea merged finally into typical lethargic encephalitis

Treatment of Tuberculosis with Salts of Cerium.—This communication from Grenet and Drouin, relating their success in treating different forms of chronic tuberculous infection, is a logical sequence of the research on cerium and other uncommon metals which Renon, Frouin and others in France have been conducting [for eight years] in tentative chemotherapy of tuberculosis Two facts seem to be established namely that the salts of the cerium earths reduce the fats of the tubercle bacillus in cultures to which these salts have been added, and that these salts induce a mononuclear leukocytosis in man and animals Grenet and Drouin selected the sulphates of samarium neodymium and praseodymium and here report a year's work with the clinical application of these cerium metals They inject by the vein from 2 to 5 c c of a 2 per cent solution for twenty days, then suspension for fifteen or twenty days and then a second and a third series of injections They summarize the details of 8 cases of tuberculous glands, 10 of lupus, 5 of verrucous tuberculous lesions, 8 of erythematous lupus, and 23 of pulmonary tuberculosis The external tuberculous lesions healed and chronic apyretic pulmonary tuberculosis showed considerable improvement if not an actual cure The general health improved the expectoration became less purulent and less profuse, the physical signs became modified and disappeared and the bacilli sometimes disappeared from the sputum or if they were still found in the sputum they showed extremely pronounced modifications and took stains badly Three guinea-pigs inoculated with these modified bacilli, after losing weight for two weeks had regained their health by the end of two months A fourth recently inoculated, shows no signs of disease confirming the great reduction in the virulence of the bacilli Grenet and Drouin add Will the latent and well tolerated lesions flare up again? Time alone will tell but the improvement in all seems to be continuing and the apparent cure has persisted now for several months

The results, such as they are, are very interesting a direct action on the bacillus, an action on the human organism by favoring the production of sclerosis, perhaps on account of the enormous mononuclear leukocytosis induced" In conclusion they reiterate that these cerium salts should be used with pulmonary tuberculosis only in the afebrile cases, stopping at once if fever develops "If these precautions are not observed, discredit may be brought on a method which is still only in the period of being studied, but which already seems to offer real hope"

Salts of Cerium Metals in Chemotherapy of Tuberculosis—Renon reviews his eight years of research on a large number of salts of not commonly used metals, hoping to find some that would reduce the virulence of the tubercle bacilli in the organism while rendering the soil of the organism less favorable for its development The sulphates of some of the cerium metals reduce the fats of the tubercle bacillus from 25 or 40 per cent to 22 or 16 per cent He mentions other salts which induce mononucleosis in man and animals but are too toxic for clinical use, and adds, "The results obtained by Grenet and Drouin with the sulphates of the cerium earths are certainly the most scientific yet realized in the chemotherapy of tuberculosis In controlling their results, their technic must be carefully followed, and the warning heeded that in acute forms of tuberculosis no benefit follows and the lesions may even be aggravated" In the five cases he has just begun to treat, the injections are well tolerated and the leukocytosis has run up from 10,000 to 20 000, 26,000 or 40,000 with from 18 to 23 per cent mononuclears

Sulphates of Cerium Metals in Pulmonary Tuberculosis—Esnault and Brou report their experience with the Grenet and Drouin method in twenty cases, and say that the number of cases of unquestionable improvement is impressive if the gravity of the cases is taken into account, and it permits the highest hopes of progressive improvement to a cure This will be the rule they say, when treatment is applied in the early stage without waiting for advanced pulmonary lesions They add that as the treatment seems to act on the tubercle bacilli alone, it might be advisable to add some medication to act on the secondary infections [Frouin in a communication read before the Paris Academie de medecine, April 6, 1920 reported encouraging results from the application of the salts of earths of the cerium group to torpid suppurating ulcerations He stated that 2 or 4 per cent solutions of these salts and especially of the sulphates of the cerium group promoted healing, hastening the formation of derma and epithelium layers and seemed to have an antiseptic action while less irritating than the nitrates and chlorids L Renon also has been studying since 1912 these salts of cerium metals in the chemotherapy of tuberculosis, and in a communication read at the Academie de medecine, March 4, 1920, he referred to his work and the difficulty of such research, as it requires study of the action of the chemical on cultures of the bacillus study of the toxicity of the chemical for animals, at least for the dog rabbit and guinea-pig, if the toxicity is slight, study of its action on experimental and spontaneous tuberculosis in animals and then in human tuberculosis Chemotherapy he said, might be aided by withholding from the tuberculous those substances such as potassium, magnesium phosphorus, sulphur and iron which seem to be indispensable for the proliferation of bacteria in culture mediums He lists nearly two dozen salts of rare metals which have an inhibiting influence in vitro on the tubercle bacillus, among them he mentions cadmium fluorid and chlorid neodyme sulphate and praseodyme sulphate, lanthane sulphate, and the salts of bismuth, of silver, of gold, of selenium, etc]

Tuberculous Nature of Gastric Ulcer Mongorge—p 429
The Role of the Lamblia in Intestinal Pathology F Deglos—p 434
Compulsory Notification of Tuberculosis Piéry—p 464

Tuberculous Nature of Simple Ulcer of the Stomach—Mongorge argues that simple ulcer is of toxi-infectious

origin, and as tuberculosis is the toxi-infectious disease *par excellence* and as Jaksch and Brinton assert that 25 per cent of patients with simple gastric ulcer die of pulmonary tuberculosis, the conclusion seems evident that round ulcer is often of tuberculous origin He summarizes ten personal cases in which the round ulcer developed in a tuberculous patient, or pulmonary tuberculosis developed in persons with gastric ulcer In another case hemoptysis from pulmonary tuberculosis seesawed with hematemesis from a gastric ulcer In one case there was a sequence of round gastric ulcer at 30 pulmonary tuberculosis at 36 and lupus at 45 All were cured in turn, and the woman, now 50, is in good health

June 10 1920 **129**, No 11

*Familial Diseases J Audry —p 469

Familial Diseases and Malformations—Audry reviews the literature on this subject, citing among others Sanger Brown's case with cerebellar heredo-ataxia in five generations, with 25 cases among the 55 members Audry himself has encountered a family with 15 cases of hemorrhagic telangiectasia in four generations Truc was able to trace hemeralopia through ten generations in the Nougaret family, 137 having had night blindness among the 2 137 members Certain regions seem to predispose to hemophilia, such as southern Germany and Switzerland The Gintrac district statistics include 48 German, 9 Swiss and 8 French families with hemophilia The czarevitch was a hemophiliac as also the sons of Henry of Prussia and their mother, who is the sister of the former Emperor Wilhelm Among the instances of familial malformations cited, Audry mentions the nevi found in the Drieux family from the fifteenth century to date Baroux found records of the nevi in 41 female members of the family and all at the same points, places where the armor exerted pressure in the early days of the family The village of Yzeaux, in Audry's own region is noted for the six fingers and toes of the inhabitants Potton in 1829 and 1836 published an account of this community malformation, the records showing that in the eighteenth century nearly all the inhabitants were *sexdigiti* Devaix confirmed this in 1862, but Benard has recently reported that the anomaly is dying out, only three families with polydactylia being discovered there now It seems to be the rule that with familial malformations and diseases of a continuous heredity type if the subject is sound, no restrictions need be imposed on marriage, and the same applies to the male descendants in families with familial disease transmitted by the mother Familial diseases of the fraternal or recessive type such as deafmutism and pigmented retinitis are less inclined to reappear than the others mentioned above but consanguineous marriages no matter how remote the connection, are sometimes highly dangerous

May 22 1920 **10** No 21

*General Paresis in Tuberculosis S Roque and V Cordier —p 417
Pilomotor Reflex with Paresthetic Meralgia Andre Thomas —p 422
*Acute Pulmonary Edema and Blood Pressure L A Amblard —p 425

General Paresis in Tuberculosis—Roque and Cordier describe a case of apparently typical paretic dementia in a man of 50 with pronounced tuberculosis of long standing and syphilis acquired thirty-four months before death Necropsy revealed tuberculous meningitis and old tuberculous lesions in the cortex They do not venture to decide whether the case is one of general paresis masquerading as an ordinary lesion or whether the tuberculous leptomeningitis realized the syndrome of syphilitic general paresis

Acute Pulmonary Edema—Amblard states that, in his experience, the persons who developed acute edema of the lungs always had a history of hemoptysis at some time or blood streaked sputum possibly ascribed mistakenly to tuberculosis, or after trauma In two cases in which the pulmonary edema developed under his eyes he noted that the high blood pressure ran up still higher, both the minimal and maximal pressure showing a rise of several degrees Then suddenly the pressure dropped, the maximal from 280 to 140 mm mercury for example, the minimal from 180 to 100 while the pulse ran up from 70 to 130 Venesection tided through the period of dyspnea but the heart was still unequal to its task and the blood pressure never returned to its former figure Although the latter was abnormally high yet this was necessary to ensure adequate circulation even although this was still below normal Each attack reduces it still lower The onset in each is sudden but each is always preceded by the giving way of the ventricle, then the blood pressure drops and this in turn is followed by the acute edema in the lungs but the heart action keeps up and there is no arrhythmia The cause of the sudden weakening of the ventricle is still a mystery, he says, but much can be accomplished in treatment with drugs to combat it and dieting to relieve the kidneys of all unnecessary work The prompt benefit from venesection cannot be from reduction of the blood pressure as this is not accomplished by clinical venesection, nor from escape of toxins, as this is likewise insignificant and the effect would be more gradual nor from modification of the composition of the blood, as this could not occur so promptly

Presse Medicale, Paris

June 2 1920 **28** No 36

*Urobilinuria M Labbe and P A Carrie —p 353

Urobilinuria—Labbe and Carrie reaffirm that urobilinuria is evidence of functional insufficiency of the liver The bile pigments entering the bowel become transformed into urobilin Part of this is voided in the stools (stercobilin) but the rest is reabsorbed and carried to the liver The liver utilizes it anew probably to make bilirubin, but if the liver is not functioning properly, some of the urobilin passes through it unmodified and gets into the blood and passes from the blood into the urine Urobilinuria thus requires (1) the presence of stercobilin in the intestines which implies the permeability of the biliary passages and (2) functional insufficiency of the liver There can be no urobilinuria at the height of jaundice from retention In a recent case a man with chronic jaundice from obstruction of the bile ducts by a lesion in the pancreas had no urobilinuria not even after the liver functioning had been relieved by fastening the gallbladder to the skin so that bile production and evacuation proceeded practically normally except for the participation of the intestines A second operation joined the gallbladder to the small intestine the only change from the previous condition was that the bile entered the bowel instead of being voided through the fistula and urobilin promptly appeared in the urine anew Of course bilirubin may become transformed into urobilin elsewhere than in the bowel but this is exceptional and comparatively insignificant Fischler's dogs with a bile fistula had no urobilinuria unless they were allowed to lick the bile from the fistula or were given bile by the mouth or were injected by the vein with distilled water the latter confirming the possible hematic origin although under conditions scarcely realizable in the clinic

*The Minimal Blood Pressure with Hemorrhage P Balard —p 154
Retention of Urine from Genital Tumor G Devierre —p 161
*Fatal Embolism in Course of Pregnancy S Remy —p 172

Spinal Anesthesia for Gynecologic and Obstetric Operations—Delmas expatiates on the superior advantages of spinal analgesia for these interventions and especially when done with cocainized spinal fluid an ampule of 0 02 gm cocain being dissolved in the spinal fluid for a fifteen minute operation

The Minimal Blood Pressure with Hemorrhage—Balard refers in particular to severe puerperal hemorrhages saying that the maximal arterial pressure gives no indication of the actual decline of the blood pressure in these cases In four cases described in detail the minimal pressure of 5 was the extreme limit, these patients dying while all recovered with

a minimal pressure of 7, although the clinical picture seemed identical in all

Embolism Early in Pregnancy—Remy reports a case in which the mild phlebitis of the internal saphenous vein entailed sudden and fatal embolism, it happened to occur during the physician's casual call to inspect the phlebitis The woman was lying quietly in bed at the time In Lancereaux' case the embolism occurred with phlegmasia of both legs, the patient recovering In three other cases the embolism was fatal, although the phlebitis was insignificant Possibly citric acid might ward off embolism

*Scurvy in Children U Franchetti—p 193
Should Foundlings Asylums Be Abolished? R Fusi—p 211
*Progressive Lenticular Degeneration A F Canelli—p 232

Scurvy in Children—Franchetti reports a case in which the retrospective diagnosis was chronic scurvy without any acute phase Before the age of 3 there probably was an unsuspected stomatitis which interfered with normal eating so the child refused to eat anything but boiled milk and coffee At 3, and again at other periods later there was painful paraplegia, sometimes with stomatitis maintaining the vicious circle Neuritis was diagnosed, and although the physician ordered a change of diet this was not enforced At 5 the roentgenograms showed extreme dystrophy of the bones in and near the knees and the painful paraplegia, cachexia and anemia were severe with absolute anorexia, but there never had been any tendency to hemorrhages

Progressive Lenticular Degeneration—Canelli analyzes what has been published on this disease since Wilson's description of it in 1912 Higier has reported on a family in which the father at 30 developed paralysis agitans and one child has this Wilson's disease and another the Westphal-Strümpell pseudosclerosis In Schutte's case the clinical course suggested the former, the necropsy findings the latter

Absorption of Solid Particles in the Peritoneum.—Dutrey's research has confirmed that the lymphatics, omentum and diaphragm take up and retain for a time at least the solid particles injected into the peritoneal cavity The blood vessels do not seem to share in this task, none of the particles of India ink injected having ever been refound in the blood vessels There do not seem to be any direct routes of connection between the peritoneal cavity and the spleen, liver and kidneys The few leukocytes containing any of the particles which were found in these organs had evidently found their way to them by way of the lymphatics and thoracic duct

Papillomas in Child Larynx—Quadri has had one case in which multiple papillomas in the larynx retrogressed so that the child now 11 has no further inconvenience or danger from the tumors, he first saw the papillomas at the age of 2 Another girl required tracheotomy on account of a second recurrence after operation The one small tumor left was coughed up later He thinks that probably many cases of papilloma escape detection and the tumors retrogress later His practice is to remove the tumors even in emergency cases, thus avoiding tracheotomy unless absolutely compelled, supplementing the surgical measures with arsenic internally He advocates radium treatment after tracheotomy but warns that without this it is liable to induce suffocation from the congestion it induces and thus compel an emergency tracheotomy, as occurred in one of his cases

Dermatologic Hints for the Practitioner M Joseph —p 101

Silver Arsphenamin in Treatment of Syphilis—Hahn has been using silver arsphenamin for two years and now reports the results, after treating 300 syphilitics and giving nearly 4 000 intravenous injections He endeavors to justify his standpoint that syphilis early diagnosed should be treated energetically and with large doses of arsphenamin, even though there may be some risk involved He regards silver arsphenamin as the best form of arsphenamin, saying that in its action it is much superior to arsphenamin sodium and neo-arsphenamin, and is at least equal if not superior to arsphenamin (old salvarsan) He adds that silver arsphenamin is to be put on the market soon He used no mercury or other medication in connection with the silver arsphenamin treatment, though he admits that possibly better results might be secured with a combination of silver arsphenamin and mercury On account of the dark brown color and the lesser solubility, silver arsphenamin is more difficult to inject than arsphenamin sodium and neo-arsphenamin Injections improperly given are painful He gives ordinarily 0 1 gm as an initial dose for both men and women and has seen no pronounced bad effects He uses a 1 to 1 5 per cent. solution Twelve injections of 0 25 gm each given twice a week (3 gm in all) constitute a vigorous course of treatment

Blocking of the Splanchnic Nerves for Operations on the Upper Abdomen—Buhre describes the Braun method of blocking the splanchnic nerves for operations on the upper abdomen, after the abdomen has been opened by a median incision He has used the method in 104 cases and found the technic remarkably simple The anesthetic effect is prompt and lasts from one and a half to two hours, and no danger for the patient is involved He therefore recommends it as the method of choice in all operations on the upper abdomen, especially gallstone operations

Serotherapy of Tetanus by Multiple Routes—Eberle reports three cases of tetanus in which on the fifth to the seventh day after the appearance of the first symptoms he treated the patients with intracranial, subdural and intraspinal antitoxin injections, according to the Betz-Duhamel technic No improvement followed and the three cases resulted fatally H Smidt has also reported eight cases of tetanus which were treated by the same multiple routes the serotherapy being begun in from six to twenty-four hours after the first symptoms became manifest but all these patients died likewise Eberle expresses the wish that all who have had experience with this direct method of serotherapy might report their results Betz and Duhamel reported three recoveries in four severe cases and others similar experiences so that there was a record of eight recoveries in ten severe cases of tetanus, until the Eberle and Smidt series of eleven fatal cases

Laryngeal Perichondritis Simulating Thyroiditis.—Bruggemann reports a case of acute laryngeal perichondritis, in which edematous swellings appeared on the outside of the throat simulating the picture of acute thyroiditis Sensitiveness to pressure was however, confined to the larynx which ruled out thyroiditis Pressure symptoms elicited in the thyroid were doubtless due to the fact that in pressing on the thyroid a certain amount of pressure is brought to bear on the larynx

Nitrobenzene Poisoning Following Use of Delousing Remedy—Wolpe reports two cases of nitrobenzene poisoning in two children of 10 and 12 Their mothers had used on their heads a delousing remedy containing nitrobenzene The writer demands that druggists be restrained from dispensing nitrobenzene unless the buyer holds a special permit, and that the use of nitrobenzene in delousing remedies and in cosmetics in general be prohibited by law

Prophylaxis of Venereal Diseases I Jensen —p 100

Nonspecific Promotion of the Functional Capacity—Weichardt approves the term "activation of protoplasm" to express the peculiar promotion of the functional capacity of the entire system by various means, such as by exercise by getting rid of fatigue products, by vaccination but most strikingly perhaps by protein therapy parenteral injections These whip up the organism to increased functional achievement a nonspecific *Leistungssteigerung* The effect is not that the function is altered it is merely intensified The response varies in the normal and in the diseased, and in normal regions and in pathologic processes He reviews the recent literature on the subject citing in particular experiments with preliminary intensive radiation inunction of mercury or sweating procedures etc, to enhance the effect of the protein therapy

Water in Ampules for Intravenous Injections.—Dreyfus finds it a very convenient and safe method for arsphenamin injections to use distilled water that has been put up in sealed ampules Thus stored distilled water may be kept for years unimpaired but the ampules must be made of very hard glass that will give off little or no alkali

Osteomalacia in Munich—Heyer reports nine cases of osteomalacia traceable to the restricted war diet which while they presented in the main the usual symptoms showed also certain peculiar manifestations

Eosinophilia in Muscular Rheumatism.—Synwoldt found marked eosinophilia (up to 18 and 22 per cent of eosinophils) in 79 per cent of thirty cases of acute muscular rheumatism She thinks this has diagnostic importance

Grave Hemorrhage of the Lung Following Diagnostic Puncture—Flesch-Thebesius reports a case in which surgical puncture of the lung in a youth of 15 caused a hemorrhage

into an empyema cavity, which was not discovered at once and thus threatened the life of the patient

*Febrile Abortion. A. Heyn.—p. 65
*Multiple Sclerosis. G. Steiner.—p. 68
*Rumination in Infants. A. Ylppo.—p. 76

Febrile Abortion.—Heyn reports from the Charité at Berlin a mortality of only 2.4 per cent. of the 410 cases of febrile abortion treated by active intervention, out of the total 578 febrile abortions. Almost 85 per cent. had return of normal temperature the same or the next day, 3.4 per cent. had fever for more than six days. After the middle of the fourth month instruments are never used to clear out the uterus. Cautious and skilful dilatation of the cervix with laminaria first, for twenty-four hours, is the main thing.

Multiple Sclerosis.—Steiner has succeeded in inducing a paralytic disease in rabbits and guinea-pigs by inoculating them with fluid and blood from recent cases of multiple sclerosis, and a spirochete was found in their tissues. A monkey inoculated at the same time developed paralysis eighteen months later, and the brain showed changes analogous in almost every respect to those found in multiple sclerosis in man. Stemerling has also beheld living spirochetes in the brain two hours after death from multiple sclerosis. These facts justify tentative treatment with spirocheticidal drugs, Steiner asserts, but the results to date have been conflicting.

Rumination in Infants.—Ylppo has found that infants are not so likely to swallow air when they are fed lying prone, the head raised or turned on the side. The change to reclining on the abdomen is sometimes enough to break up a rebellious habit of rumination. If not, he has the child lie on a flat hammock, stretched from headboard to footboard of the crib. The unsteadiness the movements of the hammock supplement the change to the prone position so that the child's attention is diverted, and it forgets its ruminating habit.

*General Principles of Organotherapy. L. Borchardt.—p. 97
Treatment of Mental Disease. Raecke.—p. 101. To be continued
*Dangers from Removing Bullet in Tissues. H. Curschmann.—p. 108
*Splenectomy in Pernicious Anemia. W. Charlton.—p. 111

The Principles of Organotherapy.—Borchardt recalls that some of the active substances isolated from certain organs display an action which has nothing to do with the original function of the organ and warns that we must not overestimate the reciprocal or antagonistic action between different organ extracts. He cites as important Langley and Elliot's assertion that epinephrin in all its actions on any organ behaves the same as electric stimulation of the afferent sympathetic fibers of that organ. Suprarenal and certain other extracts seem to activate the protoplasm and thus increase the functional capacity like parenteral protein therapy. If the organ extracts contain any protein, there is a superposed protein therapy effect. Both suprarenal and pituitary extract increase the immune reactions. In typhoid the former has increased the agglutinins from 1:20 to 1:5,120 or even 1:10,240 and pituitary up to 1:2,560. There is much to sustain the assumption that the hemostatic action of organ preparations is due to this promoting of the functional capacity. This is probably also the explanation of the benefit from transfusion of blood. The blood is destroyed, and at most its elements are used in the production of new blood. The promptly favorable effect is probably merely from stimulation of the functional capacity of the blood-producing system. Bone marrow and spleen extract may yield as favorable results in the line of regeneration of the blood as transfusion of blood itself. Pituitary treatment of typhoid, tuberculosis, cholera, etc., has been tried on this theoretical function-promoting basis, and with promising results in some circumstances. We have thus at our command a substituting hormone therapy, as in thyroid treatment of myxedema, a symptomatic hormone therapy, as in thyroid treatment of obesity, a ferment therapy, as in supplying the finished pepsin or a hormone which stimulates some special secretion, a hormone therapy seeking to utilize the reciprocal and antagonistic action of the endocrine glands, and, finally, we have the protoplasma activation therapy as in parenteral protein therapy. Hitherto, he adds, the application of these principles has been mostly empiric.

Danger of Extracting Bullet.—Curschmann reports a case of lead nephritis developing fifteen months after a bullet had entered the hip joint. The bullet was then removed but lead encephalitis followed the operation the second day, with fatal convulsions. He ascribes this to the particles of lead which had been absorbed into the tissues around, and had become mobilized by the operation when they had been in a way encapsulated before. The immediate increase in basophil granular erythrocytes in the blood testified to the intense aggravation of the lead poisoning. How to prevent this is a question. Leaving the wound open and promoting in every way the outward flow of lead-containing secretions will help. It is possible that by local infiltration of the tissues with some chemical the lead might become transformed into an insoluble compound. Straub has suggested infiltration of the field of operation with sodium sulphate or the bicarbonate which might have the effect of sweeping the lead albuminate in the region into the kidneys, and thus get it eliminated before it had a chance to reach the central nervous system. This is analogous to the action of potassium iodid. Experimental research with a deposit of lead in the tissues has confirmed the acceleration of the resorption and elimination of the lead under internal treatment with potassium iodid. No chemical is known yet which will transform and hold the lead at the spot but search should be made for such.

Splenectomy in Pernicious Anemia.—In Charlton's case the pernicious anemia retrogressed after splenectomy on the woman of 32, but her pulmonary tuberculosis did not seem to be modified by the improvement in the blood picture.

Conclusion
Concrete As a Conductor of Electricity. S. Jellinek.—p. 364

Treatment of Scabies.—Oppenheim reports that in the treatment of over 20,000 recent cases of scabies in the Wilhelmine Hospital his modification of the Hardy treatment effected an entirely harmless and absolutely certain cure. The whole treatment is completed within a period of three hours as compared with a week or more by older methods. He describes the method in detail and recommends that stations for the purpose be organized throughout the country.

Treatment of Gonorrhea by Hot Baths.—Kapferer found the Weisz method of treatment very weakening to the patients some of whom were obliged to discontinue it. The results are very uncertain, and it requires the constant presence of physician and nurse. The aim is to kill the gonococci by heating the body to 40 C. (104 F.) or more and keep it at this point. The temperature of the deep bath is raised within fifteen minutes from 38 to 43 or even to 45 or 46 C. (114.8 F.)

*Conservative Operation in Chronic Pyosalpinx F R Brewitt—p 462
Injury of Sigmoid Flexure in Induced Abortion Schluter—p 464

Kidney Disease in Relation to Pregnancy—Heynemann explains that while a typical pregnancy glomerular nephrosis is not likely to develop into chronic nephritis yet an acute exacerbation during a pregnancy, of a previously existing glomerular nephritis may become chronic In ordinary cases of pregnancy glomerular nephrosis so long as there is no tendency to eclampsia interruption of the pregnancy will very rarely be indicated but with acute and chronic glomerular nephritis interruption of the pregnancy must always be considered In acute glomerular nephritis, if the blood content of the urine increases in spite of treatment or if it keeps at a high level, interruption of the pregnancy is imperative

Conservative Operation in Chronic Pyosalpinx—In the treatment of pyosalpinx Brewitt has used turpentine injections in twelve cases and reports remarkable success After a Pfannenstiel incision the patient is placed in the Trendelenburg position The intestines are walled off to expose the pelvis and with a large cannula the tubal sacs are punctured and the pus or serous fluid is aspirated The cannula is left in the opening and a 10 per cent solution of oil of turpentine (slightly less than the amount of fluid aspirated) is injected The site of puncture is sutured with fine catgut Then 4 or 5 c c of the solution are carefully injected into the passage of the tube from each end to block the infection from spreading If any loops of the small intestine or the sigmoid are adherent to the pelvic organs the adhesions are broken up Then the omentum is brought down and is spread out like a mantle so that it extends deep down into the Douglas pouch, and is sutured to the posterior pelvic wall thus completely roofing over the pelvis There was no postoperative fever, and prompt recovery followed After-treatment consisted of warm sitz baths In ten of the twelve cases so treated gonorrheal infection was present

*Porphyrinuria with Colics I Snapper—p 1233
Excentric Fixation for Strabismus G ten Doesschate—p 1250
Danish State Sickness Insurance H H van Eyk—p 1256
Case of Lethargic Encephalitis C D Cramer—p 1266
Abscess in Left Brain with Right Otitis Media Klessens—p 1269

Porphyrinuria with Colics—Snapper describes three cases of porphyrinuria accompanied with abdominal pains at the times when the excretion of porphyrin was most pronounced The patients were a girl of 17, a woman of 24 and a man of 33 In each case in time the inevitable paralysis developed, of both the cerebral and spinal type and proved speedily fatal Necropsy failed to reveal any characteristic changes A tuberculous apical process and congenital malformation of one kidney in the young girl seemed to be incidental Between attacks of colic the patients felt entirely well until the terminal paralysis The pains and the abnormal functioning of the liver cells responsible for the porphyrin production and also the hemorrhagic erosions in the stomach responsible for the occult hemorrhages might be explained by a pathologic condition of the retroperitoneal plexus spreading finally to involve the whole peripheral nervous system Chronic lead poisoning can produce a similar picture with porphyrinuria colics and recurring gastric ulcer, and endogenous intoxication might be considered Attempts to induce similar symptoms in rabbits with sulphonal poisoning were only partially successful A normal tint of the urine does not exclude porphyrinuria, as a tuberculous alcoholic aged 29, presented a strongly positive porphyrin spectrum though the urine was but slightly darker At necropsy the tuberculous process was found to be close to spleen stomach and liver, thus possibly affecting the retroperitoneal plexus, which supports Snapper's theory stated above

Duration of Systole in Electrocardiogram L S Fridericia—p 469 In German

Fat Content of Blood and Liver in Diabetic Coma—Geelmuyden tabulates the necropsy findings in ten diabetics and in four nondiabetics in regard to the weight of the liver and its content in glycogen and fat and the fat content of the blood They confirm the old assumption that the glycogen content of the liver may be high in diabetics The amounts ranged from traces up to 44 7 per cent in the cases with the highest acidosis This is a larger proportion than is found in the liver of dogs with pancreas and phlorizin-starvation diabetes The fat content does not parallel the glycogen content as a rule but the livers with high percentage of glycogen had also large proportions of fat On the other hand the blood showed a much higher proportion of fat than is found in experimental diabetes In the latter the liver contains much fat and little glycogen while the reverse prevails in human diabetes He ascribes this to the more gradual onset of the human diabetes (In German)

Lethargic Encephalitis F Harbitz —p 529
*Spontaneous Subarachnoid Hemorrhage J Blom —p 551
*Labor Induced with Internal Measures G Benestad —p 563
*Primary Sarcoma of Lung K Wildhagen —p 567
Aneurysm of Main Trunk of Pulmonary Artery K Wildhagen —p 572
*Migration of Fat H C Geelmuyden —p 578

Spontaneous Subarachnoid Hemorrhage—In one of Blom's two cases the sudden onset of weakness the knees giving way, the intense headache chills and vomiting Kernig sign, bradycardia and stiff neck were explained by the blood in the lumbar puncture fluid Great relief followed the punctures, but no micro-organisms could be found in the fluid One case was mistaken for lethargic encephalitis the other for epidemic meningitis Both the meningitic and the comatous form can terminate in recovery or progress to a fatal ending In a recent compilation of thirty-one cases all ages are represented from a hemophiliac boy of 7 to five subjects between 60 and 80 Petren advises against lumbar puncture, as this might bring on the hemorrhage anew, but Blom comments on its brilliant success as a palliative Petren enforces complete physical and mental repose with ice to the spine

Medical Internal Measures to Induce Delivery—Benestad reaffirms that dietetic measures, plus quinin and pituitary treatment or other internal measures may induce expulsion of the contents of the uterus if the pregnancy is at term or beyond, but not in the course of a normal pregnancy In a case reported in an elderly primipara the fetus had died at the twenty-ninth week, and three weeks later, under castor oil quinin and enemas, labor was induced, although there was no indication of it to start with

Production of Sugar from Fat—Geelmuyden presents evidence to show the connection between the lack of glycogen in the liver and the syndrome migration of fat and ketonuria The latter seems to be a sign that the glycogen content of the liver is very low Only diabetes mellitus in man seems to be an exception to this rule probably because in the course of time the organism adapts itself to the altered metabolism, the ability of the liver to produce sugar from fat increasing as its ability to retain glycogen diminishes The lack of glycogen in the liver starts the migration of fat in order to supply fat for the liver to transform into sugar The assumption that the hyperglycemia and the glycosuria in diabetes are due to an overproduction of sugar from albumin and fat offers a plausible explanation for all the phenomena in diabetes This assumption is much more plausible and instructive than the opposite theory, namely, that diabetes is the result of a lesser combustion of sugar in the organism as the cause of the glycosuria The primary cause of the overproduction of sugar may perhaps be sought, not in the metabolism as such but in the nervous system or the endocrine system Geelmuyden s long article discusses both sides of the question, especially the light thrown on it by the findings in phosphorus poisoning in which there is migration of fat and ketonuria, but the glycogen disappears rapidly from the liver and the sugar from the blood With tardy chloroform fatalities there is fatty degeneration of organs, and with chloroform anesthesia there may be glycosuria and ketonuria and this ketonuria like that in pregnancy and in phosphorus poisoning is independent of the intake of carbohydrates

Ugeskrift for Læger, Copenhagen

May 27 1920 82, No 22

*Otogenous Multiple Intracranial Disease H Mygind —p 687 Concluded in No 23 p 720
*Sun Glasses H Larsen —p 700

Otogenous Intracranial Diseases—Mygind analyzes 207 cases at the ear and throat clinic, including 35 per cent in which there were multiple intracranial complications This material is studied from various standpoints, and also the indications for operative measures The aim should be, he says, to enter the skull along the track of the infection or the most likely path He insists on the necessity in every case of opening up the perpendicular part of the sigmoid sinus to examine it thoroughly throughout This sinus is involved far more often than would be supposed from the symptoms while this form of craniotomy is comparatively harmless In fact he reiterates every craniotomy that leaves the dura intact is harmless Abnormal conditions in the temporal bone and vessels favor transmission of the infectious process This explains the sudden and unexpected development of intracranial processes in the absence of retention of pus or other conditions usually responsible for the spread of infectious processes The intracranial complication is a consequence which our prophylactic measures—operative or otherwise—may not be able to avert, owing to individual anatomic conditions

Sun Glasses—Larsen reports the results of extensive research on different kinds of glass to determine which is the most effectual in keeping out the short-waved chemical rays that induce conjunctivitis etc while interfering least with vision His decision is for yellow glass No 23 (Nitsche and Gunther scale) This absorbs 25 per cent of the 580 wave rays 50 per cent of the 520 rays and 85 per cent of the 460 rays This yellow tint is comfortable for the eyes and impedes vision very little He adds that the macula is protected with yellow pigment in the retina, another physiologic argument in favor of yellow glass

June 3 1920 82 No 23

*Differential Leukocyte Count E Meulengracht —p 715
*Blood Platelet Count H C Gram —p 718
*Determination of Coagulation Time H C Gram —p 720

Differential Leukocyte Count.—Meulengracht describes the physical and other reasons on which he bases his advice to use a cover glass instead of a slide in making the count of the leukocytes

Blood Platelet Count.—Gram has modified the Thomsen method in a way to bring this reliable technic for enumeration of the platelets within the reach of every practitioner A 3 per cent solution of sodium citrate is poured in a Sahli glass to the mark 10, and then with a not too narrow, curved needle venous blood is run down into the citrate solution to the 100 mark After shaking and setting aside for an hour, a small quantity of the citrated plasma is drawn off with an ordinary leukocyte pipet and diluted in the proportion of 1 20 with physiologic sodium chlorid solution and a few drops liquor formaldehydi per 100 c c Counting the platelets in five large squares in the Thoma Zeiss counting chamber after waiting half an hour, gives the number of thousands of platelets per cubic millimeter of the citrated plasma The number of platelets in the blood can be computed from this figure by multiplying with one of the constants in a short table which he gives The constants range from 0 59 with 110 hemoglobin percentage, to 0 63 with 100, 0 68 with 90, 0 73 with 80 0 78 with 70, 0 82 with 60, 0 87 with 50, 0 92 with 40 0 97 with 30, and 1 01 with 20 to 1 04 with 15 per cent hemoglobin He refers to his recent article in the *Archives of Internal Medicine* March, 1920 which explains the importance of the platelet count in the diagnosis and prognosis of various diseases

Coagulation Time with Citrated Plasma—Gram describes his modification of Howell's method, and adds that it will be given with fuller details in an article soon to appear in the Johns Hopkins Hospital *Bulletin*

SURGERY OF CANCER OF THE LARGE INTESTINE *

ARTHUR DEAN BEVAN, M D
CHICAGO

During the last twenty years a great deal of work has been done in the treatment of carcinoma of the large intestine Many men have attacked this problem, and a great many different operative plans have been introduced and tried out I have been much interested in the problem during this period and have run the gamut of the various plans that have been presented From our experience I think we have been able gradually to crystallize some general principles that are essential in the handling of these cases, and I shall briefly and informally present the conclusions I have arrived at as a result of the work I have done in my own clinic

DIAGNOSIS

Before considering the surgical therapy, I would like to make a short statement in regard to the diagnosis of carcinoma of the colon, simply emphasizing the great importance of careful roentgen-ray study of these cases The roentgen ray is not infallible in the diagnosis of cancer of the colon, but it has been developed to a point at which it is certainly the most valuable single piece of evidence that we can obtain in these cases I would not belittle the great value of a carefully obtained clinical history and physical examination of the patient, because these are essential, and are often the basis of determination, but in the absence of a palpable tumor the roentgen ray is absolutely essential to determine by the presence of a filling defect the location of the neoplasm, and it is of great importance in the subsequent management of the case, in determining the shape and location of the abdominal incision In the overwhelming majority of the cases careful roentgen-ray examination, fluoroscopic and plate, gives definite and absolute evidence of the existence and location of the carcinoma of the colon I find, however, that there are some exceptions to the rule In some cases of carcinoma, at the hepatic and splenic flexures the overlapping of the shadows of the barium in the bowel make it impossible in the plate to see any filling defect, and even in fluoroscopic examination it may be difficult to demonstrate any abnormality Cases of this kind, however, are certainly the exception and not the rule In the presence of obstructive symptoms it is frequently not desirable or possible to obtain a roentgen-ray examination before operative interference is undertaken, and here, of course the diagnosis must be based on the history and clinical picture

SURGICAL THERAPY

As my experience has grown in these cases, I have been convinced of the great value of preliminary colostomy in the presence of obstruction In the absence of definite evidence as to the location of the obstruction and in cases that come to us greatly distended, we have adopted the general plan of making an oblique muscle-splitting incision on the right side and either a colostomy using the cecum, or if the cecum itself is involved, an ileostomy, to relieve temporarily the obstruction The plan that we have adopted is a very simple one and the operation is usually done under local anesthesia (Fig 1), a muscle-splitting incision, such as that employed in an appendix operation, the pulling into view of the cecum or ascending colon or ileum, passing a single suture through the skin and superficial fascia, muscles of the abdomen, and peritoneum using a noncutting needle, then transfixing the mesentery of the bowel close to the bowel itself, then bringing the suture out through the opposite side of the incision and fastening the two ends of the suture to a large sized bone or porcelain button, about an inch in diameter, then closing the balance of the skin incision with black silk suture and making no effort whatever at suturing the peritoneum to the bowel, and covering the entire field with a thick, sterile zinc oxid paste We then introduce into the proximal loop through a small puncture a No 12 or 14 American scale catheter, which is held in position by two purse-string sutures of Pagenstecher linen This we regard as a point in the technic of great service, as it secures at once a relief of the gas tension, making the patient much more comfortable If the small catheter becomes obstructed, it is readily washed out with a little physiologic sodium chlorid solution or sterile olive oil The colostomy is completed at the end of about three days by taking an electric cautery and enlarging the puncture opening, which has been used to introduce the catheter, to the desired extent, usually about one-half or three-fourths inch

Too great emphasis cannot be put on the life-saving value of colostomy or ileostomy in the presence of obstructive symptoms in these cases of carcinoma of the colon After the obstructive symptoms have been relieved by the preliminary colostomy, or in the cases of cancer of the colon in which no obstructive symptoms have as yet developed it is essential for us by roentgen-ray examination to determine the presence of the cancer, if one exists and to determine its exact location

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

THREE BASIC PRINCIPLES

In the technic of removing carcinoma I have learned from experience the importance of three basic principles

1 All of these cases can be best handled through four different incisions, namely, a muscle-splitting

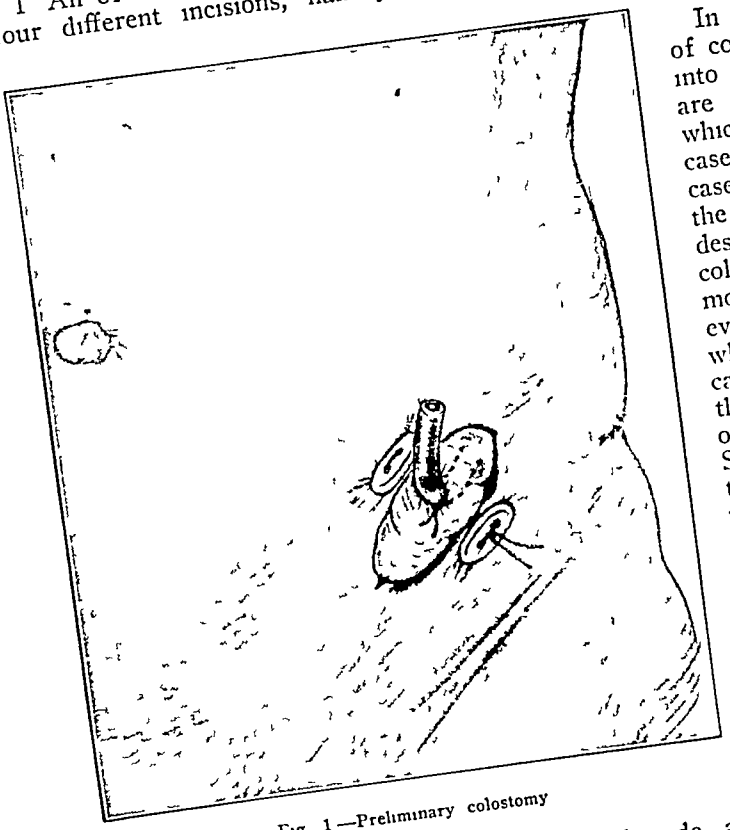

Fig 1—Preliminary colostomy

incision like an appendix incision on the right side, a similar one on the left, a large S-shaped incision on the right side, and a similar one on the left (Fig 2) We now seldom use the midline incision, although in carcinoma of the transverse colon close to the center of that section of the bowel, a midline incision above the umbilicus is, of course, indicated

2 It is essential in the removal of any portion of the large intestine from the cecum to the rectosigmoid to mobilize very fully that section of the bowel which is involved in the process and in the operative procedure For instance, it is possible by dividing the outer layer of the mesocolon from the cecum to the rectosigmoid to mobilize the entire large bowel and bring it out of the abdominal incision In the practical application of this principle to a given case it is necessary, of course, simply to mobilize the bowel for a sufficient length to enable us to resect the cancer and to secure a good anastomosis without any tension (Fig 3)

3 The third basic principle which we have learned to recognize is the importance of a side-to-side anastomosis in big bowel surgery We are thoroughly converted to the view that, after mobilizing the colon widely and resecting the carcinoma, doing this, of course, with a large margin of safety as far as the extent of the excision is concerned, the proper technic is to close both ends of the intestine by crushing, ligating and invaginating with Pagenstecher linen, and then making a side-to-side anastomosis as we do in gastro-enterostomy (Fig 4) The mortality, as I obtain the evidence from my own clinic and from the literature, is about one-half as great in properly performed side-to-side anastomoses as in properly performed end-to-end anastomoses of the large bowel, and because of that fact end-to-end anastomoses should be practically discarded

TWO GROUPS OF CASES

In the practical handling of these cases we should, of course, divide these cancers of the large intestine into two distinct groups first, those in which there are no obstructive symptoms, and second, those in which obstructive symptoms already exist In those cases in which there are no obstructive symptoms, the case can be cleaned up in one operation by following the general principles of technic which I have just described in carcinoma of the cecum or ascending colon, an oblique incision on the right side, with free mobilization of the colon up to the hepatic flexure, or even including the hepatic flexure if this is necessary, which is quite possible by our muscle-splitting incision carried well backward in the flank In carcinoma of the hepatic flexure or upper part of the ascending colon or right portion of the transverse colon we employ our S-shaped incision on the right side, in carcinoma of the central portion of the transverse colon, a midline incision above the umbilicus, in carcinoma of the splenic flexure or in mobilization of the splenic flexure,

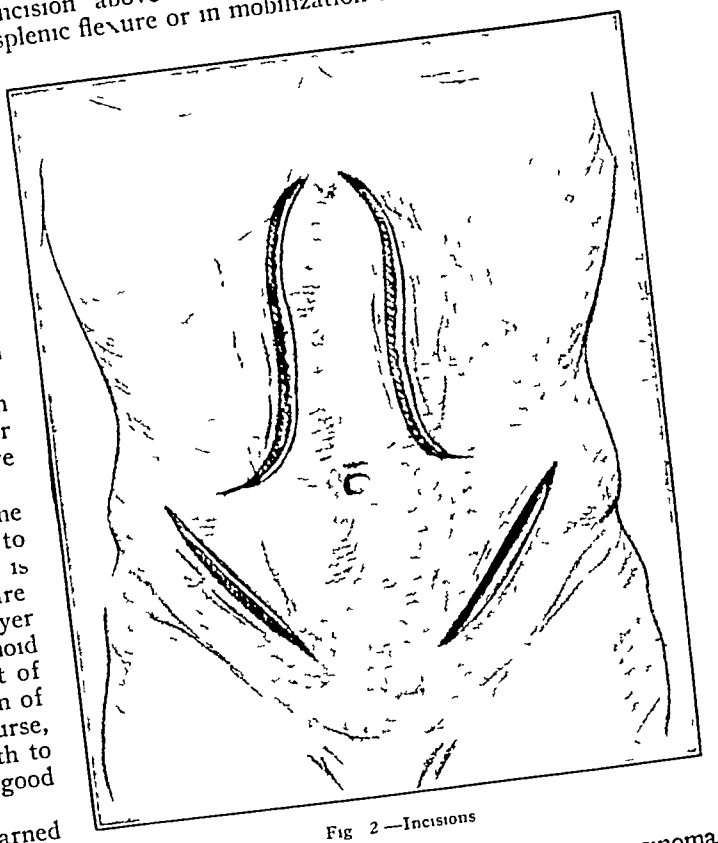

Fig 2—Incisions

a large S-shaped incision on the left side, in carcinoma of the descending colon or sigmoid a large muscle-splitting incision on the left side

Immediate closure in these cases should be made, with drainage well down through the peritoneum to the site of the anastomosis, with a small cigaret drain, which is to be left in place from twenty-four to forty-eight hours

The cases of cancer of the colon that come to us with obstructive symptoms present a more difficult and complicated picture If we have definite knowledge of the location of the carcinoma we can plan the colostomy, which is essential as a preliminary step, to the best advantage, for instance, if we know that the sig-

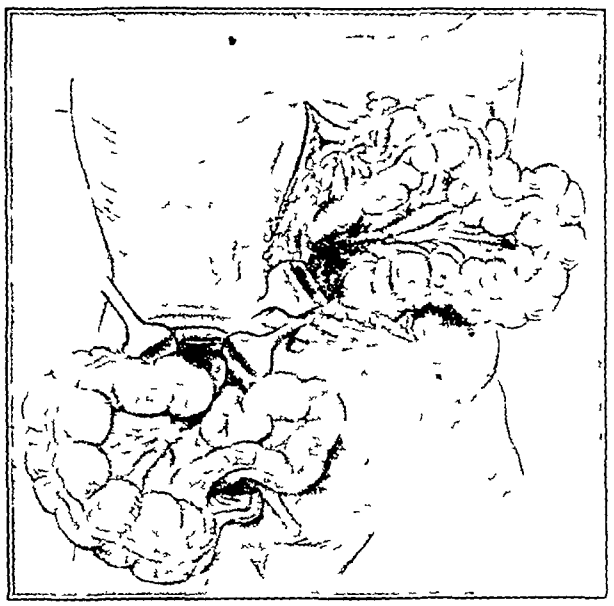

Fig 3 —Mobilization of bowel

moid is involved, we can employ the sigmoid or descending colon for our colostomy opening, if the colostomy is to be permanent If, however, it is but temporary, a colostomy in the cecum is preferable, as it leaves us a free, clean field for the resection When, however, there is any doubt as to the location, as I have just stated, we should make it a rule to make a *right sided muscle-splitting incision and employ the* cecum, ascending colon or the ileum When the condition of the patient warrants, at the same time that the colostomy is made the hand should be introduced into the peritoneal cavity and a thorough exploration made to determine the exact location of the primary lesion and the question of metastases or radical lymphatic involvement In some cases, however, when the condition of the patient is bad and the operation is performed under a local anesthetic, this general exploration of the abdominal cavity may be difficult or inadvisable If the patient recovers from the obstructive symptoms after the colostomy is made, then a careful fluoroscopic study of the colon is later undertaken, and, if the condition warrants, later a radical resection is to be undertaken

THREE-STEP OPERATION VERSUS THE MIKULICZ OPERATION

You will notice that I have not mentioned the Mikulicz operation as yet in this discussion Many surgeons in handling cases of cancer of the colon employ the Mikulicz operation in a large percentage of their operations I want to submit a plan we have adopted in our clinic which I believe is of much greater service than the Mikulicz operation This is what we call the three-step operation I can best describe it by giving the history of some of the typical cases in which we have employed this method

CASE 1—A year ago a woman, aged 40, was brought into our clinic with obstructive symptoms of a moderately severe degree She was quite distended, although her general condition was fairly good Fortunately, Dr Ralph Brown had obtained a fluoroscopic examination and some roentgenograms of the case before the obstructive symptoms developed, and these revealed a filling defect about the middle of the sigmoid Because of the obstructive symptoms I first made a muscle-splitting incision on the right side brought up the cecum with our button suture and performed the colostomy which I have described Within four weeks she was in very good condition, the artificial anus functioning very satisfactorily, and she was in a condition to stand the radical operation of resection I then made a muscle-splitting incision on the left side resected the carcinoma, which was located at about the center of the sigmoid and made a side-to-side anastomosis She made an excellent recovery from this operation Four weeks later, under a local anesthetic, I closed the colostomy opening on the right side The patient is now in excellent condition, has regained her former weight, and has made a perfect recovery She has on her abdomen two oblique incisions like appendix incisions, one on the right and one on the left side, perfectly clean fine scars without any tendency to hernia or bulging, and she is, in fact, quite normal in every way

CASE 2—A man aged 65 was brought into my clinic the extreme picture of obstruction We had absolutely nothing to guide us as to the location and cause of the obstruction Under local anesthesia I made a right-sided muscle-splitting incision, found the enormously dilated cecum and made a colostomy with our button suture method, with immediate relief by introducing a catheter into the caliber of the intestine *The man was in such a serious condition that it took* six or seven weeks for him to recover sufficiently to warrant the radical operation In the meantime careful examination revealed a small circular carcinoma at the splenic flexure

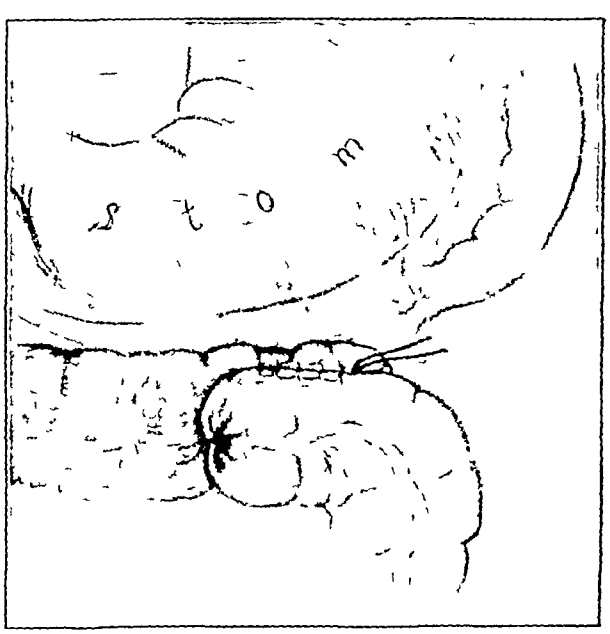

Fig 4—Lateral anastomoses of colon at splenic flexure.

The second step in the procedure was an S-shaped incision on the left side free mobilization of the splenic flexure and the transverse and descending colon and resection of the carcinoma and side-to side anastomosis Four weeks after the resection of the cancer the third step of the operation was performed and under local anesthesia the colostomy was closed He now has a perfectly clean scar like an appendix scar on the right side, and a perfectly clean S-shaped incision scar on the left side.

This three-step operation in the presence of obstruction to my mind is very much more satisfactory than the Mikulicz operation It is, I believe, a safer procedure and one that is in no way blind It secures immediate relief from the obstruction, it enables us to make a much more radical operation of resection of the carcinoma than does the Mikulicz, and it is much more satisfactory to the patient than the Mikulicz plan

Carcinomas from the cecum to the lower part of the sigmoid, which can be handled after the method I have outlined and which are limited to the primary focus, give an excellent prognosis of permanent cure if early recognized and radically removed Carcinomas of the rectosigmoid form a peculiar, unfavorable group both from the standpoint of the practical management of the operative technic and from the standpoint of ultimate prognosis I have here run the gamut of the various methods that have been advocated I am now in a position to present my views without having any longer much question as to the best plan of procedure My views are these that in carcinoma of the rectosigmoid a wide mobilization through the abdomen should be undertaken, the carcinoma removed, a left inguinal colostomy made, when feasible the rectum invaginated and excluded from the peritoneal cavity by purse-string sutures, and when advisable, of course, from the extent of the involvement, removal of the entire rectum One must use good judgment in determining this matter There is nothing to be gained by the removal of the lower 4 or 5 inches of the rectum which is in no way involved If the carcinoma of the rectosigmoid is limited and can be completely removed, the lower portion of the rectum should be allowed to remain

In carcinomas of the rectum itself we are employing with great satisfaction, if the carcinoma does not extend up into the bowel more than 3 or 4 inches and is not too extensive, a method of splitting the rectum posteriorly after removal of the coccyx, bringing the entire operative field will into view and in just the same control as one might an epithelioma of the lower lip, then cutting out the lesion with the electric cautery, saving as much of the rectum as is absolutely free of disease, closing with catgut suture the raw surface from which the carcinoma has been dissected, packing with iodoform gauze, and obtaining, as we must necessarily in these cases, wound healing by granulation We have been gratified to find what good control the patients have secured after very extensive local operations for carcinoma of the lower 3 inches of the rectum These operations are, of course, of the atypical type We have a number of patients who have been operated on two, three, four and five years ago and who report to us regularly that they are free from recurrence and that they have very satisfactory control

Finally, there is a limited group of cases in which the rectum is so extensively involved that the best procedure seems to be a Kraske operation, with complete removal of the rectum and the making of a sacral anus We have learned, as other surgeons have learned, not to force the Kraske operation to cover too extensive a field and to attempt to remove not only the rectum but the rectosigmoid and part of the sigmoid itself by this method, because although most of the patients survive and many give very satisfactory results, there is too great a possibility of necrosis from cutting off of the blood supply when this is undertaken Such cases are preferably handled through the abdominal route

One final word from our experience, regarding the tube resections that seem so attractive on paper and have been so widely employed Our own experiences have been that although we have had some very satisfactory results, on the whole the tube resection should be discarded

---

CANCER OF THE RECTUM*

G W CRILE, M D
CLEVELAND

The ideal for the surgical treatment of cancer of the rectum, as of any other pathologic condition, is maximum operability, maximum percentage of permanent cures, and the reduction of the immediate mortality to zero

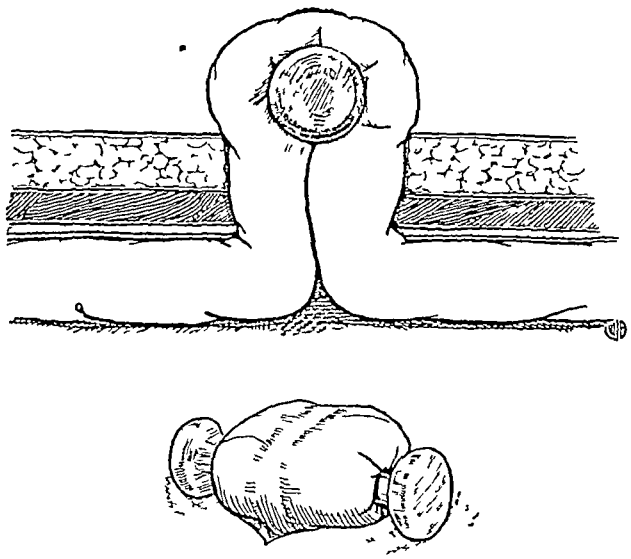

Fig 1 —Angulation of colon by short flanged glass tube

The possibility of a permanent cure of cancer of the rectum by operation depends more on the stage at which the case is presented for operation than on even the most thoroughgoing technic, but maximum operability, which means a safe operation with the removal of the maximum amount of tissue surrounding the cancer, is a possible attainment

To cancers which involve the lumbar muscles, which penetrate the bladder, which involve the liver, etc, operability does not apply Such cases are inoperable When we speak of increased operability we mean that the technic has been so improved that all but the anatomically inoperable are given the maximum chance for survival

We believe that this implies such surgical control that any method—the posterior, the combined, the abdominal—may be used with equal facility to afford the maximum chance of permanent cure

The evolution of the management of these cases has followed lines analogous to those by which the management of exophthalmic goiter cases was developed, that is, the operation is individualized—

* Read before the Section on Surgery General and Abdominal at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

the type of operation and of postoperative care follows the anatomic and pathologic indication In brief, procedures follow indications—not rules

Reports of mortality attending operations for cancer of the rectum are given in the accompanying table

RADICAL OPERATIONS FOR CANCER OF THE RECTUM

III TOTAL SERIES OF OPERATIONS FOR CARCINOMA OF THE RECTUM INCLUDING COLOSTOMIES FOR OBSTRUCTION			
G W Crile and associates	1900	1 8	12 5
G W Crile (personal last series)	1920	38	0 0

A critical examination of the causes of death as reported in the literature and as found in our own series showed that the principal cause was not hemorrhage or shock, but that death was generally due to infection and to the absorption of the toxins of feces A laboratory investigation showed clearly that the effects of the injection of the toxins of feces were surprisingly poisonous This fact associated with the fact that there exists a large surface for absorption in the field of operation, gave an important clue It followed that the first surgical step should be the complete diversion of the fecal stream by a preliminary colostomy This is usually performed under analgesia and local anesthesia, and causes but little depression We are satisfied that the best colostomy is of the Littlewood type, i e, an intramuscular incision below the border of the ribs The Sistrunk technic answers well also The incision for the colostomy is made large enough to ascertain whether or not there is involvement of the liver or of the lymphatic glands, as well as the extent of the local invasion Of prime importance is the management of the colostomy so that every particle of the fecal stream is diverted and none passes through the rectum This is accomplished by a sharp angulation of the colostomy, which is secured by the insertion of a short flanged glass tube under the loop of colon and on the surface of the skin (Fig 1)

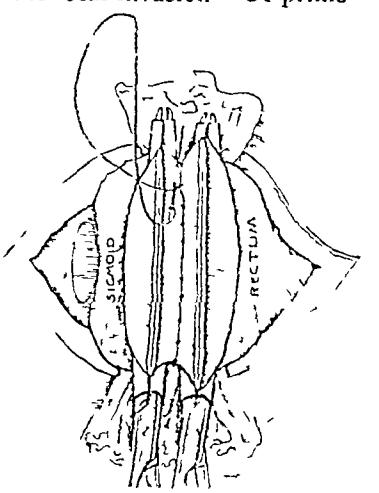

Fig 3—Technic of excision of the rectum continuous right angle stitch

At the end of a week or as soon as both the local and the general conditions warrant it, the major operation is performed (Figs 2-6) Whether the technic is intra-abdominal or posterior or the combined operation, a wide excision of the growth and of the surrounding structures is made If an end-to-end anastomosis is made, a rectal tube (Mayo) is passed through from the anus Infection of the field is at first controlled by means of packing with iodoform gauze well wrung out, but as soon as the suture line is secure, the Carrel-Dakin method is employed The wound must be kept clean at all times Because of the colostomy, nourishment need not be suspended and the bowels may move

If the operation is extensive and of a nature to presuppose the development of peritonitis, or should peritonitis unexpectedly appear, the opium-water-posture-heat method is at once inaugurated This method is all but specific

Should there be secondary anemia, a blood transfusion is made promptly without waiting to discover whether the patient is going to do well or ill As in the treatment of shock, it is a grave error to allow a patient to remain in a state of low blood pressure in the hope that he will improve through his own resources, reserving a blood transfusion to be used as a last resort after it has become apparent that the patient is going to die

Should healing be retarded, a blood transfusion is made

Whatever his condition, the patient is given the benefit of a dietetic and hygienic regimen identical with that for tuberculosis—forced feeding and fresh air in abundance

When the intestinal healing is complete and not until then, the temporary colostomy is closed by a plastic operation and the sigmoid loop dropped back into place

Our confidence in the value of these procedures is based on a comparative study of seventy-two opera-

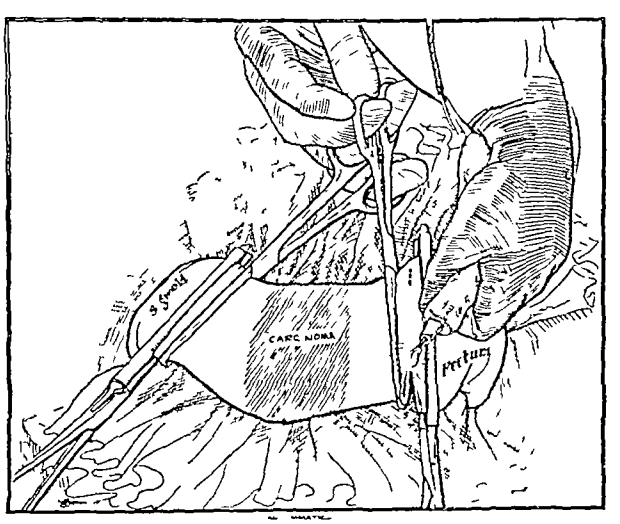

Fig 2—Technic of excision of cancer of the rectum excision of carcinoma

tions for cancer of the rectum performed by my associates and myself with a mortality rate of 9 7 per cent

My series, since the foregoing plan has been followed, consists of thirty-eight operations, twenty of which have been radical with no death

The end-results of this series will be reported in a later communication

ABSTRACT OF DISCUSSION

ON PAPERS OF DRS BEVAN AND CRILE

DR DANIEL F JONES, Boston Dr Bevan brought out points which will help to lower the mortality from carcinoma of the colon There are two principal reasons for the great improvement in our statistics first, the mobilization of the colon, for which, I believe, Dr Mayo is responsible, and, second, providing a safety valve which Dr Bevan does by a colostomy or a cecostomy There are several other methods of obtaining relief from gas above the line of sutures, one is an enterostomy by the Witzel method, as suggested by Dr Charles Mayo, another is by putting a tube through the anastomosis from the anus No improvement has been made in the great majority of surgical conditions, except through the cooperation of the general practitioner We talk much about the improved technic of operations for acute appendicitis as being responsible for the lower mortality rate, but, as a matter of fact, the real reason is that the family physician sends these patients to us early Our results in cases of carcinoma of the colon and rectum will be bad until the family physician sends these patients to the surgeon early The general practitioner cannot be expected to make a diagnosis of carcinoma of the colon, but if he knows the suggestive symptoms, he can send the patients to some one who can make the diagnosis, and then early operation can be made In many parts of the country the general practitioner takes it on himself to determine whether the case is an operable one or not He usually determines that it is not operable The surgeon is the only one to determine this question, not the general practitioner Dr Crile leaves no room for argument Statistics are of little value however, unless it is known in what percentage of cases seen by the surgeon an operation was performed For instance Cripps saw 409 cases and operated in 100 His percentage of cures was very high and his mortality was low Dr Crile is right in suggesting that a colostomy be done first as in carcinoma of the colon In the combined two-stage operation, the colostomy is always done as the first stage, this gives an opportunity to remove the rectum at the second operation with very little disturbance to the patient The convalescence is made safe by keeping the wound in good condition by the use of the Carrel-Dakin method Dr Crile's record of twenty cases without a death is very remarkable. I think we can all approach this, however, if we carry out his suggestions

DR WILLIAM J MAYO, Rochester, Minn There is no doubt that the principles Dr Bevan laid down and Dr Crile's advice with regard to the care that should be given these patients after operation will improve results in these cases materially The question of operability is interesting In most large hospitals the patients are sent in for operation not by skilled men of large experience, but by men of less experience, and a very large percentage are sent home from the dispensary as hopeless cases I think that this is true of practically all the large hospitals of this country in the ordinary dispensary form of examination In our early work in this field we had a low mortality, about 5 per cent, and a high percentage of cures, between 50 and 60, but 75 per cent of the patients who came to the clinic, taking them as a whole were sent home as hopeless cases Only thirteen of one hundred patients were alive and well after five years, and we had the paradox of a low mortality and a high percentage of cures, yet few cures We increased operability up to an average of 70 per cent and we had twenty-seven instead of thirteen patients alive at the end of five years, but the mortality percentage had gone up and the cures had come down It is difficult to study this question from the standpoint of mere incidence of mortality The patient and the patient's family and the friends are not very happy over a permanent colostomy, and when the patient is told that by a permanent colostomy the mortality will be reduced about 10 per cent, he will take the increased risk if he has a reasonable chance of having his bowels move in the normal manner It is a fact that the price the patient must probably pay for the opportunity to recover from the operation and remain well is a permanent colostomy I shall look into the operation described by Dr Bevan with great interest because he says function is preserved I have had many patients who after radical operation have a controllable anus in the normal situation, and are alive and well for many years For the present, a permanent colostomy will be necessary in the majority of cases, but earlier operation and better technic will secure more desirable results

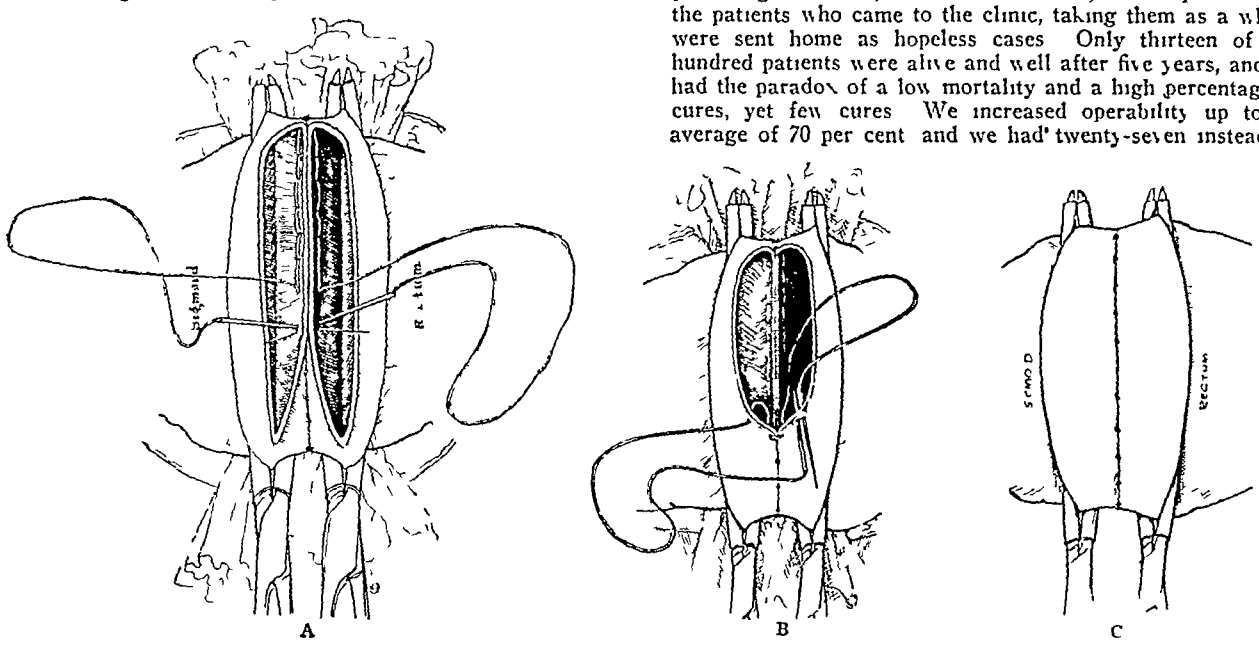

Fig 4.—Technic of excision of cancer of the rectum closure of end to-end anastomosis *A* cobbler stitch (Step 1) *B* cobbler stitch (Step 2) *C* cobbler stitch complete

DR H J WARING, London, England Dr Bevan's paper bears out to a great extent my experience In my early days of surgery, I found that in carcinoma of the large intestine if one attempted resections with end-to-end anastomosis the mortality was very high I soon learned however, that one of the main causes of this was the inability of the bowel in which there is obstruction to join on the part in which there

is no obstruction So I early adopted the principle of making a colostomy on every patient who had a growth in the large intestine Two of the incisions I made resembled those of Dr Bevan's, one on the right side and the other on the left side, an oblique muscle splitting incision In the upper one I did not make an S-sharped curve I almost invariably make a vertical incision within the lateral margin of the rectus abdominis, splitting the posterior sheath I have found by experience that in the majority of cases this incision gives a strong abdominal wall I also adopted the third method first colostomy, second, excision of the growth side-to-side anastomosis and later closure of the colostomy I cannot give statistics from memory All I can say is that the mortality has been decreased enormously As regards the surgery of carcinoma of the rectum, I have had to a considerable extent the experience of Dr Charles Mayo In England whether it is owing to the inferior education of a considerable number of the general practitioners, or because of the desire of the patient not to come under observation at an early stage a very large proportion of patients come at a late stage of the disease When an inguinal colostomy is done an incision is made to introduce the hand into the interior of the abdomen to make out the primary disease and secondary invasion in the adjacent structures When that has been done the decision is made as to what the further procedure shall be In regard to the method of colostomy I always create a well marked curve I generally bring the colostomy mattress suture behind the bowel and bring the loop of the bowel over, putting in two sutures Mr Harrison Cripps, whom I assisted for some time selected his cases carefully His operations were done entirely by the peritoneal route, except in well localized cases of the disease If the growth was adherent to parts around or extended beyond, and was not freely movable, then an excision was not done but a colostomy

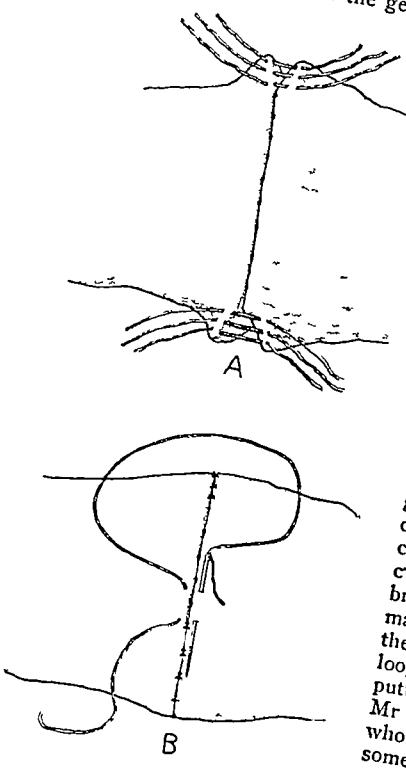

Fig 5—Technic of excision of cancer of the rectum closure of end to-end anastomosis *A* stay sutures *B* interrupted right angle stitch over cobbler stitch *C* complete anastomosis

DR. GEORGE W CRILE, Cleveland Inasmuch as I did not describe the technic I may have left the erroneous impression that the colostomy is permanent This is not so the colostomy is merely temporary At the resection an end-to-end anastomosis is made and cutting off the entire fecal stream at a point above is vitally important especially when the posterior operation is performed which leaves a large absorption area After the anastomosis is healed then as Dr Bevan has described, the temporary colostomy is closed and returned I do not advise operation in the following groups of cases first if there is any involvement of the liver second if there is penetration into the bladder or prostate and third if the penetration goes into the lumbar

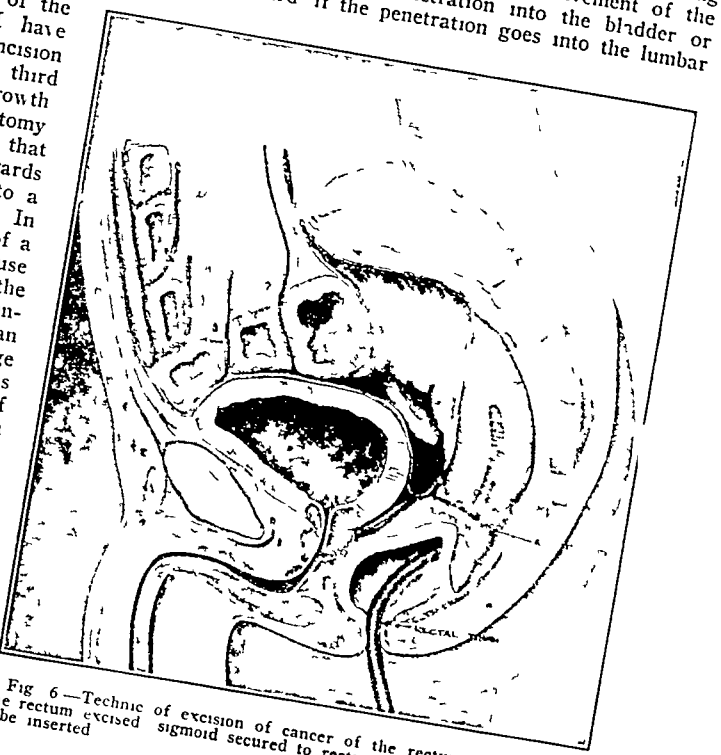

Fig 6—Technic of excision of cancer of the rectum carcinoma of the rectum excised sigmoid secured to rectum by cobbler stitch rectal tube inserted

muscles In the absence of these conditions I always attempt a radical cure By assembling a plan of procedure by means of which the operation is rendered relatively safe we are able to extend the operability accordingly and to widen the scope of operation Only in exceptional cases have I failed to secure anastomosis of the intestine and normal defecation

FEMORAL HERNIA OF THE OVARY*

W W GRANT M D
DENVER

The subject of femoral hernia of the ovary has received it would seem, less consideration than its importance requires The condition is probably more frequent than the few reports indicate, yet, at best, it is not of common occurrence

The decadence of diagnostic skill and efficiency, in general, and the subordination of clinical investigation of disease phenomena to laboratory tests and instruments approaching scientific precision doubtless account in a measure for this condition and for many unnecessary errors in the practice of medicine and surgery Yet it is to be remembered that, especially in ovarian hernia, there is no absolutely conclusive evidence of the contents of the sac, short of demonstration by operation

Prolapse of the ovary is not hernia The very rare forms of ischiatic and obturator hernia of the ovary are chiefly of academic interest For those who may be interested enough to pursue the literature of the

* Read before the Section on Obstetrics Gynecology and Abdominal Surgery at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

subject and to read the most complete reports and outlines of the subject yet made, I may refer to the paper by Robert Barnes[1] of London, and to the most thorough compilation from 1890 to 1910 from the French, English and German, by Heineck[2] of Chicago, while the very interesting paper by Barnard Fuller[3] of London on "Femoral Hernia" should receive special mention A few other miscellaneous reports are found in current literature

Of thirty-eight cases tabulated by English, twenty-seven were inguinal and nine femoral Of 137 cases reported by Heineck, only thirteen were femoral It is clearly manifest that most cases are of the inguinal variety—eight times as many as of all others—and it is not common, while the crural, from experience and by record, is rare It is usually unilateral The predisposing cause is the persistence of the canal of Nuck occupying the analogous position of the processus vaginalis in the male It occurs generally after the postpartum period of life A lax mesentery and stretching and mobility of the broad ligaments by pregnancy is probably a contributory cause The immediate exciting cause is increased intra-abdominal pressure due to a variety of well-known causes The points of least resistance fail first When the tube is present in femoral hernia it is considered congenital The herniated ovary may be normal or pathologic

I report two cases operated on for ovarian hernia in the crural canal, ut I have under observation two her cases of femoral hernia in hich the clinical history of each is such as to satisfy me that both are cases of uncomplicated ovariofemoral hernia One, a woman of 77, has had femoral hernia, right side, for ten years, and until the last two years it would easily protrude and be just as easily reduced by the patient Two years ago its occurrence resulted in pain and some inflammation, which produced a certain amount of constriction and fixation by adhesions In this condition it remains and gives practically no trouble Operation was declined She has had two children It is a small, almond-shaped body and could easily be outlined

Fig 1—Follicular ovarian cyst natural size removed from patient *A* ovary, *B* omentum *C* cyst

The other is a married woman of 35, having no children, the hernia comes and goes with lifting, but is returned without difficulty I have examined the patient carefully when the mass protruded through the femoral ring The objective examination and its shape and size indicate that it is ovarian In neither of these cases was there ever any evidence or indication of intestinal constriction or of a mass of omentum, which I would hardly expect to exist alone or as an uncomplicated hernia of the femoral canal

REPORT OF CASES

CASE 1—Mrs L J a widow, aged 37, mother of two children, had been troubled with a periodic protrusion of a small mass at the upper and inside of the left thigh for two or three years There was no pain or discomfort, except when it protruded, but finally it became nonreducible, because of mild inflammatory attacks On examination at different times, I found always a small almond shaped mass in the crural canal I thought it probably ovarian and advised operation, which was performed at St Luke's Hospital, Jan 23, 1917 I removed a small, somewhat atrophied ovary, which was confirmed by histologic examination, though it was macroscopically manifest The patient is a domestic—cooks and does general housework I see her not infrequently—the last time two months ago—and she has had no recurrence and feels perfectly well The surgical technic is described in Case 2

CASE 2—Mrs S, a widow, aged 56 years, mother of two grown sons, did ordinary housework in her own home—often washing clothes, etc According to her statement, in 1892 while carrying a 2 year old child, she slipped on the ice and it was then the hernia occurred, she suffered for several days from it and it was then she got a truss and wore it from then until I operated on her It never gave her much trouble until (she called Dr Faith) in August, 1916 It was about five years ago that she noticed the enlargement or tumor just below the hernia It never gave her any distress except when the truss would slip out of place, then the hernia would come down and give her pain, she would have to put it back and adjust her truss to hold it back It was April 9, 1919, that it came down permanently and she could not get it back It never gave her trouble in urinating, or at menstruation time

April 17, 1919, she was sent to me for operation Examination revealed a steel spring truss applied to the left groin The marked depression and discolored, atrophied skin showed that she had worn it faithfully The mass in the femoral canal could be fairly outlined The tenderness and discomfort had been aggravated by recent efforts at reduction From its doughy feel on palpation, with no evidence of intestinal involvement, I thought the tumor at least partly omental I operated the following day, April 18, at St Luke's Hospital, by making the usual incision slightly below and parallel to Poupart's ligament, though making a slight downward curve over the tumor, and turned the skin flap up a short distance above Poupart's ligament The sac and tumor were easily exposed, but I found it necessary in order to dislodge the tumor, to make a downward incision, 2 inches long from the inner angle of the primary incision over the pubic spine, with this the mass was easily delivered It had passed partly out of the saphenous opening The normal ovary was lying just below the femoral ring with the omentum greatly constricted by the ring The omental mass was next in order, and at the lower end was the follicular ovarian cyst The mass measured 5 inches in length The fringed edge of the capsule divided in the operation may be likened to the fimbriae of the tube, but the latter was not involved in the hernia The ovarian pedicle and constricted omentum were ligated separately and the stump of each returned to the abdomen by finger pressure without any difficulty The sac was transplanted and pouched by making a short incision one-half inch above Poupart's

ligament, and curved pressure forceps guided by the index finger in the ring were forced from above through the ring—the fundus of the sac grasped and pulled out of the wound above the ligament Under moderate stretching the sac was ligated close to the fascia with No 1 chromic gut and cut off The same ligature was now armed with a short full curved needle and the incision closed over the stump, which was forced just beneath the surface It was fixed at this point. This technic, it is claimed by Kocher, with reason and extensive experience, removes from the ring whether femoral or internal oblique inguinal hernia, a weak point, which remains when the stump of the sac is left in the ring I closed the ring with two silk stitches through Poupart's and Gimbernat's and Cooper's ligaments, and then with chromic gut, passed first through Poupart s ligament from without inward and the fascial tissues gathered in purse string suture and the needle carried back through Poupart's ligament, this time from within outward and near the primary insertion Traction on the two ends now pulls the puckered fascial tissues directly to the ring, which closes the canal as well as the ring and, in my opinion, makes a stronger, more effective and durable barrier against recurrence than is afforded by the usual methods of operation and of even the normal crural septum It is simple—not so elaborate as when Poupart's ligament is divided and the inguinal canal exposed and, it seems to me, it adds a desirable finishing touch to a delicate and important procedure The 3 or 3½ inch incision gives in most cases, ample room in which to expose the sac and the ring and to apply sutures The skin wound was closed with a running stitch of chromic gut, though I usually use for this purpose a subcuticular stitch of silkworm gut The patient is perfectly well, with no discomfort or sign of recurrence

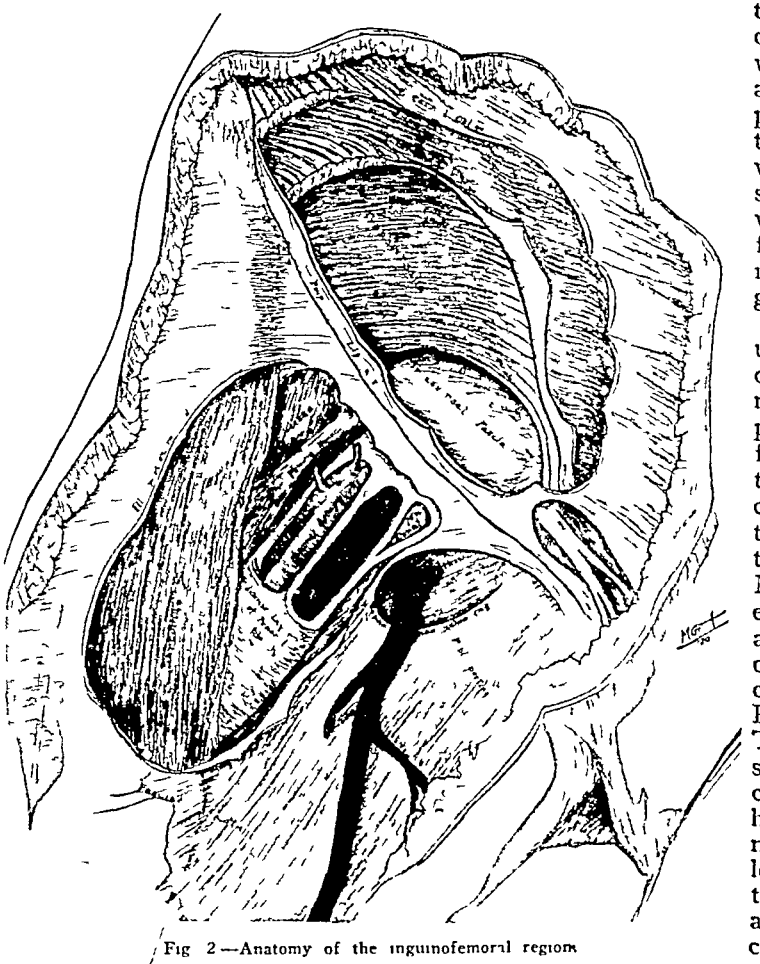

Fig 2—Anatomy of the inguinofemoral region

COMMENT

The unusual and interesting features of this case encourage its report in such detail as seems necessary to a satisfactory presentation of the case as well as of the subject It will be noted that this woman wore a truss constantly for twenty-five years for a hernia—the most difficult and intractable of all hernias to treatment by a truss, and that only on two occasions (August, 1916, and April, 1917) after the initial stage, did she have any attacks of pain Whether the hernia was ever completely reduced is a matter of conjecture, but it is certain that it had not been since she noticed and felt the tumor in the thigh five years previous to operation, during which time the cyst doubtless developed

No reducible, herniated ovary should be removed during the child-bearing period if it can be effectively replaced within the abdomen and its recurrence prevented by operation At other times and when required by pathologic considerations, its removal is advisable

In all operations for femoral hernia, the relation of the femoral vein to the ring should ever be in the mind of the operator

The two chief characters of the Kocher technic in crural and inguinal hernias are the transplanting and pouching of the sac and the use of nonabsorbable stitches in the repair of the posterior wall and in the closure of the crural ring in femoral hernia

At the Fort Logan Recruiting Depot in the spring of 1918, I operated in 110 cases of hernia, most of them oblique inguinal with well formed sacs, only three femoral and two of these long standing, with distinct sacs In all such cases I employed the Kocher technic with such varying modifications suitable to the individual cases as not infrequently invites the initiative of the surgeon

I do not believe it usually necessary to open the inguinal canal, or to divide Poupart's ligament in femoral hernia as introduced and advocated by Kammerer in the Lotheisen operation, nor that of Moschcowitz and others who proceed from above downward, opening the inguinal canal and dividing Poupart's ligament This might be necessary in exceptional cases of strangulated hernia The Bassini method is simple, but leaves the stump of the sac in the ring, and Bassini closes the canal by cross stitches, while Macewen makes a pad of the sac as in inguinal hernia

I do not share the objection to the use of the nonabsorbable stitch on the ground that it may become infected and have to be removed Infection is usually fatal to the perfect success of any procedure in plastic surgery, but silk and linen should be the last material to introduce it The surgeon should have more confidence in their sterility, obviously it seems to me, than in any form of catgut He can, as is my custom, resterilize the former at the moment of operation, and if the field of operation and everything else is aseptic, there should be no fear of infection or of the future of the silk

Especially in hernia operations subjected as the parts are to constant intra-abdominal pressure of

varying degree, it is of unusual importance that the reconstructed canals and rings should be strongly supported until the fascial tissues especially are in a perfect state of repair, and this does not occur within ten days But I do not think the permanent nonabsorbable stitch necessary in ordinary abdominal wounds for the usual intra-abdominal conditions

ABSTRACT OF DISCUSSION

DR GEORGE H LEE, Galveston, Texas Femoral hernia is usually stated to form about 10 per cent of all hernias It is probably never congenital, being the result of the relaxation of late adult life and intra-abdominal pressure, and it has been frequently connected with childbearing Dr Grant says that there is no conclusive evidence that enables a diagnosis to be made definitely before operation, and yet two of his patients have not been operated on and the data he gives

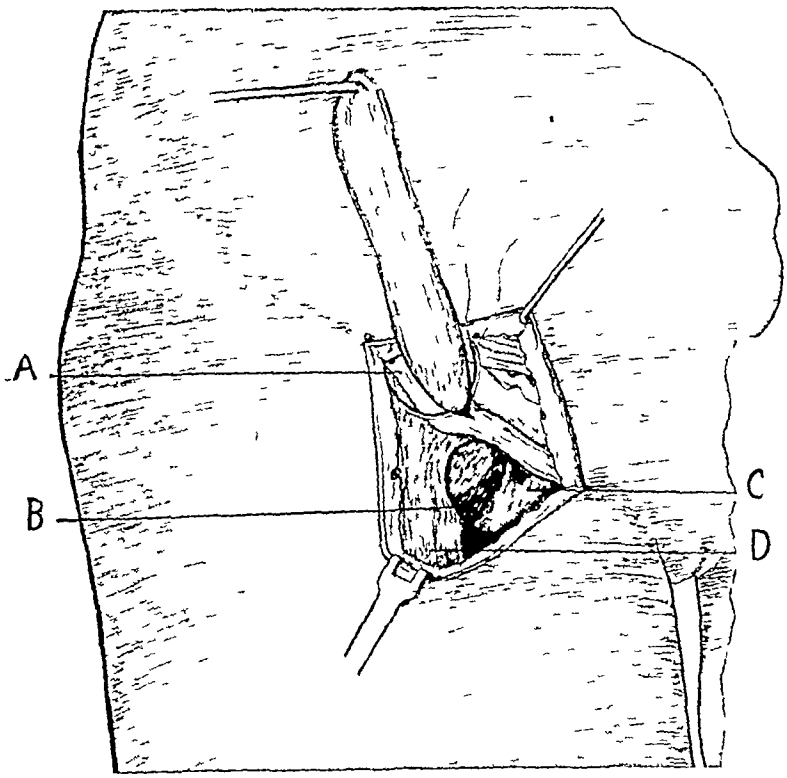

Fig 3 —Transposition method in the radical treatment of femoral hernia (Kocher) *A*, Poupart s ligament, *B* crural canal *C* pectineus fascia, *D* femoral vein in sheath

in connection with those cases would seem to fully substantiate his diagnosis The diagnostic symptoms are the presence of a movable or immovable, more or less almond shaped and almond size body tender on pressure and producing nausea if firmly pressed When the hernial contents include also omentum, intestine or a cyst, as in one of Dr Grant s cases, the diagnosis is correspondingly difficult and indefinite

DR WILLIAM W GRANT, Denver I think the cyst was follicular ovarian, because of its position at the time of operation and the fact that the content was a clear whitish liquid I was careful not to attempt to free the cyst from the mass, because of the danger of rupturing it, and I was anxious to preserve it intact In reference to the contents of the hernial sac It is not difficult when it is a simple uncomplicated ovarian hernia of the femoral canal, but when complicated with other pathologic contents these cannot be differentiated except by operation None of the cases reported presented any symptoms whatever of bowel strangulation or constriction, therefore it was not difficult to exclude the intestine The case from which the specimen was removed was unusual I have never seen any such specimen in either femoral or inguinal hernia The neoplasm is especially an interesting feature

RELATION OF HYPERPLASIA OF ENDOMETRIUM TO SO-CALLED FUNCTIONAL UTERINE BLEEDING*

EMIL NOVAK, M D
BALTIMORE

In most cases of uterine hemorrhage a definite anatomic cause can be found in the internal generative organs—the uterus, the tubes or the ovaries With amenorrhea, by contrast, the cause is most frequently of a constitutional nature In a certain proportion of those cases of uterine bleeding which are due to frankly anatomic causes, the mechanism of the abnormal hemorrhage is clear This is preeminently the case with such destructive lesions as cancer, in which the bleeding is quite easily explained by the actual opening up of blood vessels, as a result of ulcerative processes

In a second group of cases, bleeding is associated also with gross disease in the pelvis, but the explanation of the mechanism involved is not so clear This type is well illustrated by the ordinary form of pelvic inflammatory disease Is the menstrual excess which is so often seen in these cases due merely to an exaggeration of the normal menstrual hyperemia, or is it to be explained, as some assert, by a more fundamental disturbance of the function of the ovary, which is so commonly involved in the inflammatory process? There is no little evidence to support the latter point of view, which has been championed by Hitschmann and Adler[1] For example, hemorrhage is frequently absent, even in the most severe cases of adnexitis, in which a high grade of pelvic hyperemia is present On the other hand, it is frequently present in old low grade inflammatory conditions, in which there is little or no active hyperemia Hemorrhage is certainly not due to hyperemia alone, for it is unusual at any other time than at the menstrual periods Furthermore, pelvic inflammation does not tend to cause uterine bleeding after permanent cessation of ovarian function, that is, after the menopause As a matter of fact, it is difficult to conceive how even the most intense hyperemia of the uterine mucosa could in itself cause bleeding on the scale so often observed in cases of menorrhagia It is suggestive, also, that removal of the ovaries will always check bleeding in this class of cases Many other facts might be adduced to lend weight to the contention that the abnormalities of menstruation so frequently associated with pelvic lesions are probably to be classed as functional, in the sense in which this much abused term is usually

* From the Gynecological Department of the Johns Hopkins University Medical School

* Read before the Section on Obstetrics Gynecology and Abdominal Surgery at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

employed There is nothing surprising in this explanation when we bear in mind that the normal hemorrhage of menstruation is universally conceded to be due to the internal secretion of the ovaries

CLINICAL CHARACTERISTICS OF FUNCTIONAL UTERINE BLEEDING

The type of functional hemorrhage with which I propose to deal in this paper, however, embraces a much more limited group of cases—those in which no demonstrable pelvic disease exists Hemorrhage of this functional, idiopathic or essential type, as it has been variously called, is especially common at puberty (hemorrhage of puberty) and at the menopause (climacteric or menopausal hemorrhage) By far the largest number of cases is observed at or about the menopausal age The great practical bearing of this fact is obvious, in that one is frequently called on to distinguish between functional hemorrhage and that due to early carcinoma This distinction is usually possible by means of, and only by means of, the microscope Although most common at the two extremes of menstrual life, functional uterine hemorrhage may occur at any period during the reproductive life of the woman The bleeding is characteristically of the type of menorrhagia, rather than metrorrhagia, although the latter occasionally occurs In some of these cases, however, the metrorrhagia is apparent rather than real, the menstrual periods being so much prolonged that bleeding is practically constant In itself there is no pain associated with this form of uterine hemorrhage It is interesting to note that in these cases menstruation is often delayed, and it is not infrequent to observe periods of amenorrhea, lasting, in some cases as long as several months Many factors have been invoked in the effort to explain bleeding in cases of this general type—arteriosclerosis of the uterine vessels, the "insufficientia uteri" of Theilhaber, and other theories

HYPERPLASIA OF THE ENDOMETRIUM

The first point which I should like to emphasize is that a very common histologic finding in these so-called functional cases of uterine bleeding is the condition designated as hyperplasia of the endometrium—one of the most distinctive of all lesions of the uterine mucosa The term should not be confused with the older designations of hyperplastic or hypertrophic glandular endometritis, terms which have become obsolete since the advent of our newer knowledge of menstrual histology Hyperplasia of the endometrium, in the sense in which the term is here used, is a condition which was first described, with remarkable accuracy, by Cullen,[2] as far back as 1900 Since then this author has called attention to the condition in various publications, which I[3] reviewed in a previous paper on this subject In hyperplasia there is, as the term indicates, a genuine proliferation of the endometrium —an increase in both its epithelial and stromal elements As a result of this hyperplasia a characteristic pattern is produced

The epithelium is thickened and compact, and at times two or more layers may be present There is no lack of uniformity of the cells as in the case of carcinoma The glands vary considerably in size some are small, others are large and cystic sometimes enormously so (Fig 1) That these large glands are not to be looked on as retention cysts is evident from the fact that the epithelium instead of being flattened out is usually intact The dilated glands are not usually scalloped, as they are in the stage of normal premenstrual hypertrophy, their walls are most frequently quite smooth, and of rather stiff, parchment-like appearance The stroma is very abundant dense and compact, resembling that normally found in the deeper layers of the endometrium Its proliferative activity is attested by the not infrequent occurrence of mitoses, an otherwise rare finding in the stroma, except with malignancy The proportion between glands and stroma varies in different cases and in different portions of the same endometrium It is probable that these variations are in part due to mechanical factors such as the crowding into the uterine cavity of the overgrown endometrium Not infrequently, large, hypertrophic glands are seen immediately beneath the surface where in the normal endometrium, one finds only the narrow necks of the uterine glands (Fig 2) Thromboses are often observed, although their significance is not clear

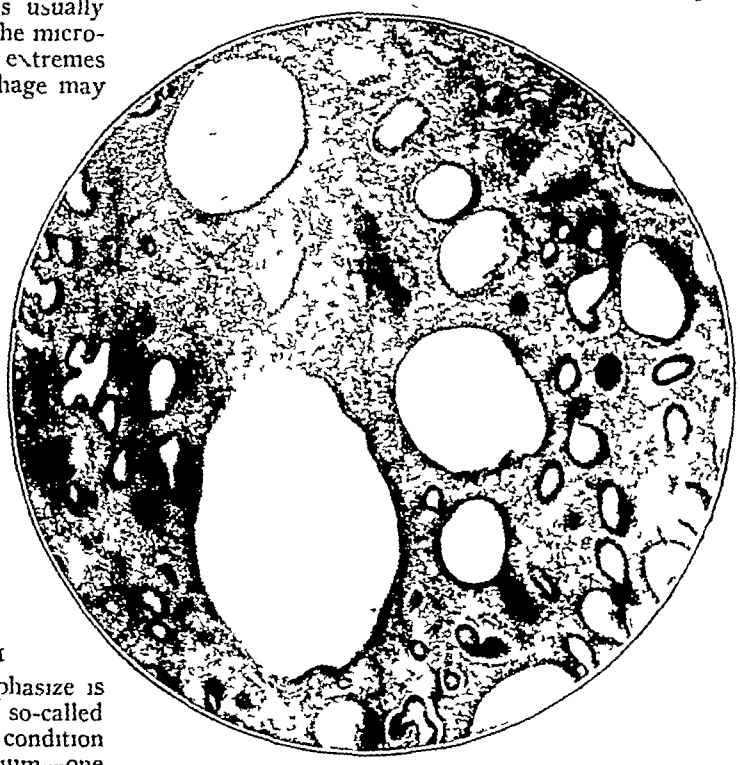

Fig 1.—Hyperplasia of endometrium The patient, aged 44, was subjected to curettage for profuse menorrhagia of eight months' duration The pelvic organs were normal

Grossly the endometrium with few exceptions is much thicker than normal At times it is so luxuriant and polypoid that curetting yields many drams of tissue, and the gross picture of malignancy is thereby closely mimicked However, the microscopic picture presented in cases of hyperplasia is unmistakable in the outspoken case, certainly it cannot be confused with carcinoma This is of much importance when we

2 Cullen T S Cancer of the Uterus New York D Appleton & Co 1900 p 479 Ann Gynec & Pediat 17 413 1904 Adenomyoma of Uterus Philadelphia W B Saunders Company 1908 p 180 Canad M Assn J 3 658 1913
3 Novak Emil Am J Obst 75 996 (June) 1917

recall, as has already been emphasized, that both conditions are characterized by bleeding, occurring usually at or near the menopausal age

THE FINDING OF HYPERPLASIA ONLY IN CASES OF BLEEDING

A large number of cases of hyperplasia of the endometrium have been encountered in the gynecologic department of the Johns Hopkins Hospital In my own experience the condition has never been found except when uterine bleeding has been a symptom, the menstrual history corresponding to the description of the ordinary cases of functional uterine bleeding given in the foregoing While seen most characteristically with the functional cases, it may be associated with lesions that are in themselves notorious producers of abnormal bleeding It is not rare, for example, to find this endometrial condition in cases of myoma and,

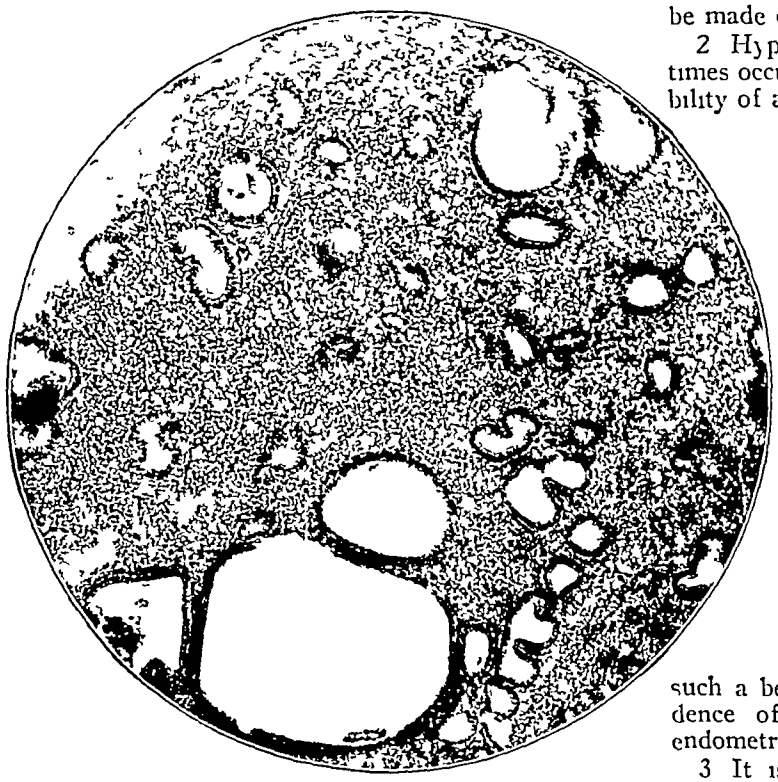

Fig 2—Hyperplasia of endometrium in a girl of 18 years There was excessive menstruation lasting often from three to five weeks since inauguration of function at 14 and frequent amenorrheic intervals

perhaps, even more often, with adenomyoma There is nothing paradoxical in this fact, especially if we bear in mind the possibility, already referred to, that the uterine bleeding in many cases of pelvic disease may, in the last analysis, be due to a disturbance of the internal secretion of the ovaries

THE RÔLE OF THE ENDOCRINE GLANDS

Cases of menopausal hemorrhage, as well as of the hemorrhage of puberty—the very cases in which hyperplasia is found on microscopic examination—are undoubtedly associated with endocrine disorders, even though the exact nature of the latter may be indeterminable in the present state of our knowledge The finding in these cases of such a definite structural alteration as hyperplasia would seem at first sight to speak against the functional nature of the bleeding We must bear in mind, however, that the endometrium is, as it were, only the creature of the ovary Certainly the remarkable cyclic changes of the uterine mucosa which are associated with normal menstruation are directly due to the internal secretory activity of the ovary If the latter is disordered, it is natural to assume that the endometrial response will also be abnormal In the functional hemorrhage that we are now considering, the ovarian secretion is commonly believed to be disturbed, whether primarily or secondarily The fact that the endometrium in such cases shows the typical hyperplasia suggests, therefore, that the latter may be merely the result of the disturbed endocrine function A number of interesting facts bearing on this question may be submitted

1 Functional uterine hemorrhage, as already stated, may occur at any age during menstrual life, but it is most common at puberty and the menopause, especially at the latter period Exactly the same statement may be made of hyperplasia of the endometrium

2 Hyperplasia with excessive menstruation sometimes occurs in very young persons, in whom the possibility of an inflammatory etiology may reasonably well be ruled out Recently, I observed a typical case in a girl of 12 years, who had profuse uterine bleeding for three months Figure 3 represents the microscopic picture of the endometrium from a girl of 18, on whom I recently performed curettage for severe menorrhagia of several years' standing It will be seen that the pattern is identical with that shown in Figure 1, which is taken from a patient of 44 The occurrence of hyperplasia in these very young patients, together with the frequent presence, in such cases, of other endocrinopathic stigmas, points to a probable endocrine origin The histologic picture described in the foregoing as characteristic of hyperplasia of the endometrium has been described by some as of inflammatory origin Driessen,[4] for example, speaks of it as "endometritis necrobiotica" There does not seem to me, however, to be the slightest justification for such a belief Certainly there is no microscopic evidence of inflammation in the typical hyperplastic endometrium

3 It is only during the reproductive life of the woman—that is, during the period of ovarian activity—that both hyperplasia and functional bleeding are found They disappear after the menopause, and may always be checked by removal of the ovaries Occasionally curetting, in cases of uterine bleeding occurring several months after apparent menopause, may yield a hyperplastic endometrium These cases are analogous to the not infrequent instances of pregnancy occurring after apparent menopause They are apparently to be explained by the fact that cessation of ovarian function is not actually complete Or, as Schroder [5] suggests, it is possible that the endocrine disturbance involves endocrine glands other than the ovary

4 Hyperplasia and the associated menstrual bleeding are not usually cured by curettage Observations on this point are still rather meager, owing to the fact that this endometrial condition has not as yet gained general recognition as a histologic entity The results

4 Driessen Zentralbl f Gynak 38 618 1914
5 Schroder Arch f Gynak 104 27 1915

of Schickele and Keller[6] are, however, of interest in this connection Of 111 curettages performed for uterine bleeding, thirty-eight were successful and sixty-one were failures Among the thirty-eight successful cases, there were only four (10 per cent) hyperplasias Of the sixty-one unsuccessful cases, nine (15 per cent) were hyperplasias Good results are too often taken for granted when curettage is performed for functional bleeding Most frequently this assumption is not borne out by the subsequent history of the patient Busse[7] found only 10 per cent of actual cures in 505 cases of curettage for uterine hemorrhage due to various causes He did not differentiate the cases of hyperplasia in his statistics, but there is no doubt that a great many were included, and that they would hardly show better results than the general average here quoted

5 When a hyperplastic endometrium is curetted away it is not replaced by a normal mucosa, but by a tissue similar to that removed This is demonstrated by the examination of sections from cases in which curettage has been repeated one or more times The deduction to be drawn from this fact is that the lesion is not a local one, as it is, for example, in cases of the postabortive type, in which curettage practically always brings about a cessation of the bleeding By curetting in cases of hyperplasia, on the other hand, we are attacking the disease at the wrong end, for we merely remove the endometrial manifestation of the underlying endocrine cause, which still remains operative

6 In a certain number of cases, curettage, especially if repeated a number of times, may result in cure In these cases it seems likely that either spontaneously or as a result of the operation there occurs a readjustment in the function of the ovary

7 Radium and the roentgen ray, which destroy the graafian follicles in the ovary, exert a most beneficial effect on the type of bleeding under consideration

8 Even if hyperplasia were a primary disease of the endometrium, it would be difficult to suggest any satisfactory explanation of the uterine bleeding that accompanies it By comparison, the hyperemia in cases of hyperplasia is certainly much less intense than in such conditions as acute endometritis, and yet, in the latter, menstruation is frequently normal, and may be absent altogether In other words, disease of the endometrium without involvement of the ovary is not characteristically associated with bleeding, while disease of the ovary, even though the endometrium be normal, is frequently associated with excessive menstruation

IS HYPERPLASIA A CONSTANT FINDING WITH FUNCTIONAL UTERINE HEMORRHAGE?

The question next arises as to whether all cases of functional hemorrhage are associated with hyperplasia of the endometrium This is not an easy matter to determine, as the clinical exclusion of anatomic causes is sometimes impossible For instance, hemorrhage supposedly functional may be due to a concealed uterine polyp, or to a small, unrecognized myoma, or to an early carcinoma, or to a low grade adnexal involvement Until a much larger number of cases is studied, therefore, we cannot be definite on this point The impression that I have gained, however, from the study of a rather large number of cases, is that unless hyperplasia is found on curetting, we should not be too quick to assume the functional nature of the bleeding

SUBSERVIENCY OF THE ENDOMETRIUM TO THE OVARY

The conception that pathologic alterations in the endometrium may be of ovarian origin is not by any means a new one Brennecke,[8] as far back as 1882 spoke of what he called "endometritis ovarialis" Somewhat similar ideas were suggested by Czempin, Gottschalk and Franz These observations were published before the epoch-making work of Hitschmann and Adler[9] on the menstrual histology of the endometrium, and there is no doubt that the endometrial

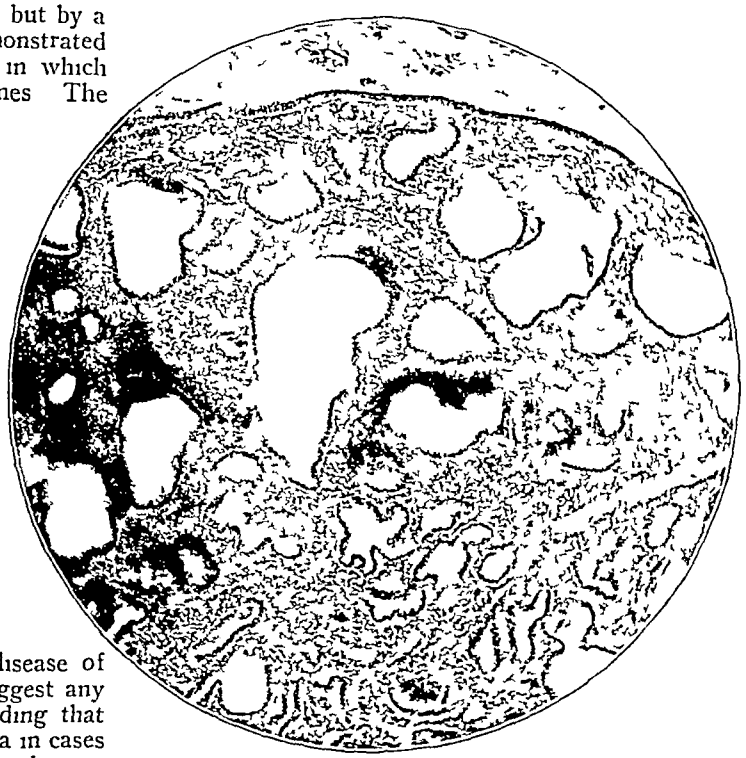

Fig 3.—Large glands immediately beneath surface Crowding of glands was perhaps due to large overgrowth of endometrium many drams of which were removed at curettage The patient a single woman of 18 had a history of almost continuous uterine bleeding for one year

changes that were described really represent various stages of the premenstrual hypertrophy normally exhibited by the uterine mucosa These earlier observations are of interest, however, in that they indicate a recognition of the habitual subserviency of the endometrium to the ovary Lauth[10] has shown that the injection of ovarian extracts may cause hyperemia and hemorrhage, together with definite changes in the endometrium and myometrium

The investigations of Schröder[5] are especially interesting in this connection in that they have to deal directly with the question of the ovarian etiology of

6 Schickele and Keller Arch f Gynak 95 586 600 1912
7 Busse Prakt Ergebn d Geburtsh u Gynak 2 376 1910

10 Lauth Monat chr f Geburt h u Gyn l 12 1 1 1

hyperplasia This author, from a study of fifty-four cases, concluded that the characteristic ovarian changes consist of a failure of follicular rupture, and a consequent absence of corpora lutea in these cases As the corpus luteum is believed to be essential to the premenstrual secretory stage normally exhibited by the endometrium, it is not surprising that this secretory stage is absent in cases of hyperplasia In other words, there is a persistence of the proliferative stage, which Schroder believes is due to the internal secretory activity of the follicles To put it another way, the development of the endometrium stops short of the secretory stage, the picture of hyperplasia representing merely a persistence and an exaggeration of the proliferative phase The conclusions of Schroder are of great interest, but they still lack confirmation

The injection experiments of Schickele [11] also throw an interesting light on the physiologic relation between the endometrium and the ovaries This investigator found that, generally speaking, the injection of extracts of the ovary exerts a more powerful inhibitory effect on the coagulation of blood than does the injection of uterine extracts If, however, the uterine extract is derived from a patient who has had excessive bleeding, it is found to be more potent than the ovarian extract in the inhibition of blood coagulation He suggests that the inhibitory substance is formed in the ovary and passed on to the uterus, and that the excessive menstrual bleeding may thus be due to the presence in the endometrium of excessive amounts of this coagulation-inhibiting substance A similar theory has been urged by Sturmdorf,[12] Goffe,[13] and others This explanation is only a variation of the point of view that I am urging, that a functional disturbance of the ovary is the responsible factor in the uterine bleeding of the so-called idiopathic type—the very cases in which, as already noted, we so frequently encounter hyperplasia of the endometrium

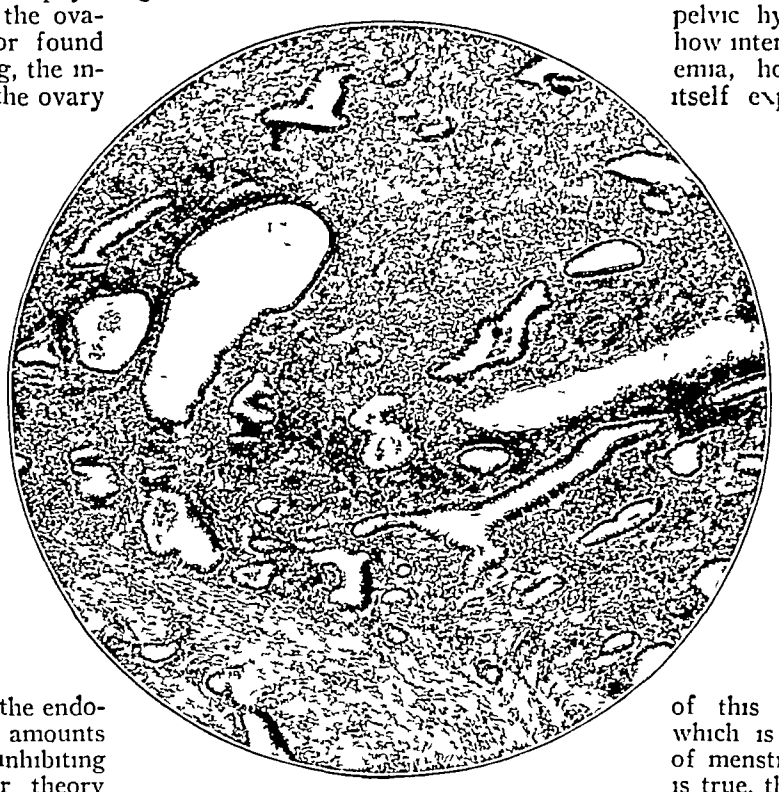

Fig 4.—Typical hyperplasia of endometrium in a case of adenomyoma of the uterus, the chief symptom of which was menorrhagia

THE NATURE OF THE ENDOCRINOPATHY

As yet it is not possible to state whether the ovarian disorder is in the nature of excessive or of diminished function Female hypogonadism is a frequent and well defined clinical entity, being well typified by the phenomena of the menopause, either natural or surgical Much less is known as to the opposite condition —female hypergonadism, or hyperoophorism It is surprising to note the looseness with which this term has been employed by various authors There is no convincing scientific evidence, for example, for ascribing precocious puberty to excessive secretion of the ovary, as has been done by various authors—there is, indeed, good evidence against this view The administration of ovarian extracts, even in human beings, has at times appeared to cause excessive menstruation but such observations are few and of rather doubtful significance

In the absence of any structural changes in the pelvic organs, it would seem logical to explain excessive menstruation as being due to excessive ovarian secretion In this connection it is worth while emphasizing a point frequently overlooked in the consideration of the physiology of normal menstruation, which, after all, should be taken as the point of departure in the study of menorrhagia It is generally stated that the ovarian secretion causes menstruation by inducing a pelvic hyperemia No matter how intense the grade of hyperemia, however, it cannot in itself explain the hemorrhage of normal menstruation No explanation indeed, is adequate unless we assume the presence in the endometrium of some local factor that makes the endometrial vessels much more permeable at the menstrual period than at other times It is possible that the same factor is responsible for the noncoagulability of menstrual blood From the work of Schickele and Keller,[6] it seems probable that the ovary is responsible for the presence in the endometrium of this physiologic principle, which is the immediate cause of menstrual bleeding If this is true, the occurrence of menorrhagia in cases of hyperplasia of the endometrium would point to the probability of an excessive functional activity on the part of the ovary

In this connection I have been struck with the frequency with which hyperplasia of the endometrium is found in connection with adenomyoma of the uterus (Fig 4) The latter condition represents what is, to all intents and purposes, a hyperplasia of the uterine musculature, just as hyperplasia of the endometrium represents a proliferation of the endometrial elements The interesting possibility suggests itself that perhaps both hyperplasia and adenomyoma may be due to the same underlying ovarian dyscrasia

THE OVARIAN ELEMENT THAT IS CONCERNED

It is not very satisfying, in the present state of our knowledge, to speculate as to the relative importance of the corpus luteum and the other ovarian elements in the production of hyperplasia Two apparently incongruous clinical factors have struck me as bearing on

11 Schickele, München med Wchnschr 58 123 1911
12 Sturmdorf New York State J Med 11 460 1911
13 Goffe New York M J 100 109 1914

this point First, the bleeding of hyperplasia is characteristically in the nature of menorrhagia, that is, the periodicity of menstruation is usually preserved This would suggest an influence on the part of the corpus luteum, which is preeminently the cyclic structure in the ovary Second, no matter at what period the endometrium is curetted in a case of hyperplasia, the histologic pattern is practically the same, although the degree of change may vary considerably, just as cases vary in the severity of their clinical symptoms In other words, the endometrium, in cases of hyperplasia, does not exhibit the characteristic cyclic changes seen normally at the various menstrual epochs This observation, in contrast to the one previously mentioned, would suggest that the corpus luteum influence is in abeyance When these two observations are explained and harmonized, the problem will be well advanced toward solution After all, little will be gained from any extended discussion of the etiology of hyperplasia until we know more concerning the nature and functions of the ovarian hormones—I use the plural number advisedly, for it seems certain that the ovary possesses more than one hormone

THE PRACTICAL LESSON TO BE DRAWN

Too many gynecologists are inclined to explain all cases of uterine hemorrhage on the basis of some definite structural disease in the pelvis, without taking into account the importance of pathologic physiology as a possible factor Menstruation is in itself a physiologic hemorrhage, and yet no one would maintain that it is due to the hypertrophic endometrium found just before its onset It is the ovarian secretion which is universally accepted as the ultimate cause of the phenomenon Why then speak of an important group of cases of uterine hemorrhage as caused by hyperplasia, or even by a "local biologic factor" in the endometrium, when both the hyperplasia and the "local factor" are merely manifestations of the same underlying cause—a disordered ovarian function?

SUMMARY

The cardinal points that have been elaborated in this paper may be thus set down

1 Functional uterine bleeding, occurring in the absence of any gross pelvic disease is very common at the menopause, when it often leads to the suspicion of malignancy It is next most frequently observed at or near the time of puberty, but it may occur at any age The bleeding is commonly of the type of menorrhagia, with not infrequently periods of amenorrhea

2 A frequent histologic finding in these cases is the condition that has been called hyperplasia of the endometrium This is characterized by an overgrowth of both the epithelial and stromal elements of the endometrium, with the production of a perfectly distinctive histologic pattern, which makes its recognition easy by means of the microscope

3 There are good reasons to believe as I have shown, that hyperplasia is not a primary disease of the endometrium, but that it is secondary to an endocrine disturbance of the ovary The exact nature of this functional disorder, and the precise histologic changes in the ovary which are associated with it, have not as yet been satisfactorily determined

4 The secondary nature of hyperplasia of the endometrium explains the failure of curettage to bring about permanent cessation of the menorrhagia observed in these cases This procedure merely attacks a local manifestation of the underlying cause—an endocrine disturbance involving the ovary

ABSTRACT OF DISCUSSION

DR LUCIUS E BURCH, Nashville Tenn Seventy-five per cent of cases of uterine bleeding are due to one of the five following conditions Cancer, abortion fibroid tumor, extrauterine pregnancy and the so-called endometritis that is associated with pelvic inflammation Hyperplasia of the endometrium is sometimes found associated with one or more of these conditions Functional bleeding occurs only during the period of sexual activity, and is not associated with any palpable or visible pathology either of the uterus or the appendages Dr Novak claims that it is due to an endocrine disturbance, and he uses the argument that is almost unanswerable that it is found only during the period of ovarian activity and that it is cured by the removal of the ovaries He does not, of course, advise the removal of the ovaries for the relief of this condition My own opinion coincides with his I trust the time is near at hand when the question of the endocrine system in relation to uterine bleeding and menstruation will be cleared up The curet does no good in this or in any other condition It is an instrument that should only be used for diagnostic purposes

DR HENRY P NEWMAN, San Diego, Calif What is your treatment of this condition?

DR. EMIL NOVAK Baltimore Dr Burch has very properly emphasized the limitations of curettage in cases of this type This procedure is usually indicated however, for purposes of diagnosis In patients at or near the menopausal age curettage should be performed in order to exclude the possibility of cancer As to the treatment of functional hemorrhage, we cannot as yet speak with any degree of finality Since the hemorrhage is of endocrine origin, the rational treatment would seem to be along the lines of organotherapy Unfortunately however, the results of this plan are not usually very striking In some cases, the thyroid extract appears to exert a beneficial effect. In a recent case of functional bleeding of three months' duration observed in a patient of twelve years, thyroid extract checked the bleeding almost immediately, although a previous curettage had been unsuccessful In most cases, however, the results of thyroid therapy are disappointing, and at times the bleeding seems to be made worse The administration of ovarian extracts, and especially of those derived from the corpus luteum at times also seems to be of value, although here again the results are anything but constant It would seem that the nature of the endocrinopathy varies in different cases Many gynecologists perform repeated curettage in these cases It is hard to explain the cures which occasionally follow this procedure except perhaps on the assumption that there has been some alteration of the ovarian function In the more stubborn cases the two measures which suggest themselves are radiotherapy and hysterectomy By means of the former it is possible to diminish the menstrual flow or to check it entirely if the latter object is desirable as in the case of women at the menopause In this latter group finally, hysterectomy is resorted to by some gynecologists for the reason that the ovaries and their secretion are left undisturbed

---

Influenza Prevalence in Newark by Age and Sex—Although the incidence in sexes has been practically evenly divided Spanish influenza has apparently shown a marked preference for certain age groups Among 27 161 cases recorded during September, October and November the age groupings have been unusual 12 940 were between 20 and 40 years 47 per cent In the ten-year age periods the highest prevalence was between 20 and 30 years 7 550 cases The ten year period 1 to 10 years had 4 741 cases and from 30 to 40 years 5,390 cases In five-year periods under 20 the highest prevalence was between 15 and 20 years, 3 309 cases—*Health Bulletin*, Newark N J

ROENTGENOGRAPHY AND TRANSILLUMINATION

COMPARATIVE VALUE IN DIAGNOSIS OF DISEASES OF THE FRONTAL AND MAXILLARY SINUSES AUTHOR'S METHOD OF TRANSILLUMINATION *

H H BRIGGS, M D
ASHEVILLE, N C

Roentgenography and transillumination offer valuable objective evidence of the condition of the superficial nasal accessory sinuses Which of the two is more valuable is debatable, depending on the anatomic relationship, the modus operandi, and on how much the observer has studied the various methods of each while comparing his diagnosis with his surgical findings The one method supplements, frequently corroborates, and occasionally refutes the findings of the other If they did more they would together form the sine qua non of sinus diagnosis, and their findings would be pathognomonic If taken jointly, and in connection with other symptoms and signs they often prove to be determining factors in establishing a diagnosis, and frequently suggest the proper therapeutic procedure

All agree that the roentgenogram better outlines the sinus, and offers definite limits to guide the operator It alone furnishes positive evidence of absence of a frontal sinus, the shadow of which by transillumination might indicate an infected sinus On the other hand, the rays making the plate must pass through the head, the greater part of which is foreign to the parts we wish roentgenographed Consequently there may be in the plate misleading shadows caused by many parts within the cranium posterior to the sinuses On the other hand, the translucency of a sinus is little interferred with by extraneous parts except by slight variations of thickness in the bony walls and overlying soft tissues Transillumination requires less skill, and is quickly and inexpensively done by the clinician himself, while the roentgenogram, correctly made is the product of a rather highly specialized, and, therefore, expensive technician, requiring careful interpretation by either the technician or, preferably, the clinician It is just as essential for every clinician to be able to interpret the roentgenogram—although he may not have made it—as it is for him to perceive the translucency of the sinus by the electric light Every sinus plate reveals details to the interpreter which no one can fully describe to him, and to operate from another's findings is like striking where some one points

ROENTGENOGRAPHY

It is not intended to describe here the technic of making sinus plates other than to discuss the two usual positions of exposure, namely, the nose-chin and nose-forehead positions of the plate, and to describe the special advantage of each in exposing the frontal and maxillary sinuses In either position the axis of the tube should be parallel with the plate, and the principal rays should pass through the special part to be roentgenographed at right angles to the plate Authorities agree [1] that a soft tube with intensifying screen and a moderate amount of milliamperage are best adapted for the deep penetration and detail demanded in sinus roentgenography For the sake of correct detail, the part to be exposed should be placed as close to the plate as possible At the same time, consideration must be given to the density of the tissues through which the rays must pass before entering the sinus which is to be roentgenographed, and to fulfil these conditions the position approximating the nose-chin position of the plate is most admirably adapted for the maxillary sinus The base of the skull offers two prominences of bone of considerable resistance namely, the lesser wings of the sphenoid, and to a much greater degree the petrous portions of the temporals It is, therefore, desirable to select a position that will allow the projection of these parts to fall on the plate outside the projection of the sinus which is to be roentgenographed

In the nose-chin position the projection of the lesser wings of the sphenoid bisects the orbits horizontally, and they are seen as narrow curved lines passing outward and upward through the orbit, and the petrous portions are superimposed on the upper incisors, and, therefore, just below the shadow of the antrum The exact position of the plate with reference to the nose and chin depends on the type of face In the average physiognomy the tip of the nose should be about 1 cm from the plate, a person with a prominent nose and receding chin should rest with the nose on the plate, or perhaps pressed deeply against the latter, while the opposite type of dish-face may require the nose lifted 1 or 2 cm from the plate In the nose-chin position, rays passing through the maxillary sinus first pass through the middle fossa of the skull above the petrous processes of the temporal, and below the lesser wings of the sphenoid Projected within the shadow of the maxillary sinus, and near the nasal wall, may frequently be seen the foramina, affording exit for the optic and the three divisions of the fifth nerves, especially the foramina rotunda, and ovalia lying more latterly, and being the more easily outlined in the normal sinus

The nose-forehead position is ill suited for the maxillary sinus, as in it the petrous processes are projected across the antrum often with such density of shadow as completely to obscure the details, mislead the interpreter, and simulate a pathologic condition of the sinuses This position is perhaps the better routine method for the frontal sinus, especially if an exact outline of the upper limits of the sinus is desired, and provided that the principal rays are directed from a position sufficiently forward to bring the lesser wings of the sphenoid below the superciliary ridge It is not so well adapted for the outline of the orbital extensions of the frontals and the anterior ethmoid cells as is the nose-chin position, because of the shadows of the lesser wings of the sphenoid, and the base of the anterior fossa

TRANSILLUMINATION

The value of transillumination depends on the interference which the pathologic contents and thickened mucosa of a diseased sinus offers to transmitted light A perceptible interference to light is shown by uncontaminated mucus, and more by normal mucous membrane, and when the latter becomes swollen and hyperemic, and the sinus filled with mucopus and detritus, especially in chronic infection, a high degree of illumination becomes necessary for translucency

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orlean April 1920

1 Waters and Waldron Am J Roentgenol 7 633 (Feb) 1915

Since we are concerned with the light interference caused by the diseased processes in the sinus cavity alone, it is highly important that the light, before entering and after passing out of the cavity, should encounter as little interference from extraneous bone and soft tissue as possible, and to this end I wish to describe a method of transilluminating the maxillary sinus which I have used with gratifying results for eleven years, namely an orbitopalatobuccal route of transillumination The advantages claimed over the palatofacial, or Heryng method are

1 The light passes through less extraneous (to the sinus) tissue

2 It passes through opposite instead of adjacent sides of the sinus, and, therefore, penetrates deeper into the cavity

3 It takes less time

4 It is more cleanly

AUTHOR'S METHOD

The patient is placed on a high stool in a dark room, and is requested to tilt the head backward and open the mouth The cheek is retracted with a tongue depressor so as to bring into view not only the hard palate, but also that part of the floor of the antrum in the buccal cavity outside and above the molars

The light is placed against the lower lid above the infra-orbital notch, pushed inward, and pointed downward until the infra-orbital ridge is well passed, when an area of pink will be seen on that part of the roof of the mouth and buccal wall on either side of the alveolar process corresponding to the floor of the antrum

That the extraneous tissues in this orbitopalatobuccal method are less extensive and offer less resistance to the light than in the Heryng method is evident after comparing the thickness of the antral walls in the valuable data given by Davis [2] "The orbital wall is a thin plate of bone from 0 5 to 1 5 mm , and the facial from 2 to 5 mm in thickness," or from three to four times as thick as the orbital wall Thus the light passes through only one third as much bone and far less soft tissue in entering the antrum through the orbit in the author's method, as it does in its exist from the antrum through the facial wall in the Heryng method In each case the light passes through the roof of the mouth In the new method there is the added advantage of being able to observe the translucency outside and above the molars, as well as in the roof of the mouth, in fact the entire floor of the sinus where pathologic conditions are most usually found is outlined and transilluminated

ROUTE OF TRANSMITTED LIGHT THROUGH ANTRUM

The popular fallacy in the palatofacial method of Heryng is the presumption that the light passes directly through the antrum As a matter of fact the greater part passes first through the floor of the nostril into the nasal cavity, and then through the lateral nasal wall into the antrum and through the upper inner and interior corner of the antrum, escaping entirely any localized pathologic condition of the sinus lying over the roots of the teeth and outer antral wall, which is the most frequent site of a pathologic condition, especially when the infection is of dental origin Apropos of this, Logan Turner [3] says

With the exception of a very small portion of the outer edge of the palatal plate of the superior maxilla close to the alveolar margin the roof of the mouth forms the floor of the nose, and has no part in the formation of the floor of the antrum, this wall being formed by the alveolar process which bears the teeth The typical floor is over the molars and the posterior portion of the second premolar and in all stages of development is in close relation to the teeth there being always a bony covering over their roots

A further quotation from Turner will help to remind one how far, laterally, the inferior fossæ of the nose extend

> In an antrum of average dimensions the outer border of the latter [canine] ridge indicates externally the line of union between the facial and nasal walls of the cavity When the lamp is placed in the mouth some of the luminous rays enter the maxillary sinus directly, while the remainder pass into the nasal cavities and thus reach the antra through their nasal walls

It is very evident, therefore, that when (as frequently happens) a septal spur or an enlarged inferior turbinate or some other abnormal condition fills the inferior fossa, transillumination by the old method is very materially interfered with, and its interpretation rendered faulty

73 Haywood Street

ABSTRACT OF DISCUSSION

DR JOSEPH C BECK Chicago Dr Briggs demonstrated to me and others the method of transillumination he described One thing in favor of this method is the anatomic reason given for getting the proper transillumination through the antrum direct For the frontal sinus this light is splendid It is the only one I have seen that is worth anything at all in the diagnosis of frontal sinus lesions In reference to the use of the roentgen ray in the diagnosis of sinus disease or disease of the antrum of Highmore, I am not ready to accept his statement That the plates show a density across the antrum is due to the fact that the horizontal plate of the frontal bone is too high It is true that the malar bones are shown somewhat encroaching on the antrum but when making a plate for all the sinuses you do get the lower portion of the antrum better in the posterior anterior position and that is the part where we are looking for trouble because the upper part of the antrum is usually masked by the anterior ethmoid cells

DR HENRY C BRIGGS Asheville N C In trying out the many positions for the plate in sinus roentgenography, the one approximating the nose-chin position offered the fewest disadvantages and the most advantages In almost any position there are certain perplexing shadows of normal parts projected on the plate and the most pronounced of these I found to be the petrous portions of the temporal bones and the greater wings of the sphenoid as demonstrated by the slides showing the wires placed over these structures in the skull The nose-chin position allows the projections of these dense shadows to fall one above and the other below the antrum, and the shadows of the greater wings of the sphenoid falling across the orbits do not interfere with the projection of the frontals In this position the outlines of the frontals are well projected and what is equally desirable it shows the orbital extensions of the frontals as will no other position—a matter of great importance to the operator especially in the radical operation

INDIFFERENCE OF THE LARYNGOLOGIST TOWARD TUBERCULOUS LARYNGITIS

AND THE TUBERCULOSIS PROBLEM *

WILLIAM V MULLIN, M D
COLORADO SPRINGS, COLO

No one, I am sure, will deny that tuberculosis is a medical problem of great importance It would only be necessary to look over the history of tuberculosis in the United States Army in order to confirm this statement While immunity and resistance influence the prognosis of this disease, by far the greatest aid in the solution of this difficult problem is early diagnosis What are we as laryngologists doing to assist in this solution? Are we aiding in the early diagnosis and giving the proper advice to the persons affected?

Laënnec,[1] in 1819, first described the formation of ulcers in the larynx, due to the breaking down of little tubercles, Louis, in 1825, laid stress on the direct action of sputum from phthisical lungs as a cause of tuberculosis of the larynx, and also stated that the posterior wall was the most often affected, Trousseau and Belloc, in 1837, differentiated cancerous, syphilitic and tuberculous ulcerations, but prior to this date they had all been grouped as laryngeal phthisis, Rheiner,[2] in 1853, stated that the predilection of the disease for certain parts might be due to the delicacy of the epithelium in such situations And yet the principle of the laryngoscope was not discovered until 1854, thirty-five years after Laennec first described the condition of laryngeal tuberculous ulcerations Krause, in 1885, introduced treatment by lactic acid, and Heryng, in 1887, demonstrated a case healed by the use of curets and lactic acid These facts make us realize how little has been added to the early observations by later laryngologists

As to the frequency of tuberculous laryngitis in persons having pulmonary tuberculosis, statistics vary all the way from 5 to 85 per cent This discrepancy is doubtless due to lack of uniformity in arriving at the diagnosis It is my own belief that the higher figure is the one nearer the truth, and that tuberculous laryngitis is a more frequent complication than is generally supposed The diagnosis of incipient laryngeal tuberculosis is not an easy matter As St Clair Thomson so well puts it, diagnosis depends on the "skilled eye of the diagnostician" This eye might be compared to the trained ear of the chest man, and it can be acquired only by the examination of a great number of larynges in all stages After such well known pictures as pear-shaped swelling of the arytenoids and typical tuberculous ulcerations, the diagnosis is not difficult Meyer,[3] in his histologic examination of the larynx of tuberculosis patients, in whom no laryngeal changes were observed during life, was able to demonstrate histologically tuberculosis in the laryngeal tissues in five out of six of such cases Von Ruck, in a series of 309 cases, found laryngeal tuberculosis present by inspection in 182, or 58 per cent, and he determined by focal reaction that eighty-four other larynges were affected, bringing the total to 86 per cent, or 28 per cent additional

All due credit should be given to such writers as Wright and Smith, Phillips, Lake Lockard, Kloebs, and many others, yet the literature of this disease is scanty in proportion to, and in comparison with, the literature of other diseases Think, for instance, of the exhaustive works on the blood, on surgery of special parts, and on malignancy, as compared with what has been written on tuberculous laryngitis A few years ago the rhinologists combined their efforts and carried on an investigation of ozena At this meeting we are to have the report of the committee on local anesthesia Can we not in some way have similar joint work on laryngeal tuberculosis? Consider how infrequently the larynx is removed and studied at necropsy, and what a limited amount of histopathologic work has been done on this structure I myself never get over my astonishment at the difference between the appearance of the larynx when viewed postmortem as compared with the image seen in either the direct or the indirect laryngoscope And in making this comparison, I am impressed with the fact that the disease is always more extensive than that which can really be seen in the laryngeal mirror I think no other disease of the larynx is comparable to tuberculosis in this fact, that the image will vary so at different examinations, and that it is difficult to write down just what one sees

What is lacking among laryngologists that should have provoked the title of this paper? One thing is this, that they do not take a more active interest in this disease Some laryngologists have told me that they see very little tuberculous laryngitis in their part of the country, but this means only that they are not making the diagnosis Some are afraid of becoming infected themselves while examining or treating this condition Other men have told me that they do not care to treat this disease, but prefer to send the patients to a sanatorium

ATTITUDE OF SANATORIUMS

Let us see what the situation is at our sanatoriums throughout the country A questionnaire was sent to all the tuberculosis sanatoriums listed in the directory published by the National Association for the Study and Prevention of Tuberculosis To the question, "Do you accept cases, if known, of laryngeal tuberculosis at your institution?" 21 per cent answered, "No" To the question, "Do you have a trained laryngologist in attendance?" 61 per cent answered in the negative To the third question, "Are all your cases given a systematic routine examination of the ear, nose and larynx on admission, and at certain stated intervals during their residence?" 35 per cent replied that they did not, and some volunteered the information that they had this examination made only when symptoms demanded it To the last question, "Is this examination made by a laryngologist, or by the regular chest man in attendance?" 26 per cent answered that they were made by a laryngologist, and 74 per cent that they were made by the chest man Some of the additional replies to this question were amusing, and I will give one example "I can see no reason why a trained laryngologist should be in a tuberculous sanatorium The attending

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 This brief review of the early history of tuberculous laryngitis is taken from Lake R Laryngeal Phthisis or Consumption of the Throat London 1901

3 Meyer A Beitrage zur Pathologie der Larynx Tuberculose Virchows Arch f path Anat 165 498 503 1901

physician gets an immense amount of experience covering this kind of work and is as well fitted to treat these cases as a laryngologist"

My deductions derived from the answers to these questions are as follows The sanatoriums constituting the 21 per cent which do not admit known cases of laryngeal tuberculosis are adding to the number of patients (already too large) who are endeavoring to seek recovery from tuberculosis of the throat by going to the private office of the physician or to the free dispensaries, whereas, if they are to gain any results at all, they should be in bed carrying out the absolute rest cure We do not leave the diagnosis and treatment of our ear cases, sinus conditions, or other diseases of the larynx, to a general man, so why leave to him laryngeal tuberculosis? In a series of cases of laryngeal tuberculosis studied by Dworetzky,[4] 35 per cent either had no symptoms referable to the larynx, or else these were very slight and could be easily attributed to other causes The influence of diseased conditions of the upper respiratory tract on the larynx is too well known for comment, except to add that in tuberculous patients (the majority of them in bed and with high temperature), the greatest care should be taken to rule out and prevent every irritation from above, thereby greatly lessening cough and preventing complications

As for the 74 per cent of sanatoriums in which patients are not examined by a competent laryngologist, I fear that in these institutions the chances for making a diagnosis of early infiltrations in the larynx are greatly lessened If we wish a conception of the magnitude of the problem in the country as a whole, we must add to the patients in these sanatoriums the great unknown number without competent examination scattered throughout the country Dworetzky classified his cases in a way that I like very much, namely, acute, subacute and chronic, and I think that more effort should be made to do this when making a diagnosis Casselberry, writing some years ago, spoke of the resistant and nonresistant types

At Farmingdale, N J, there is a tuberculosis preventorium This institution cares for the children of tuberculous parents By competent and routine examination of all cases of tuberculosis, a certain number might be put in a "preventorium class," where tuberculous patients with frequent attacks of acute and catarrhal laryngitis would be watched more closely and warned and advised regarding future possibilities Some may question this procedure on the grounds of insufficient time, but on the other hand, think of the amount of time consumed, with so little reward, in treating one advanced case of laryngeal tuberculosis with perhaps painful deglutition, and then think what the result would be if the same amount of time were given to a number of incipient cases

I believe that the men doing tuberculosis work are looking to the laryngologists for some definite ideas on this disease, and I do not believe that we are giving them the aid they should have In a reprint entitled, "Standards for Diagnosis, Classification and Treatment of Tuberculosis in Children and Adults," prepared for the Framingham community health and tuberculosis demonstration, all the diagnostic points in regard to the chest are well covered, but the only advice relative to the throat is "Any hoarseness or persistent huskiness requires investigation" This is good advice, but it is not enough Fishberg says that in his experience local treatment is not often effective in enhancing cicatrization of laryngeal lesions and that when carried out vigorously it is liable to do harm Farther on in the same chapter, he says that there is one form of the disease in which unlimited use of the voice is advisable, and that is where only the cords are affected He then reproduces an illustration of a very advanced and distorted tuberculous larynx I wonder whether most laryngologists dealing with tuberculosis will not agree with me that local treatment is effective, and I certainly believe that we should be able to judge and standardize our treatment in such a way that it would not be so vigorous as to cause damage I am convinced that, without some modification, the statement in a textbook recommending unlimited use of the voice in laryngeal tuberculosis tends to create dangerous notions, and hence harmful practices

CONCLUSIONS

1 A more active interest in tuberculosis should be taken by laryngologists

2 There should be more thorough and uniform teaching of the diagnosis of this disease, and it should be carried on in such a way that the student will have opportunity to examine large numbers of incipient cases, and to see these repeatedly and thus familiarize himself with the laryngeal image seen in tuberculosis as compared with that found in other allied conditions

3 I hope that a committee of laryngologists representing the various laryngologic societies may be formed to meet with a committee from the National Association for the Study and Prevention of Tuberculosis for the purpose of standardizing the literature and teaching of this subject, and with the further object of stimulating clinical investigations and pathologic research concerning this condition

ABSTRACT OF DISCUSSION

DR JOHN B MCMURRAY, Washington Pa I had the larynx removed postmortem from a series of cases in fifty of which or 60 per cent the diagnosis was made antemortem, 20 per cent showed gross pathologic lesions at the time of necropsy, and 20 per cent did not show any lesions at all at necropsy As Dr Mullin stated, in all the cases in which the diagnosis was made antemortem we were surprised at the extent of the lesion found postmortem compared with the description of the case antemortem Every one of the ten cases which did not show lesions at necropsy were found to be tuberculous on microscopic examination These lesions were practically all situated in the posterior wall and lateralward from the ventricle. Just what the early signs are has not been settled definitely There must be some reaction of the tissues to the early invasion of the infection Meyer in his work on experimental tuberculosis showed that there was a certain amount of edema or swelling of the mucosa We had a series of cases last year in which there was a submucosal edema of the posterior wall of the larynx.

Believing that it might be possible to make a diagnosis of beginning tuberculous laryngitis with the roentgen ray we began a series of experiments first with taking known cases of tuberculous laryngitis We made stereoscopic plates In every case we were able to show densities on the plate corresponding to the lesions in the [illegible]tion of the epiglottis or other structures was [illegible]nchnical

4 Dworetzky Julius The Diagnosis of Tuberculous Laryngitis J A M A 69 619 623 (Aug 25) 1917

5 Fishberg Maurice Pulmonary Tuberculosis Philadelphia & Febiger 1916 chapter on laryngeal

types, cases that do not show lesions visible with the laryngoscope, densities appeared that we believed were tuberculous We cannot prove that, however, as we could not get the larynges from these cases for microscopic examination Two difficulties are encountered in this work One is the difficulty of getting a good position The position we found most satisfactory was to put the target of the instrument midway between the anterior and posterior walls and take the first picture with the instrument thirty millimeters upward and the second with the instrument sixty millimeters down from this central point Dr Mullin emphasized the fact that we should try to get these cases early Unquestionably, in any case of pulmonary tuberculosis in which there is positive sputum, there is danger of involvement of the larynx I believe in direct infection of the larynx The larynx should be examined frequently and carefully One never knows when these cases will begin to ulcerate Put the patient under preventive treatment early to avoid the distress and pain that accompany advanced cases of tuberculous laryngitis

DR JOSEPH A STUCKY, Lexington, Ky In the last six months I have been much surprised to find that in every case in which there was any ear trouble, whether a catarrhal or a suppurative condition, or when there was pharyngeal or tonsil disease, or anything that lowered the resistance of the patient, there were marked results from the removal of the cause and rapid improvement in the pulmonary condition I have been surprised at the number of cases of ear trouble and beginning laryngeal trouble with no symptoms until attention was directed to them These conditions were found by making careful, complete examinations in each case on admission I believe we are liable to do harm by using the average local treatment, a direct spray in the larynx, when there is a tickling cough Local treatment should be as nonirritating as possible Of course, when there is broken down tissue and painful deglutition we have another problem and efforts should be made to relieve this as rapidly as possible by topical applications

DR THOMAS E CARMODY Denver Those of us who live in the West have seen many of these cases The sanatoriums are taking care of them In U S Army General Hospital No 21 we examined probably 3 000 men Of the known cases of tuberculosis of the lungs laryngeal involvement was present in 95 per cent There has been a difference of opinion among laryngologists as to what constitutes tuberculous laryngitis Many cases of tuberculous laryngitis are not diagnosed clinically Lake's work has proved this also Lockard's As to the fear of infection if we accept the present ideas regarding tuberculosis, there is none for we all have had tuberculosis in some form—probably healed before we became laryngologists Dr Mullin spoke of submucosal edema I have seen it for years and am glad to have a name for it The cases I have seen postmortem prove that the involvement of the larynx was much higher than we expected from the physical examination We treat late stages mostly but I agree with Dr Mullin that we should devote our efforts to the early stages and the prevention of ulceration We cannot prevent tuberculous laryngitis, but we can prevent the breaking down of the tissues The roentgen ray is of great value in diagnosis

DR CULLEN F WELTY, San Francisco I agree with Dr Stucky I saw a case in which there was extensive ethmoid suppuration on both sides The patient was supposed to be tuberculous, but she gained twenty pounds after the ethmoid suppuration was cured Nothing has been said about what to do with this larynx How are you going to take care of a tuberculous infection in the larynx of a patient who has fever with no chance of recovery, with great difficulty in swallowing and coughing all the time? Nothing has been said about injecting the superior laryngeal nerve with alcohol or about resecting it I can recommend these procedures most highly Then there is another class of patients, those that are quiet, the lung condition is quiet, no temperature elevation at all We operate to cure such patients Remove the tissue and curet the bone These are the patients that get well Laryngitis patients do not get well without operation Sprays and such things in the larynx are of no consequence whatsoever, except, possibly, in a palliative way

DR C H MCCASKEY, Indianapolis There is just one way to treat a patient with tuberculous laryngitis Put the patient to bed and keep him or her quiet Relative to the painful cases, it is all right to inject the superior laryngeal nerve, but that causes pain There is a better way described by Blumental of Berlin, which is to resect a portion of the superior laryngeal nerve, and the patient is happy

DR WILLIAM V MULLIN, Colorado Springs, Colo There is nothing in my paper on the treatment of tuberculous laryngitis, therefore I will not reply to any of the discussion regarding treatment Dr McMurray is an example of a type of laryngologist who is living in a community in which he is not supposed to see much tuberculous laryngitis, yet who is seeing it all the time The roentgen ray is not of value in cases in which there is manifest tuberculous laryngitis But try it in the cases with tuberculosis elsewhere in the body and in which you do not find anything in the larynx on laryngoscopic examination In the service we roentgenographed a great number of detachment men who were supposedly healthy, and in those we found no densities in the larynx Then we roentgenographed a number of men who had pulmonary tuberculosis who were raising sputum but without manifest findings in the laryngeal mirror We found these shadows and felt they must be tuberculous Repeated attacks of laryngitis in the tuberculous occur commonly I believe this is a flare-up of tuberculous deposits well down in the tissues which are not seen by the laryngeal examination Dr Stucky emphasized an important point of clearing up other infection of the upper respiratory tract I agree with him that too vigorous applications may do harm Most of our medication outside of operative procedure, is carried on by using an intratracheal syringe

SOAPS IN RELATION TO THEIR USE FOR HAND WASHING*

JOHN F NORTON, PH D
CHICAGO

The public is asked to buy many things of a fraudulent nature, or concerning which fraudulent claims are made by the manufacturers or their agents We are all familiar with the history of foods in the last twenty years and the great advance that has occurred since the passage of the Food and Drugs Act in 1906, in protecting the gullible public This law and various amendments made an attempt to regulate a far greater evil than adulterated foods, i e, the ubiquitous patent medicines At the present time a manufacturer must not make "false or misleading" statements concerning the composition of his medicine and must not make curative claims which are "false or fraudulent", but this applies only to the package in which the medicine is sold and not to circulars or newspaper advertisements apart from the package He must also declare the presence and amount of eleven specified drugs Closely allied to the "patent medicines" are the varieties of "healing," "antiseptic" and "germicidal" soaps, accompanied too often with claims of their value which to my mind have been neither proved nor disproved I will cite two instances from the soaps with which we have been working for the last two years

1 "May be used as a general antiseptic for wound cleansing, for washing sores, ulcers, *including cancerous infections* [italics in these quotations are mine]

Useful for offensive odors about the body, *for bathing in contagion* and for many diseases of the skin"

2 "*Chemical* tests have shown that bacteria and germ life exist on ordinary soap, but that no germ life and bacteria can exist on Not only will the soap itself remain sterile but when rubbed over the body *in the usual manner of washing the skin is rendered sterile,* thus acting as a safeguard"

TABLE 1—ORGANISMS FOUND BY CUMMING

Number	Condition	Organisms	Per Cent Positive
340	Carrier	Streptococcus hemolyticus	37
40	Patients	Pneumococcus	15
95	Patients	B diphtheriae	6
	Carriers	Streptococcus viridans	100
78	Patients	B tuberculosis	2

Other soaps are frankly advertised as antiseptic or germicidal, and many certainly convey to the buyer the impression that they are excellent means of killing the harmful germs which may be present on the skin when the soaps are used, as in the claim just quoted, "in the usual manner of washing"

There are several features connected with buying and using soaps One is perhaps more economic than hygienic, i e, should the public be asked to pay 30 or 35 cents for a special kind of soap unless it really possesses properties which make it more valuable than those selling for 12 or 7 cents? But far more important are the specific hygienic claims made for certain soaps Are they frauds or do they really possess, for example, germicidal properties which really aid in the prevention of the spread of disease? Can the public depend on them or do they foster a false sense of security? It is certainly important to examine the basis on which these claims are made Let us take, for example, the bactericidal properties Whatever variety of tests have been made in the manufacturers' laboratories, for the buyer there is only one guide the statement which is sometimes on the package concerning the phenol coefficient" value I think it may be admitted that soap solutions in *sufficient concentration* are antiseptic (not necessarily germicidal) In addition, many soaps contain such substances as cresols, which are known to be bactericides under the proper conditions Hamilton [1] has stated that "no soap can be considered an effective disinfectant unless associated with some other more active agent" But this statement is thus qualified later in the same article "Most disinfectants with the exception of potassium mercuric iodid add little to the efficiency of soap" referring to disinfecting properties Is the "phenol coefficient" a proper means of measuring the value of soaps when used" in the usual manner of washing"? I think not, because of the great difference in conditions which exist in the laboratory tests and in the actual use of the soaps We have no adequate tests and, indeed, a search of the literature reveals that almost no attempts at such tests have been made

First, let us consider the necessity for removing bacteria from the surface of the body and particularly from the hands Various considerations point to such a necessity and to the hands as vehicles in the transmission of infectious diseases Transference of typhoid and paratyphoid bacilli from patients, convalescents and carriers to food can most easily be conceived as taking place by way of the hands Material from the nose, as in colds, or from the mouth, as in diphtheria (or with diphtheria carriers), may be taken from the hands and conveyed to the hands of others either directly or by means of such objects as door handles or dishes or books, and thence will reach the mouth of a normal person and may infect him Cumming [2] believes that the major part of the transmission of respiratory diseases is due to hand infection His conclusions are drawn from such data as these Of groups comprising more than 66,000 officers and men in the army, about half washed their mess-kits in tepid water in barrels, the common property of each organization The other half used table ware Among the first group the influenza rate was 252 per thousand, in the second group only 51 1 per thousand These results are explained by Cumming as due to the conveyance of the virus to the tepid water by the hands, the germs then being picked up on the hands of another individual and hence passing to the mouth either directly or indirectly In another study [3] on the incidence of pneumonia in institutions, it was found that this incidence was three times as high where hand-washed eating utensils were used than in those in which there were machine washers Whether or not the interpretation of these results is wholly correct, the figures certainly serve to indicate the importance of the hands as a possible means of transmitting disease

If the hands are so important, it ought to be possible to find on them pathogenic bacteria or associated organisms Many studies have been made on the flora of the skin, but most of them were concerned with normal forms as staphylococci, rather than with those foreign organisms which are temporarily present on the outer surface and would be most easily removed In attempting to establish experimentally the possibility of typhoid infection by way of the hands, Winslow,[4] more than fifteen years ago, made a search for *B coli* on the hands of 111 individuals

TABLE 2—RESULTS REPORTED BY WEAVER

patients and carriers who were not masked Some years ago, Cummins[8] reported the isolation of typhoid bacilli from the hands of carriers Since not all of the organisms mentioned in these experiments can be regarded as part of the normal flora of the hands, and were obtained by swabbing (Weaver) or washing in sterile water (Winslow), it is easy to see that with sufficient care of the hands, conveyance of infection could doubtless be decreased This care, of course, consists mainly in adequate hand washing

It is of some importance, therefore, to know the value of various soaps in removing bacteria, in the

TABLE 3—BACTERIA REMOVED FROM THE HANDS

Soap	Number of Tests	Wash Water	First Rinse Water	Second Rinse Water	Total

* This series contained one very high count

destruction of bacteria removed and in killing any bacteria remaining on the hands It seems to us that this could best be done by studies on hands as we found them rather than by artificially added foreign organisms The literature of soaps is enormous From a bacterial standpoint, the disinfecting properties of soap are of particular interest, but nearly all reports found deal either with the chemical constituents of soaps or with determinations of germicidal value of soap solutions according to methods comparable to those used in determining the phenol coefficient,[9] which, as has already been pointed out, are not done under conditions similar to those of actual hand washing The only experiments of the latter kind are those reported in 1899 by Symes[10] He tried the usual tests on cultures of bacteria in suspension, and concluded that "for practical purposes most of the so-called disinfectant soaps have no value, but in the combination of biniodid of mercury with soap we have a useful means of disinfecting hands, instruments, etc" Symes also tried hand washing experiments, but did not succeed in sterilizing the hands by this method even with mercuric iodid soap No details of these experiments are given

In our experiments we have tried to determine four things First, the relative efficiency of various soaps in removing bacteria from the hands For this a standard procedure was devised and a large number of tests were made, since the comparison of results from single instances not made in any uniform way would be valueless Second, the relative germicidal power of the soap solutions obtained in washing toward bacteria removed from the hands Third, the bacterial condition of the hands after washing, i e, whether sterile or not Fourth, the effect of the soap, if any, remaining on the hands, comparing the action of different soaps in this respect.

In the experiments we used in all twelve soaps, varying from the cheapest toilet soaps to the expensive so-called antiseptic and germicidal soaps These were picked at random from those on sale at retail drug stores The experiments were made during various seasons of the year on students and members of the staff of the laboratory who were called from their regular work without previous warning No seasonal differences were noted In all the work the hands were washed in sterile distilled water at 40 C in sterile pans The number of bacteria was determined by plating on nutrient agar (reaction + 1 to phenolphthalein), and the plates were counted after twenty-four hours' incubation at 37 C In order to work out some standard procedure, a long series of preliminary experiments was made in which conditions and numbers of washings and rinsings were varied For example, it was found that wiping the hands on a sterile towel between washing and rinsing or between two rinsings resulted in an increased removal of bacteria in the final rinse The use of a towel was therefore abandoned Tests were also made to determine the maximum number of bacteria which could be removed by successive washings and rinsings This number varied from 24,000 to 7,000,000 in six tests with six successive washings and rinsings The average number of bacteria found in the last rinse water was 232,000—in one case 745,000 We can therefore conclude that it is impossible to obtain sterile hands in the ordinary process of washing These results were confirmed by later work, done, however, for a somewhat different purpose The procedure finally adopted was as follows Hands are washed by the subject for one minute with soap in 500 c c of sterile distilled water at 40 C in a sterile pan According to trials, the time, one minute, is rather longer than is customarily spent in washing The hands are immediately rinsed in sterile distilled water under the same conditions, and this rinsing is repeated The wash water and rinse waters are then immediately plated to determine their bacterial content Table 3 gives the average total bacteria removed from the hands according to the foregoing procedure The variation in the number of bacteria in the different

TABLE 4—BACTERIAL COUNTS

Number	Original Wash	1 Hour	3 Hours	5 Hours
1	1 380 000	2 460 000	1 360 000	1 385 000
2	179 000	143 000	136 000	137 000

10	23 000	17 500	56 000	19 000

tests was tremendous In one series of twelve tests with the same soap, the lowest number obtained in the wash water was 60,000, and the highest, 8,445,000

Of these eight soaps, A and B are well known toilet soaps, D is a green soap such as is used in hospitals, and the others are special soaps supposed to have particular powers with respect to killing bacteria The ordinary toilet soaps appear to have removed the greatest number of bacteria in the wash water, although the differences are not so marked in the rinse waters and totals There are two explanations One is that the special soaps have killed the bacteria or at least inhibited their growth so that they do not appear on the plates, and the other is that the ordinary toilet soaps actually have a greater cleansing power

8 Cummins cited by Richardson Bull State Board of Health of Massachusetts 3 129 1914

9 Work of this kind is reported by Konradi Arch f Hyg 44 101 112, 1902 Rodet Compt rend Soc de biol 63 264 266 1905 Rasp Ztschr f Hyg u Infektionskrankh 58 45 63, 1907

10 Symes Bristol M & Chir J 17 193 197 1899

It is certain that, with the soaps we used, a good lather is more easily obtained with the latter It appears also that the larger number of bacteria in the first rinse water from the special soaps, in comparison with the number obtained in the wash water, might be explained by the difference in cleansing power, and leads us to doubt the germicidal action However, these points needed further investigation

The possible disinfecting or antiseptic properties of the special soaps were tested in two ways The first method consisted in allowing the wash water to stand protected and the bacterial content determined after varying periods of time This ought to give an indication as to the germicidal action of these soap solutions toward the bacteria found on the hands Table

TABLE 5—GROWTH AFTER INCREASED INCUBATION

	24 Hour Incubation	48 Hour Incubation
Wash water	0	19 ,00
Rinse water	0	24 500

4 gives the bacterial counts as obtained from the original wash water and after this has stood for one, three and five hours Experiments 1 to 5 are with ordinary toilet soaps, Experiments 6 to 10, with special soaps Experiments 6 and 7 are with the same soap These results show that for practical purposes the germicidal and antiseptic powers of the special soaps as well as of ordinary toilet soaps, in solutions as obtained in hand washing, are too small to be of any use With two soaps containing mercuric iodid (probably potassium mercuric iodid, as this is the soluble compound), we were unable to obtain growths on our plates in twenty-four hours in all instances, either from the wash water immediately after use or after long standing If the agar plates were allowed to incubate for forty-eight hours, growth was invariably obtained These soaps apparently exhibited, particularly the one containing the larger amount of mercuric iodid, some germicidal and certainly marked antiseptic properties An instance of growth after increased incubation is given in Table 5 The concentration of soap in the agar plates carried over from the wash water was about 0 05 per cent, in those from the rinse water about 0 001 per cent This would mean that with 2 per cent of mercuric iodid in the soap, 0 002 per cent of mercuric iodid was sufficient to retard bacterial growth

That the soap solutions may fairly be compared was shown by determinations of the amount of soap actually used in washing, which, although different persons and different soaps were used, gave figures within reasonably narrow limits The amount of soap in solution was determined by titrating with standard acid and reading from a plot the amount of soap corresponding to the titer The plots were made by weighing out various quantities of the soap as bought, dissolving in water and titrating Straight lines (within the limits tested) were obtained in every case, but the slope of the line varied with the kind of soap The amount of soap used in hand washing under the conditions previously described varied in twelve tests between 2 and 5 1 gm, averaging 2 8 gm This corresponds to a concentration of 0 5 per cent

But in washing, the hands not only come in contact with the soap solution but also are rubbed with lather in which the concentration of soap is much greater Furthermore, a small amount of the soap or its ingredients may be left on the hands In order to get the effect of these factors, the hands were allowed to dry for five minutes after washing and were then rinsed in running sterilized distilled water, and the number of bacteria washed off was determined This was done with a series of ten soaps all of which were supposed to possess antiseptic or germicidal qualities In Table 6 the first column gives the bacterial content of the first rinse water from a series of experiments done as previously described i e, the hands were rinsed immediately after washing The second column gives the figures from a series in which the hands were allowed to dry five minutes before rinsing

These figures demonstrate that the soap remaining on the hands after washing has no germicidal action The difference in the average figures is well within the limits of error of the work

In this connection the amount of soap in the rinse water was determined as an index of the amount of soap left on the hands after washing This proved to be about 2 per cent of the amount of soap actually used or, on the average, 0 05 gm

The same difficulty in obtaining growths of bacteria with soaps containing mercuric iodid was observed in these experiments as in the previous ones, and such growths (except in one instance) were obtained only after forty-eight hours' incubation These soaps again exhibited distinct inhibitive properties

CONCLUSIONS

Sterile hands are not obtained in the ordinary process of hand washing More bacteria were found to be removed by the ordinary toilet soaps than by the special soaps In other words, the cleansing properties of a soap are more important than its "germicidal" or "antiseptic" constituents

The soap solutions obtained in hand washing are of no practical germicidal or antiseptic value

TABLE 6—BACTERIAL CONTENT WITH RINSE WATER AFTER DRYING

	Without Drying	After Drying

		2 000
		3 000 000
Average	421 000	4 000

* The figures standing oppo ite in the columns have no significance

The soap left on the hands after washing has no germicidal action

In the whole process of hand washing done in the usual manner the special so-called 'germicidal" or "antiseptic soaps exhibit none of these properties Therefore these terms are not proper to use in connection with soaps

Finally since the hands may serve as a medium for the conveyance of bacteria in infectious diseases, it is important to remove these bacteria, and this may be done by the ordinary toilet soaps as effectively if not more so, as by the special brands of so called antiseptic" or germicidal ' soaps

END-RESULT STUDY OF HALLUX VALGUS OPERATIONS

A REPORT OF NINETY SIX CASES AT THE ORTHOPEDIC CLINIC OF MASSACHUSETTS GENERAL HOSPITAL SINCE 1905

HOMER WALDO SPIERS, AB, MD
LOS ANGELES

Operative attempt to relieve the pain and disability accompanying hallux valgus is far from a new procedure Removal of the exostosis, dissection of the bursa, tenotomy and transplantation of the tendons, removal of the sesamoids, partial and complete removal of the head of the metatarsal, and removal of the proximal end of the proximal phalanx, together with numerous combinations of the foregoing, have all been advocated and practiced The influence of such men as the Mayos and J B Murphy being thrown on the side of complete excision of the head, the simplicity of it and the fairly satisfactory results that followed have made this method the most frequent one of choice

One of the many noteworthy lessons that the experience of the Medical Corps of the Army has brought forth is that the present operations in vogue for the relief of this disabling condition did not put the man back in the ranks in a reasonable time prepared to do his full share as a soldier He was still partially disabled after many weeks of convalescence The result was not satisfactory, therefore, to the person who must depend largely on his feet for his livelihood It was with these facts in mind that I undertook the investigation of a series of cases in which operation was performed at the Massachusetts General Hospital over a period of fourteen years

RESULTS

	Cases
Complete excision of the head of the metatarsal	78
Removal of the exostosis only	8
Kellar method	7
Wedge shaped osteotomy	1
Miscellaneous	2
	Years
Average time since operation	4
Average age of patients at operation	36
Youngest	15
Oldest	62
	Per Cent
Satisfied (of the whole series)	64
Dissatisfied (of the whole series)	36
Dissatisfied whose after treatment was unsatisfactory	56
Examiner's report satisfactory	57
Examiner's report unsatisfactory	43

Of the ninety-six patients who answered the questionnaire, sixty-four were examined either by me or by members of the staff of the orthopedic outpatient department The type of the operation was obtained from the case record, the patient's opinion of the results, his postoperative treatment, shoes, plates, etc, and his occupation were secured from the questionnaire The examiner obtained the cosmetic and functional result from the local examination A result was considered satisfactory if the patient could pursue his usual occupation with little or no discomfort It was, of course, unsatisfactory if the accustomed occupation gave foot distress or the condition of the feet necessitated a change of means of livelihood

There were seventy-eight operations classified as excision of the metatarsal head, of these, 61 per cent were satisfactory and the remainder unsatisfactory Of the latter group, 56 per cent had unsatisfactory after-treatment Of this group whose results were not satisfactory, it was found that 70 per cent were compelled to follow occupations that required much standing and walking, working as waiters, policemen, cooks and mechanics and the like Concerning after-treatment, those patients were considered to have had sufficient after-treatment whose feet were properly shod, plated and observed for a reasonable length of time, two or three months The complaints were largely painful transverse arch (metatarsalgia), partial or complete ankylosis, deformity, or a combination of the three The ones who were displeased with the result, with remarkable regularity, expressed themselves, "Since operation my trouble has not been the same It has been different"

There were eight operations performed by removal of the exostosis only Seventy-five per cent were wholly unsatisfactory Two patients expressed themselves as partially satisfied In the seven operations by the Kellar method, all the patients reported satisfaction and the examinations were uniformly good

This end-result study, analyzed as a whole, shows favorable results in about two thirds of the cases There is most surely room for improvement One ought to be able to give a favorable prognosis in better than two out of three of his cases Undoubtedly in private practice a higher percentage of good results is obtained

Complete excision of the head of the metatarsal bone was by far the largest group studied What are the factors that militate against an ideal surgical end-result and lead to disability in this class of cases? First, I think, stands the loss of the foundation of the weight-bearing pillars of the transverse arch of the foot The anterior arch was the trouble maker, metatarsalgia and painful plantar callosities were the most frequent sources of trouble A percentage of these could probably have been avoided by proper long continued after-treatment Correct shoes and properly fitting plates would have helped The latter require a great deal of adjustment, and in the long run are not ideal The longitudinal or posterior arch was less frequently a cause for complaint Secondly, partial ankylosis was the rule in nearly all the unhappy results If the ankylosis was complete, and particularly if the toe was in the cock-up position, the result was most distressing With the loss of joint function and the attendant loss of muscular control came difficulty in propulsion This accounted for some of the painful results Lastly, there was another class of cases in which the roentgen ray had probably revealed the cause of disability The tendency to spur formation at the end of excised bone is well known If this occurs on a weight-bearing surface, we have an evident cause for trouble If it seems reasonable and good surgical judgement to handle with great care the stump in larger bones, where weight bearing is to be anticipated, it surely is important to consider this a source of possible trouble, in the removal of such weight-bearing pillars as the metatarsal heads From the appearance of the roentgenograms, it would seem that this detail has been somewhat neglected It should be added to the thorough technic of excision, in my opinion

The second group of operations, that of removal of the exostosis only, with or without the so-called bursa, need not occupy our attention long The post-

REPORT OF CASE

W, a soldier, was evacuated to the Belgian military hospital Villiers-le-Sec (Calvados), a base hospital attached to the field hospital of Beveren-sur-Yser, with a wound of the abdomen in a convalescent stage The clinical history revealed that a month before he had been admitted to the hospital of Beveren, where he had been operated on by Dr Derache for a penetrating shell wound of the right lobe of the liver with laceration of the lower part of the liver The fragment was buried in the parenchyma of the liver, this was extracted, the liver was sutured and packed with a tampon of iodoform gauze, and the wound was closed The postoperative course was normal, the tampon was removed on the sixth day, and the soldier was evacuated after three weeks in a fair way to recovery On his entry into the base hospital, his condition was very satisfactory Local examination disclosed a cicatrice about 12 cm long, along the external border of the great right lobe, in the center of which there was a discharging fistula, the discharge was blood stained The dressings were renewed every other day, and each time blood was detected on the gauze Eight days after admission to the base hospital there was a slight hemorrhage, more abundant than usual, from the fistula, but no importance was attached to the occurrence Several days later a profuse hemorrhage saturated the dressing, and the soldier called this to the attention of the physician on duty The latter applied a tampon in the fistula On the succeeding days there was relative calm the dressings were always stained with blood The hemorrhage apparently occurred with greater frequency, and as retention of a shell fragment in the liver was suspected, a roentgenogram was made, with negative result As the symptoms continued, the tract was explored with a stylet, on the theory that it concealed some foreign body not opaque to the roentgen ray Nothing was accomplished except renewal of the hemorrhage, which could be arrested only by a tampon The bleeding continued and the general condition of the patient grew worse One month after admission a blood count revealed 3,800,000 red cells, and the patient was almost colorless, the mucous membranes were pale A second count ten days later, gave 3,200,000 red cells and hemoglobin 60 per cent The patient felt weak The discharge from the fistula was always bloody, and never contained clots It did not seem that hemophilia could be at the bottom of the trouble, as the patient had undergone a major operation without postoperative hemorrhage From the median vein of the arm a sample (2 c c) of blood was taken in order to compare the coagulation time with that for a normal person Morawitz's method being used, a difference of one minute was noted, not characteristic of hemophilia The same was noticed in comparing the bleeding time with that for normal subjects Bleeding after puncture of the ear lobule continued for some moments and stopped as quickly as in the normal subject As the symptoms became aggravated it was decided to undertake homohemotherapy as recommended by Sicard This simple procedure is not in the nature of a transfusion It consists simply in taking blood from a healthy subject, about 100 or 150 c c being obtained from a vein of the arm The blood is aspirated into a syringe and is immediately injected under the skin of the patient at some point where the skin is fairly loose, as over the abdominal region In the case here reported, the injection was repeated after eight days A local hematoma formed, but was resorbed in ten days On the day following each injection the temperature rose very slightly (38 2 C and 37 9 C) but no other general symptom developed On the contrary, there was local improvement After ten days the discharge from the fistula had diminished considerably, and by the fifteenth day the fistula had dried up and the operation scar completely healed One month later the general condition of the patient was normal, and all signs of anemia had disappeared

COMMENT

It would be rash to call this condition acquired hemophilia, because there was no incoagulability of the blood Nevertheless, there is in this term an element of truth, for it was really a local hemophilia, strictly limited to the region of the wound This hemophilia in the liver region kept the fistula open by the incessant hemorrhages which it provoked On the basis of the few observations made on this wounded soldier, it is not possible to do more than formulate some hypotheses It is necessary, first of all, to bear in mind one physiologic fact When the general circulation of a dog is restricted by excluding the intestinal and hepatic areas, the blood becomes incoagulable Moreover, in Nolf's theory of blood coagulation, one of the three colloids necessary for coagulation, the thrombozyme, comes from the blood vessel walls The others, fibrinogen and thrombogen, are formed in the liver In the case under consideration, did not the wound of the liver alter the hepatic tissue in this definite respect, that the parenchymatous portion no longer produced the colloids indispensable to coagulation? Hence the frequent hemorrhages and the persistent bloody discharge from the wound

There is, moreover, nothing very new in this hypothesis We need only recall that diseases of the liver often give rise to profuse hemorrhage, clinicians have noted the frequency of hemorrhage in cirrhosis, while it is only necessary to mention hemolytic jaundice and that disease which was so prevalent during the war, spirochetal jaundice The treatment employed was enough to induce rapid recovery by changing slightly the humoral equilibrium of the patient Because of its simplicity and absolute harmlessness, the method deserves the attention of physicians Much more simple than transfusion, the technic can be used under any and all circumstances The indications are obviously more restricted than those for transfusion, which retains its value for acute cases, and they are not definitely determined in all anemic conditions and hemorrhagic dyscrasias homohemotherapy apparently exerts a favorable influence

The foregoing case is reported mainly from an essentially practical point of view The facility with which homohemotherapy may be practiced gives it almost universal application Without preliminary equipment or surgical preparation of any sort, with only a good syringe sterilized by boiling, any physician can make subcutaneous injection of human blood, provided only that he is certain of the health of the donor From this point alone, homohemotherapy has an undeniably practical advantage over transfusion There need be no fear either of anaphylaxis or of producing embolism and infarct, as in transfusion of other than citrated blood There is no more danger than with an injection of serum, and it would seem that injection of whole blood has proved much more efficacious

---

Sanitation and Antityphoid Vaccination—The protective value of antityphoid vaccination is no longer open to question No more definite test could possibly have been given than that afforded by the recent war emergency, a test by millions No better comparison was ever offered than the comparison between the awful typhoid mortality in our troops in the Spanish-American War, and the light incidence of typhoid in the far greater war from which we have just emerged, triumphant over noxious germs as well as noxious Germans War observation has taught us that vaccination is not a substitute for sanitary precautions It has demonstrated the possibility that men fully and properly vaccinated may yet succumb to typhoid invasion The probable explanation is that in such cases the victim is overwhelmed by infective material in enormous doses—*Bull Kansas Bd Health*, March, 1920

Clinical Notes, Suggestions, and New Instruments

A CASE OF VAGINAL SEPTUM AND BICORNATE UTERUS *

H G STEELE M D BLUEFIELD W VA

About 11 30 p m, March 7, 1920 I was called to see Mrs C E N, who had been wasting for thirteen days She was 18 years of age, and had been married since October, 1919 I found her in bed suffering with slight pains and wasting a little with evidence of having considerable uterine hemorrhage since 3 p m that day Examination revealed a bloody discharge in and about the vaginal orifice This was mopped away and the area made reasonably sterile with pledgets of cotton saturated with compound solution of cresol On attempting to insert two fingers into the vagina I encountered an obstruction a short distance from the entrance and found that only one finger could be introduced as far as the cervix without some unpleasantness to the patient This caused me to wonder how it was possible for this woman to become pregnant through so small an opening On withdrawing my finger and reinserting it into the vagina I found more room than before sufficient for the insertion of two fingers, and did insert two fingers up to the cervix On closer examination I found what appeared to me to be two vaginas leading up to two cervices, or a double cervix uteri, with an orifice opening into each vagina This partition in the vagina was attached to the anterior and posterior walls, and it seemed to be joined to a septum of the cervices The uterus was slightly enlarged

The patient gave a history of having missed two previous menstrual periods I packed the vaginas—the right with two pledgets of gauze, the left with one—after stretching both slightly I gave the patient a hypodermic injection of morphin sulphate, ¼ grain, and atropin sulphate, 1/150 grain, at 12 o clock, and left her for the night

At noon the next day she was brought to the Mountain View Hospital and put to bed At 1 30 that afternoon the gauze was removed On the gauze from the right side there was a bloody discharge, but none on the one from the left leading me to believe that there were two distinct openings in the cervix and a complete septum in the middle of the vagina

She slept most of the afternoon and was resting comfortably when I left the hospital at 10 o'clock that night At 1 30 the next morning the night nurse called me over the phone and said that she was having a hemorrhage A hypodermic injection of morphin sulphate, ¼ grain and atropin sulphate, 1/150 grain was ordered She rested well the remainder of the night, and the hemorrhage almost ceased

At 10 30 a m, March 9 she was put on the operating table and an anesthetic given The septum was put on the stretch and was found to be 6 cm long and 3 cm wide or the latter was the distance from the anterior to the posterior wall of the vagina when well dilated and this septum was from 3 to 5 mm thick

The cervix was pulled down with volsella until it could be seen in the left vaginal fornix The cervix was dilated and the uterus curetted with the index finger and then with a dull curet the remains of a placenta of about one and one half or two months being removed from the right side of the uterus On further examination an opening about 1 5 cm from the external os was found leading into the fundus on the left side of the uterus for a distance of about 6 cm, while the depth of the right or pregnant side was about 10 cm proving that I was dealing with a bicornate uterus At this period of the operation I discovered that the upper border of the septum was not attached to the uterus and that there was but one cervix or possibly I had converted two cervices into one, at the time of dilatation

The right cornu was mopped out with a strip of gauze saturated with equal parts of tincture of iodin and alcohol

The septum was clamped at the junction of the posterior and anterior vaginal walls and cut away between the clamps The stumps of the septum and the vaginal walls were painted with the iodin-alcohol solution and the vagina packed with a strip of gauze

The right side of this septum was covered with a smooth soft cartilaginous tissue while the left side was covered with convoluted vaginal mucous membrane

The clamps were left on the stumps of the septum gauze was wrapped around the handles and the patient put to bed At 7 40 p m that day the clamps were removed No bleeding followed At 8 20 500 c c of urine was withdrawn by catheterization The gauze was removed the next day

The patient did not seem to have any other deformity except a ptosis of the right eyelid She never had more than very little vision in this eye She made an uneventful recovery and left the hospital March 15 April 23 she was feeling well

PETROLATUM IN ANTERIOR CHAMBER FOLLOWING CATARACT EXTRACTION

ARTHUR WHITMIRE M D NEW ORLEANS

REPORT OF CASES

CASE 1.—*Following combined* cataract extraction the lids were covered with sterile petrolatum dressed and bandaged For several weeks following a round mass apparently lens substance of about 4 mm always assuming the highest level or angle of the anterior chamber was noticed and the eye developed low-grade iridocyclitis without the least absorption of the mass I happened to pass the patient on the porch one morning stopped to make an inspection the sun happened to be shining into the eye and to my great astonishment the spherical globule of petrolatum was unmistakably shown in its natural color I assisted the oculist in charge in its removal, by entering a keratome above when the petrolatum was floated on the blade and inspected The patient passed from under my observation but not until we had noticed a great improvement

CASE 2.—As in the foregoing case seen at the same clinic a patient presented iridocyclitis Petrolatum was suspected and demonstrated by inspection in sunlight The patient left without operation and was not seen again

COMMENT

Petrolatum in the anterior chamber will by artificial focal illumination look exactly like lens matter having no greenish-yellow color The appearance would never lead one to think of petrolatum In cases with sluggish absorption of lens matter, following cataract I advise sunlight inspection

A SIMPLE AND EFFICIENT MEANS OF APPLYING RADIUM TO BLADDER NEOPLASMS IN THE MALE

GIDEON TIMBERLAKE M D BALTIMORE

Some years ago Young devised a most efficient and trustworthy instrument for procuring tissue from bladder tumors for section and diagnosis The value of this instrument became greatly enhanced when it was found that it could be applied effectively to intravesical operations which ordinarily would call for some major operation to accomplish similar results The removal of tissue has served as a minor function as compared with the removal of foreign bodies including small calculi In fact after lithotripsy there are fragments of stone to be removed which cannot be evacuated by natural or artificial means yet which are too small and isolated to be within easy reach of a blind instrument like the lithotrite This instrument the cystoscopic rongeur actually accomplishes a vast deal more than would ordinarily be expected of it because of its versatility and adaptability to rather intricate problems which are soon made easy of solution

The application of radium to neopla[illegible]ble blad[illegible]der is more or less simple and to [illegible]

simple in the male, but because of the anatomic difference in matter of approach, it has been found necessary to devise rather complex apparatus to meet the requirements, and when done, there is always a great element of risk attending, because of discomfort to patients, which causes them to shift positions without the instrument following In fact, while excellent by comparison with less well appointed means, the work is done in the dark, and therefore it is uncertain

While I was working with Dr William Neill at the Kelly Sanatorium, the application of radium in the end of a cystoscopic sheath or metal catheter end impressed me as being rather clumsy and uncertain In contemplating the more "refined" methods of approach and application, these, too, seemed to have their weak points As we were requested to take a piece of a special tumor for diagnostic purposes, it occurred to me to try the cystoscopic rongeur as a means of holding a radium capsule and applying it It was found that a capsule was held snugly between the jaws of this instrument, and we were able to pass in an ampule containing a decigram of radium after this fashion, and to remove the obturator and replace it with the cystoscopic sheath and turn the nose of the rongeur to whatever part of the tumor we desired

It was necessary, of course, to hold the jaws of the instrument together lest we lose the parcel The bystanders naturally entertained some fear lest this slip out and be lost within the bladder It must be remembered, though, that removal of this capsule with the rongeur would be most simple, provided it did not fall into a diverticulum or hiding fold of the bladder In thinking this over, a simple means of security presented itself namely, using a pulley 'belt hook" to slip over the thumb and finger posts, which would hold the jaws well in place

After the instrument has been properly adjusted to the tumor mass, the cystoscope is removed and replaced by the obturator for the purpose of holding the fluid in the bladder If leakage has taken place or it is necessary to make further observation, the irrigating chuck-nozzle which fits into the tunnel of the instrument can be put in place and the bladder cleansed and filled with clear fluid, when further observations may be made with the cystoscope It is obvious that this method is short of completion, but it most certainly brings the solution of the problem to being more nearly accurate

Fortunately regardless of the position of the tumor mass, it can be approached with reasonable accuracy by this method, then, too, it permits of intensive or lighter radiation at each sitting, thus intensifying the treatment, and it minimizes the amount of discomfort of the patient, since the time of application is greatly lessened

What use may be made of this suggestion, or what impetus may be given to devising more efficient methods, is problematic, but I have recommended it because it is obvious that it has some merit

816 St Paul Street

A NEW METHOD OF PREPARING WAX BULB CATHETERS OR BOUGIES FOR USE THROUGH ANY OPERATING CYSTOSCOPE

T M DAVIS M D GREENVILLE S C

In the diagnosis and treatment of ureteral strictures in female patients I used beeswax with more or less success for the bulbs on the ureteral catheters, introducing them into the ureter by means of the Kelly cystoscope But several attempts to pass these beeswax bulb catheters into the ureter through a Brown-Berger operating cystoscope were unsuccessful The wax was always cut or scraped off in the passage through the instrument

After trying several substances I found that sealing wax was a suitable substance for making these bulbs Although the forming of a suitable bulb with it is somewhat more difficult, it more than repays for the trouble in its durable qualities, as there is no injury to the bulb in its passage through the operating cystoscope The bulb is not scratched by a stone, to determine the presence of which it is necessary to tip the catheter with beeswax before introduction

In applying the sealing wax to a catheter I generally use an olive tip size 6 or 7 French ureteral catheter, one with preferably two eyelets Usually one has on hand several of these catheters with some damage to the proximal eyelet These can be used, as the wax repairs the eyelet A wire stylet is passed into the distal eyelet past the second eyelet to preserve the lumen of the catheter The wax is placed at the site of the proximal eyelet, or about three-quarters inch from the end of the catheter The sealing wax is heated in a flame and applied directly to the catheter (which must be dry) This is repeated as often as necessary, until the desired amount of wax is on the catheter, which is shaped into the form of an olive with some heated metal (as the end of a scalpel), and completed with the blade of the knife by gently scraping until the desired shape is obtained For diagnosis I usually prepare a bulb 4 mm in diameter, as this will pass easily through the cystoscopes and will give very satisfactory results A small wire stylet in the catheter is employed to give sufficient resistance against undue bending of the catheter

Having used this method in both male and female cases I can say that it is much more comfortable for female patients than is the use of the Kelly cystoscope as formerly

CHRONIC TOTAL INVERSION OF THE UTERUS

VIGGO W JENSEN ST LOUIS
Intern St Louis City Hospital

This case is reported because the condition is unusual, it was apparently of long duration, the gynecologic symptoms were of late onset, and the patient had been treated for 'nervousness"

Mrs R M, aged 43 complained of pain in the abdomen which was sharp and lancinating, beginning March 4, 1919, persisting, and becoming progressively worse It arose in the left lower quadrant, and then crossed to the right lower quadrant, where it may arise though this is less common

The patient, who had been married three times, had one child during the first marriage, twenty-three years before, and had not been pregnant since Menstruation was regular up to and after marriage The duration was about four days of twenty-eight day type Since March 4 1919, the day on which the third husband was killed, it has been coming on every two weeks with an increase in the number of napkins Prior to this date she had no idea of how long she had had a watery discharge, but after the foregoing date the discharge became red and continued so There was no leukorrhea

For about two years she had had attacks of dizziness, with black spots before her eyes at times other than at menstruation and also progressive loss of appetite and constipation She had for years had difficulty in walking upstairs or working hard, because she 'got out of wind," and occasionally when lying down, she had choking spells and then had to sit up in order to sleep

The patient was well nourished The skin had a yellowish tint There was increased cardiac dulness to the left, with systolic murmurs at the base and apex The abdomen showed tenderness in the iliac fossae, and the lower margin of the liver was just palpable There was slight edema of both lower extremities

Vaginal examination revealed the vagina filled with a spherical tumor, the size of a goose egg, fairly hard, of uniform consistency, with a smooth surface, and easily followed up to the vaginal fornix A cervical ridge could be made out in the right posterior quadrant, where a finger could dip into a shallow cavity, probably not more than one-half inch deep

Above the symphysis, no distinct mass could be palpated In the speculum, the vaginal mass appeared covered by a soft, grayish membrane, which only in certain portions higher up bled easily on being rubbed Nothing was visible to suggest a tubal opening A diagnosis of total chronic inversion of the uterus was made

The uterus was removed by the Spenelli method and the clinical diagnosis confirmed The length of the uterus from

the internal os to the fundus was 5 cm , the circumference here was 12 cm , about 9 cm at a point corresponding to the internal os

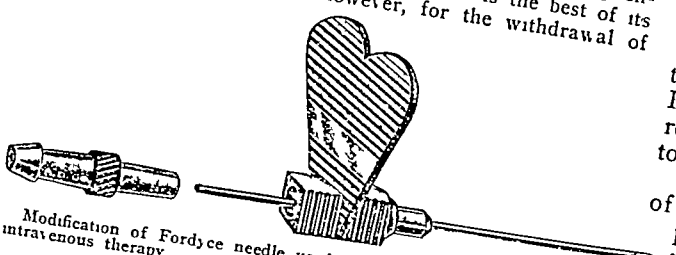
The mucosa was about 2 mm thick, very red shading toward the internal os into a pale pink, streaked with capillaries but the surface was intact except for surgical destruction and was movable on the underlying tissue From the peritoneal side the fundus appeared as a mass, there was no cavity here and portions of the tubes and ligaments had been dragged into this mass with the cervical arteries, in their relative position somewhat sclerotic. The cervical ring was obliterated The tubes were patent from the peritoneal side but not from the mucosal The surfaces made by cutting rolled out oozing with a watery fluid, they were smooth and appeared made up of minute strands The histologic exam ination revealed normal mucosa and muscle of the uterus

This inversion was probably of twenty years' standing as the patient stated that at the birth of her only child she had uterine inertia which was overcome by drug stimulation, she was delivered with forceps followed by unconsciousness for one day She was about the house on the third day and ten days later walked a half mile She was told by her physician that she would never bear another child because something else beside the afterbirth came away Since then she had had intermittent urinary disturbance pain over her lower abdomen and passing of liver-like clots on excessive inter- course

MODIFICATION OF FORDYCE NEEDLE USED FOR THE COLLECTION OF BLOOD AND FOR INTRAVENOUS THERAPY

E W ABRAMOWITZ M D NEW YORK

The Fordyce needle used for the administration of arsphenamin is of 19 gage and in my experience is the best of its kind When one uses it however, for the withdrawal of



Modification of Fordyce needle used for collection of blood and for intravenous therapy

blood, unless a syringe is attached the blood spreads out over the parts and causes soiling of the fingers, recep'acles, linen etc

I have devised a modification of this needle consisting of a stem through the hub beyond the holder of one piece at the same time not changing the socket of the holder thus making it possible for the original Luer adapter to fit around the needle The administration of arsphenamin can be proceeded with without puncturing the patient again The needle can be procured from James T Dougherty 409-413 West Fifty-Ninth Street, New York.

DIRECTIONS FOR USING THE NEEDLE

After skin sterilization a tourniquet is applied and the needle inserted into the vein A stream of blood passes inside the receptacle and one can collect 50 c c. of blood in a few minutes in this way when necessary as for intraspinal or autoserum work The tourniquet should be loosened before the gravity apparatus is attached to the needle, thus giving a comparatively clean field for operation

46 West Eighty-Third Street

Swat the Fly—Fly prevention can be accomplished only through efforts of the entire community working as a unit Competent authorities have estimated that the product of a single fly in forty days would equal 810 pounds provided one half of the offspring survived

OBSERVATIONS ON SOUTH AMERICA

I JAMAICA AND CANAL ZONE

WILLIAM J MAYO M D
ROCHESTER MINN

To the vision, courage and political sagacity of Theodore Roosevelt the world owes the Panama Canal The severing of the land connection between North and South America united the peoples of the two continents, and now that the war is over, trade and travel between North and South America will grow in an unprecedented manner The ease with which either coast of South America may be reached from North America is still scarcely appreciated by the people of either continent The trip from New York to Lima, Peru, can be made in very comfortable steamers in eleven days, and to Valparaiso, Chile, in fifteen days New and faster steamers are being put on which will readily reduce the time four days It will soon be possible to make the journey from New York to Rio Janeiro in less than two weeks, and to Montevideo and Buenos Aires in from fourteen to sixteen days Because of the many stops made by some of the steamers, the time is lengthened, but the interest to the traveler is enhanced by the opportunity given for visiting the West Indies, the Canal Zone and the coast cities A most delightful route is by way of the Panama Canal and the west coast, with various stops, to Valparaiso, Chile, then across by the Transandean Railway to Buenos Aires and Montevideo, and the return by the east coast via Rio Janeiro and other towns of Brazil

In January and February of this year I visited some of the countries and cities of South America for the purpose of observing superficially it is true, the methods of education and university organization and more in detail the medical schools, hospitals and research institutions I wished particularly to see and profit by attendance on the surgical clinics of the eminent surgeons of these countries I intend briefly to describe a few of the many interesting phases of our trip with the hope of stimulating others to take similar trips, not alone for the purpose of travel and recreation, but for the profitable study of the medical conditions of our Latin-American neighbors A brief review of the historical and geographic background may give a better understanding of the relations between the two continents (Fig 1) In 1492, Columbus landed on San Salvador, one of the Bahama Islands In 1497, the Cabots reached the mainland of North America There is evidence to show that Leif Ericson made a temporary settlement in North America about the year 1000 A D In 1498, Columbus landed on the mainland of South America near the mouth of the Orinoco River, and on his last trip in 1502, he visited the shores of Panama It is interesting to note that in the next fifty years the Spanish conquest of Mexico, Central America and South America was about completed The original people were Indians, and on this Indian stock the Spanish conquerors grafted Brazil is Portuguese, the country was discovered by Cabral of Lisbon in 1500

The native Indians of South America varied in degree of civilization and in characteristics In Mexico,

Peru and Bolivia they reached a high stage of civilization of a certain type The Araucanian Indians of the southwestern part of South America were much more warlike, a brave and hardy race, whose characteristics are still manifest in the Chileans Generally speaking, the South American natives were a superior type of Indian, and when they mixed with the white race many of the good characteristics of both races were retained There seems to be an impression in North America that there is a mixture of the negro in the people of South America It should be remembered that the negroes are to be found in the southern half of the United States and in the West Indies, that they are of an alien race brought over from Africa, and that there has been less mixture of the Africans with the Indians of South America than with the whites of North America Negro and negro mixtures have been little in evidence in Peru, Chile, Argentina and Uruguay The peoples of South America who have Indian blood are proud of their ancestry, as are the descendants of Pocahontas and John Rolfe North Americans have frequently given great offense to the South Americans by failure to recognize this fact

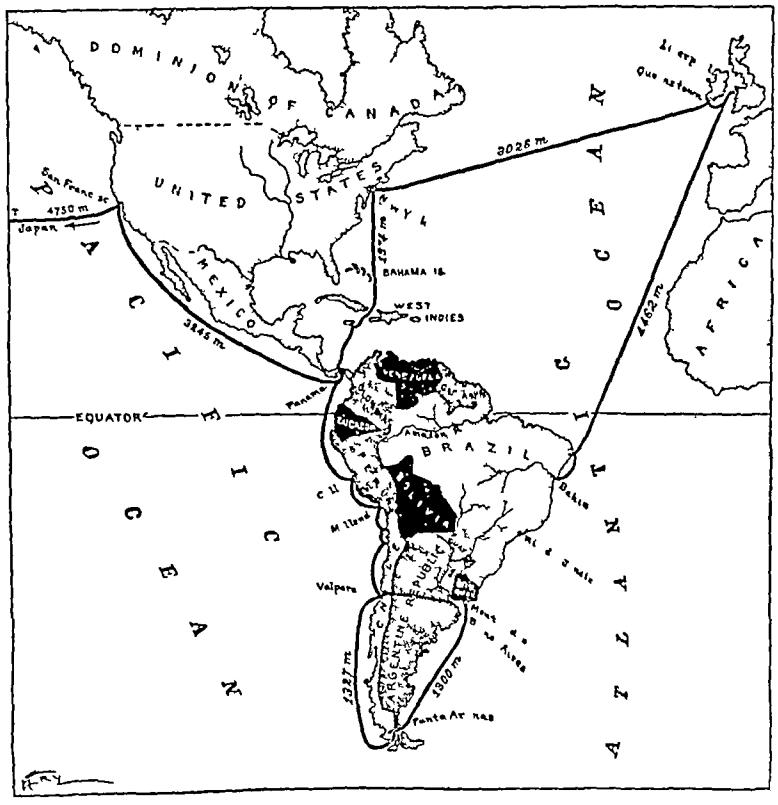

Fig 1—Map of the Western Hemisphere with trade routes

South America lies east of North America, the west coast of South America lies east of the east coast of Florida The Panama Canal is almost straight south of New York Valparaiso, Chile, lies east of New York The west coast of South America, therefore, because of the Panama Canal, has been brought in touch with the United States From the Panama Canal to New York is a distance of 1,974 nautical miles, and from the Canal to San Francisco, 3,245 miles, from the Canal Zone to Liverpool is 4,548 miles, and to Yokohama, Japan, 7,682 miles

In the narrow valleys and coastal plains of the west coast of South America the soil is extremely rich, and sugar and cotton are raised Because the mountains extend to the west coast in portions of the country, and because of the lack of moisture, all that is raised, except in the southern part, is produced by irrigation The mountains are rich in minerals The world's supply of vanadium is in Peru, the tin, silver, copper and tungsten mines of Bolivia, Peru, and Chile are among the richest known, and the nitrate (saltpeter) fields of Chile are the wonder of the world

The trade relations with the west coast of South America have not the possibilities of those of the east coast where the great plains exist On the east coast the distances are not sufficiently in favor of the United States to give any particular advantage The distance from the east shoulder of South America, at Pernambuco, Brazil, to New York, is 4,062 miles, and to Liverpool, 4,467 miles, and since the Gulf Stream runs direct to the British Isles with from a knot and a half to two knots an hour of current, the advantages are considerable in going from the east coast, Rio Janeiro, Montevideo or Buenos Aires, to Liverpool It is true that the return voyage from Liverpool is against the Gulf Stream, but going to and from New York, the Gulf Stream must be crossed The rich portions of eastern South America are tropical and subtropical, and extend down into Argentina Rubber, cotton, sugar and coffee are raised The great fertile pampas of Argentina, which remind one of the prairies of Illinois, Iowa and South Dakota, stretch out for a thousand miles to the south The southern half or more of Argentina lies in a temperate climate favorable to the raising of grains, cattle and sheep

DIRECT CONTRAST BETWEEN NORTH AND SOUTH AMERICA

North America has an area of 8,500,000 square miles, a certain proportion of it lies too far north to be of great value South America has an area of 7,420,000 square miles, but possibly 25 per cent of it comprises the great basins of the Orinoco, Amazon and Parana rivers, areas too low and swampy for continuous human habitation Millions of years may pass before vegetation and the deposits from the washings of the mountains will sufficiently elevate this country for a salubrious climate This lowland region, which extends well up to the Andes Mountains, is very interesting

By entering the River Plata and going up the Parana through the branches of the Amazon, explorers with easy and short portages have finally reached and come down the Orinoco River Much of the low territory is in Brazil, which has two distinct regions, the tropical lowlands of the north and west, and the temperate uplands of the center and south The United States is about the size of Brazil, each containing a little more than 3,000,000 square miles North America has approximately 120,000,000 inhabitants, South America has about 50,000,000, and of these Brazil has nearly half, 24,000,000, who are Portu-

guese speaking people In the remainder of South America the language is Spanish

In a study of the characteristics of the people of North America and South America great differences will be found, since the cultured, intelligent class, white or largely white, in South America is small, while the ignorant Indian class is extremely large Unfortunately, up to the present time there has been almost no middle class in South America, although such a class is in the process of development In the large cities primary education, while not compulsory, is extensive In Brazil the primary schooling is three years, in Peru, Chile, Argentina and Uruguay it is from five to six years The difficulties of general education outside the cities, where the estates are very large and the population scanty, are not easily overcome The course of education in the secondary schools is six years, but these secondary schools are limited in number In the various countries in South America Spanish is generally spoken by the cultured class French and English are the next most extensively spoken In most of the secondary schools English is taught, at least as an elective study Persons intending to go south would do well to learn Spanish, a knowledge of this language will also enable them to communicate with people who speak Portuguese Spanish is easily learned and the vocabulary is relatively small When the vast possibilities of South America, which are equal to those of North America fifty years ago, are considered, and it is realized that South America at the present time is as yet underdeveloped and underpopulated, no prophet is needed to foretell that

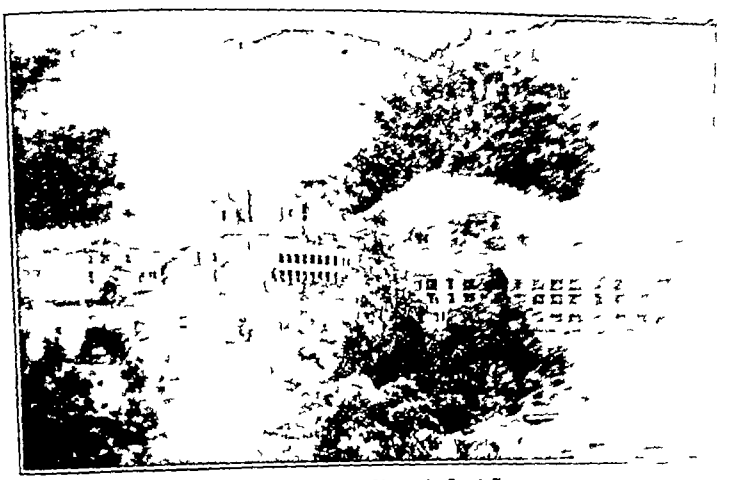

Fig 2—Ancon Hospital Canal Zone

are negroes The great supply of laborers for the building of the Panama Canal was obtained from Jamaica, the French island of Martinique, and the Barbados In Kingston, the capital of Jamaica, are several excellent English physicians Small modern homes of the English type are maintained for the care of white patients A hospital is supported by the English government for the negroes, among the patients a freckled, red-headed negro was seen This hospital also has a ward for white sailors Jamaica is a typical West Indian island, and contains a great deal to interest the northern traveler and the physician interested in the tropical diseases of the negro

The negroes in Central America, especially in the Canal Zone, are often called "silver," and signs of "Silver" instead of "Negro" are used, as the dollar of these Central American countries is on a silver or fifty-cent basis "Gold" denotes the white people, who are paid on a gold basis

[illegible]

Less than two days' sail from Jamaica into the Caribbean Sea bring[illegible] to the Canal Zone [illegible] "the rim of the [illegible]

of the hospital Seven and one-half dollars a day is charged for a private room, and $2 extra for private bath Nurses are supplied for $5 a day on an eight-hour day schedule Thus room and adequate nursing costs $24 50 a day The people of average means cannot, of course, procure such attention, but they have access to the wards at $3 50 a day Employees of the government are cared for in the wards free of charge, and in private rooms with a reduction of about 25 per cent from the regular price There are about eighty registered nurses and a nurses' home, but no training school

There are not enough army medical officers to do the hospital work, and the bulk of it is done by contract surgeons who receive a salary of $200 a month This means, of course, a constantly changing medical personnel An examination of conditions in the United States Army, relative to the medical force, leads to certain reflections Appointments to service in the Regular Medical Corps of the Army are not sufficiently attractive to young medical men to keep the ranks full The medical officers are inadequately paid, without authority in their work, and without facilities for study and observation If they take time for the purpose of obtaining scientific knowledge, it must be taken at their own expense and in lieu of vacation They are under the iron-clad and often unsympathetic rule of purely military men, who are as yet little touched by social progress The West Point man, controlled by unwritten laws, has himself to blame for the suspicion and prejudice of the American people because of his lack of interest in all fields outside the purely military There are so many splendid exceptions to this statement as almost to negate it, and no doubt the system and not the man is to blame for existing conditions At least it may be said for the West Point men that they are honest, loyal and brave The candidate for West Point must be a graduate of a high school After three years at West Point at the expense of the government, he assumes a life position of authority and the controlling of men, a control based on authority not necessarily on ability The army medical officer is a civilian educated at his own expense, with from seven to nine years' training after the high school, as against the two to three years of the West Point man Is it any wonder that young men planning a career of usefulness do not choose the Army medical service? Some of the greatest men in medicine, who by their scientific work have done much to conquer disease and prolong human life, have belonged to this service During the war my brother and I, as chief consultants for the surgical services, were brought constantly in contact with the medical officers of the Regular Army, and I take this opportunity to render merited tribute to the ability, integrity and scientific knowledge of these men The medical officers who controlled the various departments in the Surgeon-General's Office in my opinion averaged higher than men of the same relative position outside the Army Working under rules and conditions not of their own making, they were just and fair-minded, giving loyal service and achieving results which helped greatly to win the war It must be remembered that when we entered the war there were less than 500 medical officers in the Army In investigating criticisms of the medical officers of the Regular Army, I found almost invariably, when I have investigated, that it was the civilian medical officer who had joined the Regular Army Corps after the war broke out who was at fault, and not the officer who had been trained in the Corps The medical profession of the United States owes it to the fine body of men who represent them in the United States Army to take united action to obtain for them authority, position, pay and, above all, opportunity for professional study The medical profession can, if it will, make the Army medical service one which will attract capable young men and keep the quota of medical officers full

THE NURSE QUESTION

The arrangement in the Ancon Hospital of an eight-hour schedule for the trained nurse calls attention to the fact that the registered nurse under present conditions is a luxury that cannot be obtained except by the well to do, and this brings up the question Is the trained nurse a luxury or a necessity? The answer must be that she is a necessity The high-standard registered nurse is one of the greatest blessings of modern civilization She has spent three years of twelve months each in training after graduation from high school, thirty-six months in all, the equivalent of a university course of four years of nine months each, and in a university the same time and work would have won for her the degree of Bachelor of Science The registered trained nurse is not overpaid, considering the character of her training, rather is she underpaid, for she represents the best type of human machine for the care of the sick But we need other types of nurses less highly trained but nevertheless important social service vehicles, the Fords, so to speak, of the nursing world If representatives of the nurses' union are approached on the subject of vocational training to develop a large number of young women for this important work they are indignant and call attention to the fact that standards are being raised for physicians, and they ask why they should lower theirs In this connection it should be remembered that the physician is expected to care for rich and poor alike, and allow no one to suffer for lack of such care, regardless of his ability to pay for service This is not and can never be the case with the registered trained nurse A solution of the problem of the training of a sufficient number of nurses is difficult My sympathies are with the highly trained nurse, and I would be the last one to desire to curtail or reduce the training in any respect, but there are other considerations Only one of 450 students who enter our public schools graduates from the university One in ten who graduate from the high school enters the university, and one in thirty graduates

There is only the equivalent of the university graduate at the present time in the nursing world, and in the interest of all the people there should be different grades of nurses instead of a dominion of the field by an aristocracy The time will come, and soon, when there will be the same grades in nursing that there are in other forms of education, for example, common school nurses for the home and family, high school nurses with vocational training, and the university (registered) nurses The difficulty in carrying out the plan will be in the providing of adequate training for the many young women who may apply for the "common school" course, because the training cannot consist of merely textbook and demonstration courses, but must be the care of the sick in hospitals, the most important part of the preparation Although the difficulties are many, they are not insuperable The first

six months of the course would be the same for all applicants, for various reasons many would stop at the end of this period of probation Those who drop out at the end of the year would receive a certificate of completion of one year's work Those who remain for the second year would receive a certificate of completion of two years' work, and those who fulfil the requirements of the three-year course would receive a diploma of graduation The graduates, who had had preliminary cultural training, after passing suitable examinations at the state university would be granted the degree of Bachelor of Science, as the equivalent of that which is now given for training in medicine, dentistry and other professional branches

THE REPUBLIC OF PANAMA

In the City of Panama the Republic of Panama has a hospital of 500 beds It has a training school for nurses of various tints, very few are white Any licensed physician may bring patients to the hospital and operate This means an unrestricted staff Under the progressive management of the government of Panama, plans are being made for a splendid new hospital to be built on fourteen acres of land, a peninsula projecting into the ocean

ANESTHESIA IN NOSE AND THROAT WORK

ABSTRACT OF THE REPORT OF THE COMMITTEE ON THE ADVANTAGES AND DISADVANTAGES OF THE VARIOUS LOCAL ANESTHETICS *

EMIL MAYER, M D, NEW YORK CHAIRMAN, ROSS HALL SKILLERN, M D, PHILADELPHIA, AND ROBERT SONNENSCHEIN, M D, CHICAGO, COMMITTEE

Following the request of the Council on Pharmacy and Chemistry of the American Medical Association through the chairman of the Committee on Therapeutic Research, the Section on Laryngology, Otology and Rhinology was asked to appoint a special committee to study and report on the special advantages and disadvantages of local anesthesia in nose and throat work, to sift the available data and decide what further investigations would be necessary to clarify the subject The committee was duly appointed, and presents herewith its report

By a happy though fortuitous circumstance we have the honor of presenting this report in New Orleans, the home of Prof Rudolph Matas, who has done more to establish the value of local anesthesia than any other surgeon in the United States, and to whom we are glad to pay our respectful homage for his splendid work in this direction for his scientific attainments, and for the incalculable benefit he has thus given to suffering humanity

Realizing the vast importance of the study of this subject, we arranged the following plan as our objective

To compare local anesthesia and its effects with general

To check laboratory data by *clinical data*

To ascertain what clinical literature offers in support of the use of the several local anesthetics in different conditions, and of concentrated solutions rather than dilute in any case

To determine what cases show idiosyncrasy with a view to determining causes

To ascertain the relative merits of cocain and the synthetic products

To determine whether or not hemorrhage during or after operation is greater under local than under general anesthesia

To study the toxicity faithfully, noting especially injuries to the mucous membrane

To note the effects of the previous administration of morphin in reducing dangers of toxicity, and in adding to the comfort of the patient

To compare the effects of local and general anesthesia and finally to make such recommendation as may be deemed advisable

The study of the literature was undertaken, clinical experience sought and animal experimentation arranged for The study of the literature included the pharmacologic investigations on record In the study of the clinical manifestations it was ascertained that the Council on Pharmacy and Chemistry, believing that not all fatalities were reported inserted an announcement in thirty-eight different journals requesting reports on any fatalities following the use of local anesthetics They received only two replies Your committee had a similar experience in that its request through THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION was followed by but one reply which had nothing to do with the subject at issue A questionnaire was then sent to 150 members of the section and this was very fruitful of results Animal experimentation was kindly undertaken by Prof Robert A Hatcher with a view to ascertain what effect if any morphin had on the toxicity of these drugs From the literature the committee quotes statements from the introduction to the book by C W Allen on Local and Regional Anesthesia by Matas as also by the author, from several nose and throat specialists and from a recent article by Dorman in THE JOURNAL. All show the great advantages of local anesthesia The latter writer in particular quotes Thomas and Cushing who removed a brain cyst under cocain anesthesia in which four previous operations were attempted under general anesthesia and failed although it was entirely successful when done under local anesthesia

A resume of the literature thus presented indicates the advantages of local anesthesia in nose and throat operations

DISADVANTAGES OF LOCAL ANESTHESIA

The disadvantages of local anesthesia are claimed to be difficulty of control of bleeding at the time of operation tendency to postoperative hemorrhage, difficulty of sterilization edema and sloughing and greatest of all, toxicity

After most careful investigation among American operators who favor local anesthesia in nose and throat work—and they are by far in the great majority—no unusual difficulty from bleeding at the time of operation was admitted nor was there any belief that there was a greater frequency of postoperative hemorrhage after local anesthesia than under general anesthesia by the largest majority of operators

It was readily admitted that there was always an element of likelihood of bleeding in an adult whose tonsil had already become fibrous but it was not admitted that the anesthesia had anything to do with the bleeding

STERILIZATION

There seemed to be no doubt that occasionally epinephrin loses its ischemic effect on boiling, and should therefore be tested as to its activity and it is stated that procain is difficult to sterilize MacNaughton-Jones has presented an article on the sterilization of local anesthetics which consists in preparing a solution of sodium chlorid together with the anesthetic and epinephrin chlorid, each constituent being present in such quantity that a dilution with many times the volume of water will give a solution containing the requisite percentage of each The preparation is placed in a sealed vial or ampule and kept until required Sterile water is added before injection

The attention of your committee was called to an apparatus for the triple distillation of water previous to its use as a solvent for procain It was stated that it had been successfully used at one of our base hospitals in New York City Inquiry of the originator as to the reasons for triple distillation failed to elicit any response

* The complete report of the committee will appear in the Transactions of this Section for 1920 also in reprint form

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

EDEMA AND SLOUGHING

The only local anesthetic that produces edema and sloughing is quinin and urea hydrochlorid So many statements were found in the literature that this anesthetic had been abandoned in other fields of medicine because of edema and sloughing, that writers who had presented favorable reports in nose and throat operations were communicated with by your committee One writer who had recorded 390 cases of tonsillectomies extolling this anesthetic which he had used for four years and is still so recorded, now states that he has not used it in two years, although no publication has been made retracting his former endorsement Still another writer, who stated that quinin-urea came nearest the ideal local anesthetic, now states that he has ceased using it Your committee finds that as far as nose and throat operations are concerned, this drug has practically gone into "innocuous desuetude"

IDIOSYNCRASY

Your committee found one case in the literature in which the toxicity was claimed to be due to idiosyncrasy This was that of a woman, aged 43, who had a tooth extracted and 1 c c of a 1 per cent solution of cocain injected She had been treated for years previously for tachycardia excessive perspiration and dysentery Almost complete paralysis followed, the symptoms gradually subsiding after two weeks of illness In this case there was a preexisting neurosis of the sympathetic, tachycardia, excessive perspiration, and tendency to diarrhea The small dose of the drug ordinarily nontoxic, was sufficient to upset the feeble balance of so many years, and this may help to explain the term 'idiosyncrasy"

TOXICITY

This chapter is a most important one in the discussion of disadvantages of local anesthesia and merits most careful study and investigation

We can conceive of nothing more distressing than a death occurring when least expected, within two or three minutes after the injection of the local anesthetic, for an operation that is performed in the largest number of instances to relieve conditions that may add to the comfort of the patient thus prolonging life, but not immediately necessary, to which the patient submits at our earnest advice It is by a study of these fatalities that we may hope to obtain a fuller knowledge of the contributing factors and to reach conclusions that may tend to prevent their occurrence Because so little is known of this subject and because of its vital interest, our research has been thorough into both recorded and unrecorded cases

The toxic effects may range from mild symptoms grave and threatening ones, to sudden death

Recent literature contains the record of two deaths from cocain and three deaths from procain, in one of them a necropsy was made in which neither status lymphaticus nor hypoplasia of the chromaffin system nor any other cause for sudden death was found The small dose of scopolamin and procain with the usual amount of epinephrin added could be dangerous only if some unexplained susceptibility existed The writer can find nowhere in the literature a suggestion that danger exists from intravenous injection (he is evidently unacquainted with the work of the American pharmacologists) Death here was due to the heart, evidently an abnormal susceptibility to the drugs on an unusually bad heart Some half dozen cases of toxic effects, nonfatal, are briefly recorded, taken from the literature as also one death from apothesin Mention is made of an article by H C Hamilton, who states that epinephrin is an adjunct to and an antidote for apothesin poisoning

Several cases of poisoning are also mentioned following beta-eucain Macht finds that *benzyl alcohol* has lower toxicity than cocain He says it has as good anesthetic properties, is quickly excreted, easily sterilized and is cheap and satisfactory clinically Fatalities are recorded following the use of stovain McMechan declares that procain is from one-fifth to one-seventh as toxic as cocain, and suggests the advisability of adding an alkaloid like sodium bicarbonate, making it much more useful for anesthesia

NEW LOCAL ANESTHETICS

Allocain S (soluble) and Allocain A (insoluble) are made from a Chinese drug with the addition of a synthetic alkaloid The object of the originator was to obtain a body possessing the local anesthetic properties of cocain, together with the vasoconstricting action of epinephrin It is claimed for Allocain S that among other properties it inhibits the growth of streptococci and staphylococci

CLINICAL INVESTIGATIONS

As nothing was learned of toxic effects through requests in medical journals, we prepared a questionnaire, seeking information directly from fellow-members of this section of the Association, and 85 per cent of these answered While this large number of responses is eminently gratifying your chairman regrets that even so small a number should be found who fail to answer to their own committee on a subject of such vital interest to themselves The result of this questionnaire has been exceedingly valuable and interesting We have received reports of the anesthetic used, its dosage etc, but have also many reports as to toxic effects, nonfatal, and further, a record of twenty deaths, most of them not previously recorded

REPLIES TO QUESTIONNAIRE

The following was submitted

1 What method of local anesthesia do you use for operations on the nose?

2 On the throat?

3 Do you use an anodyne first? If so what doses?

4 What toxic effects have come under your notice?

5 Do you know of any fatalities?

Answers were received from about one hundred, and these are detailed in the report Your committee received replies relating to twenty deaths, two from nose operations, and eighteen from throat operations, and these are briefly presented herewith

1 Procain injected No further details No amount stated

2 Large fat girl of about 20 for tonsillectomy About 3 drops of solution said to have been injected with immediate death 0 5 per cent cocain in epinephrin 1 10 000

3 (*a*) A girl aged 20 with severe endocarditis Injection of tonsil immediate death Necropsy large vegtations in heart interference with valve action Heart stopped in systole Five-tenths per cent solution cocain (Two deaths)

(*b*) Officer aged 25, previously operated on (submucous and ethmoid) without toxic effect One tonsil injected, immediate death Necropsy marked enlargement of thymus with general glandular enlargement Cocain, 1.2 per cent. solution

4 Injection of 20 minims of equal parts of 1 per cent cocain and epinephrin 1 1 000 for tonsillectomy The patient became faint and died in less than three minutes

5 No further details Injection of 5 per cent solution of cocain instead of swabbing

6 Immediately following injection of less than 1 dram into peritonsillar tissue great apprehension air hunger, convulsive movements succeeded by cessation of respiration and gradual cessation of pulse Injection of 0 75 per cent solution of procain and epinephrin 1 30 000 into peritonsillar tissue

7 No further details Ten per cent solution of cocain injected mistaken for 1 per cent procain solution

8 Twenty per cent solution of cocain in larynx Patient died almost instantly after application

9 A robust man aged about 43 after two syringefuls fell to the floor unconscious and died in spasm in a few minutes (Mistake of druggist) Ten per cent cocain solution injected around tonsil, mistaken for 0 10 per cent solution

10 A man, aged about 28, had an attack of angina pectoris and died two hours after operation Necropsy revealed fatty degeneration of the heart muscle Cocain and epinephrin injected, strength not stated

11 Patient received, in all about 2 drams, 0 2 per cent cocain in epinephrin was injected, death occurred in one hour

12 No further details Injection of ¼ grain of cocain into the anterior pillar with death in four minutes

13 Woman aged 30 Local application of cocain, 10 per cent followed by injection of procain 0 5 per cent, with 8 drops of epinephrin to 4 drams One dram injected into

each tonsil First tonsil removed, when patient gasped and died

14 Woman, aged 21 Three syringefuls injected under the mucous membrane of each faucial pillar Injection of 2 per cent cocain with equal parts of epinephrin, 1 1 000

15 No further details Cocain applied to throat and epiglottis

16 Woman, aged 25 Injection of about 100 minims of 0 5 per cent procain with 2 drops of epinephrin chlorid After about three minutes a slight convulsive movement involving the head and neck was noticed, followed in a few seconds by one more severe attack, including the shoulders, chest and upper arms Tightly closed jaws dilated pupils fixed gaze wide palpebral fissures, stertorous breathing moderate but soon marked cyanosis passing of the violent convulsive seizures into a marked and general tremor Cardiac action, 120, complete respiratory paralysis in ten minutes Cardiac action continued some time

17 Injected into tonsil the patient dying instantly (Mistake of druggist) Twenty per cent solution of cocain injected instead of 0 5 per cent

18 Injected 0 5 per cent procain after painting with 10 per cent cocain solution

The nose operations that had a fatal ending were for septal operations (1) a weak solution of procain and epinephrin injected into the septum, with immediate death, (2) a 10 per cent solution of cocain mistaken for the 1 per cent solution injected into the nose

A review of these fatalities shows that fourteen occurred as a result of the administration of cocain and six from procain Of the cocain deaths five were due to avoidable mistakes, the remainder died within a very short time as a rule after the administration of the drug, usually within three minutes

Some of these cases have already been recorded and there is no means at hand of ascertaining the proportion of deaths occurring as compared to the number of cases in which local anesthesia was used

As deaths have been recorded following rapid injection of epinephrin in 1 1 000 solution, your committee has carefully gone into this question but has found no evidence at hand that epinephrin in these cases was a causal factor

THE ADMINISTRATION OF MORPHIN BEFORE OPERATING

As quite a number of our associates usually employ morphin preliminary to operating or immediately after and as it was claimed that its administration previous to operation added much to the comfort of the patient, lessened the dangers of the local anesthetic and added greatly to its lasting effect, this subject was included in the questionnaire and animal experimentation was made to help elucidate it In one of the animal experiments a cat had been given a poisonous dose of chloral hydrate It was then replaced in its box and slept off its effects Another animal was given the same dose and fastened to a board, when it promptly died This would indicate that excitement might be an added danger which morphin would tend to subdue

PHARMACOLOGIC STUDIES ON LOCAL ANESTHESIA

A brief summary is given of the more recent studies of the various synthetic preparations in use for local anesthesia, as also a report of animal experimentation made for this investigation particularly in reference to the use of morphin and atropin preliminary to operation under local anesthesia The protocols of these examinations follow and your committee finds that the result of these investigations as to the use of morphin is rather negative If anything it shows that the cat succumbs more readily to a poisonous dose of both drugs In the human being there is in many instances a state of apprehension to operations which the administration of morphin is likely to allay and your committee believes that its use is not contraindicated and should be further tried

COMPARISON OF LOCAL AND GENERAL ANESTHESIA

Your committee finds that local anesthesia is the method of choice by practically all American rhinologists There is less hemorrhage far greater safety especially when operating near the cribriform plate and the dangers of toxicity will compare favorably in the use of the local anesthetic in preference to any general anesthetic Even the nitrous oxid and oxygen combination, looked on by many as absolutely safe has a record of deaths that destroys that assuredness One observer has reported thirty-seven deaths from this safest' anesthetic

In throat operations the unanimity is not so great a small minority adhering to general anesthesia for greater rapidity in work and ease and comfort to the operator

The majority operate under local anesthesia and declare themselves to be entirely content therewith

The ideal anesthetic having the effects of cocain and absolutely nontoxic has not been found and we realize that the successful anesthetic of today may be discarded on the morrow, nor are we averse to the reporting of those which seem successful at the moment, but we deem it essential that once having so recorded and endorsed it especially if unqualified the same publicity should be made in the event that one has ceased using the drug for grave and important reasons

It should be understood that this entire report refers to *adults only*

SUMMARY

As a result of the study of the literature clinical experiences and animal experimentation we conclude that

1 There is a remarkable similarity in the clinical effects and animal experimentation

2 None of the synthetic products equals cocain in its local effect when applied to the mucous membrane

3 These synthetic products may be freely injected, if slowly done in proper doses in unlimited quantities

4 Fatalities either occur immediately or not at all

5 The drug is eliminated in the liver

6 The greatest danger lies in too rapid injection or entering a vein

7 A peculiar susceptibility which we term idiosyncrasy does exist, as the drug enters into the circulation so rapidly that death is almost immediate

8 A further study of the toxicity of these local anesthetics will result in definitely establishing the causes of death

9 Local anesthesia is undoubtedly the choice of methods by all American rhinologists in nose operations

10 It is also the choice of a very large proportion of American laryngologists in throat operations

11 There is a small number who believe that tonsil operations particularly are best performed under general anesthesia

12 The dangers of hemorrhage during tonsil operations under local anesthesia are no greater than under general

13 There is no greater danger from postoperative hemorrhage under local than under general anesthesia

14 The previous administration of morphin requires further investigation

SUGGESTIONS

Your committee suggests that all operations be performed with the patient recumbent beginning with the first application of the local anesthetic except in sinus operations, in which the head and shoulders may be elevated to an angle of 45 degrees and the table raised so that proper direction may be maintained

Each operation should be preceded by a hypodermic injection of morphin and atropin and the patient kept in the hospital

In nose operations epinephrin should be applied first followed by cocain and the injection of the synthetic drug *introduced slowly*

In throat operations a 5 or 10 per cent solution of cocain should be applied followed by the *slow injection* of the synthetic product

When there may be a suspicion of possible danger one fourth of the amount of anesthetic to be used at the time of operation should be applied and the patient watched for possible toxic effects

Among the cases included in the latter are those with evident cardiac disease exophthalmic goiter, or other disturbances of internal secretion

CONCLUSIONS

Local anesthesia is the ideal method of operating for affections of the nose and throat

None of the dangers that have been mentioned are any greater than those following general anesthesia

The question of toxicity has heretofore not been sufficiently studied, and we are grateful to the Council on Pharmacy and Chemistry of the American Medical Association for proposing this investigation, and while the preparation of this report has entailed much labor, practically constant for nine months, your committee feels that it will not have been in vain if we have thereby added to our knowledge of the causes of fatalities, thus preventing their occurrence in the future, to say nothing of the exceeding value that such formal conclusions will have to some colleague who may hereafter be confronted with one of these most distressing results

RECOMMENDATIONS

In order that our work may be constructive your committee recommends that a permanent committee on toxicity following local anesthesia be formed, with the secretary of the section as a member, and that the secretary mail a copy of these resolutions to each registered member of the section asking that reports of fatalities hereafter occurring should be promptly reported to him for further study by the committee

This would require the cooperation of every member, and in return the committee would pledge itself to present to each participating member the result of its findings in the form of a sworn affidavit for his support in the event of a fatality thereby preventing possible legal action, or at any rate providing the assurance of cooperation and support from an independent source

Your committee further recommends that a change be made from the old method of introducing new local anesthetics

The method heretofore has been that clinical data were furnished by medical men chosen by the manufacturer the Council on Pharmacy and Chemistry making its studies, and the product then if favorably reported on placed on the market We would suggest that clinical investigation should be made by clinicians of our own choosing directly after the pharmacologist has made his investigation

As such investigation requires much personal attention with careful annotation of the effects of the drug and a reasonably prompt report of the clinical investigation we would suggest that a fund be placed in the hands of the Therapeutic Research Committee to reimburse properly the physicians who are making these studies, devoting many hours of their time thereto

In presenting this report, your committee desires to state that its statements as to the advantages and disadvantages of local anesthesia are entirely impersonal, no one's individual preference is expressed, but rather a composite expression of the views now held by all rhinologists and laryngologists

No one local anesthetic is favored and a fair and impartial statement is made of the merits or demerits of each

In presenting suggestions for the methods of operating *safely under* local anesthesia we have combined those endorsed by many of the most earnest and active of our colleagues in the profession

From the great mass of evidence obtained from the writings of and many personal interviews with the clinician and the pharmacologist we have carefully sifted the evidence and based our statements thereon

Our recommendations for such improvement as may tend toward a clearer knowledge of the subject than now obtains and the institution of newer methods in the introduction of new anesthetics as against the older and more archaic methods, are our *own and express* our verdict for your consideration and approval

Finally, we recommend the use of the soluble tablets of cocain for making the solution freshly as required one to be dissolved in hot sterile water by the operator Each 240 minims of this solution makes a 0 5 per cent solution The unnecessary deaths quoted from 'mistake of druggist or "of nurse would thus be avoided

While the work of your committee has been very laborious during these many months, it has been made easier by the stimulus of the hearty cooperation, encouragement and approval of Prof Torald Sollmann, chairman of the Therapeutic Research Committee as also of Prof Robert A Hatcher, of the Department of Pharmacology of the Cornell University Medical College, whose scientific zeal and great willingness to assist and perform new animal investigations have been a source of great inspiration

Our sincere thanks are due to Dr Cary Eggleston for his cooperation in assembling the resume of the literature on animal experimentation, to Dr T F Galloway for much assistance in abstracting such literature as was suggested, to the members of this section, whose replies to the questionnaire have been of exceeding value and added much to our opportunities for study, and to the Council on Pharmacy and Chemistry of the American Medical Association, which voted a sum of money to defray the incidental and necessary expenses incurred in the preparation of this report

Your chairman wishes also to extend his personal thanks to his associates on the committee, Dr Skillern and Dr Sonnenschein, for their aid in promptly assembling the investigations assigned to them and their most hearty cooperation

If, as a result of our labor we have added to our knowledge of this important subject eventually resulting in the saving of human life, thus adding to the value of our services to humanity, your committee will feel itself amply repaid

---

ABSTRACT OF DISCUSSION

DR. FRANCIS P EMERSON, Boston I move that the recommendations of the Committee on Local Anesthesia be adopted, namely that this Section endorses the plan for the investigation of new remedies by members of the American Medical Association, when the Council on Pharmacy and Chemistry has concluded its examinations, also that the Chairman appoint a permanent committee of four on the Toxic Effects of Local Anesthetics, one to be the Secretary of the Section This committee to report at the following annual meeting (Motion seconded and carried)

DR WENDELL C PHILLIPS, New York I move that in the investigation regarding local anesthesia during the next year, the committee consider the question as to whether cocain, on account of its habit forming tendencies, could not be eliminated from the pharmacopeia of the nose, throat and ear specialists I have recently been in conference with representatives of the government, and this question was raised knowing that I specialized in diseases of the nose, throat and ear I introduced this resolution in order that we may be prepared to act intelligently regarding this matter in case the authorities see our opinion

DR RUDOLPH MATAS, New Orleans I wish to commend everything the chairman of the committee said However, there is room for further investigation Let us hope that in the future some elaboration of the facts presented today will be given to us as an additional contribution General surgeons come in contact with the different anesthetics perhaps more than do the specialists The first question to be answered is what agent do we prefer We began with cocain Then came a series of new agents, some gave good service and some did not Procain is one of the best local anesthetics We use apothesin at the Charity Hospital practically to the exclusion of everything else We think that procain and apothesin are nearly in the same class From the point of view of toxicity there is no difference, but procain has, perhaps, a little more lasting effect, apothesin has a temporary effect In the beginning apothesin was not so valuable because it was irritating, but since chloretone is left out it is just as agreeable as procain I would say, however that procain is the approved local anesthetic for use in every field It is all very well to report successes and to give favorable information regarding any anesthetic, but do not fail also to state afterward when you no longer use it, that you have changed your mind or that you have been mistaken in your interpretation of results That is one great trouble about medical reports We are always ready to report our successes, but we are very reluctant to report our failures or to retract It is our duty to tell if our opinion has been changed In my early experience with quinin and urea hydrochlorid I found a greater tendency to necrosis of the tissue There was an exudate, and local effects on the tissue were marked I would not use it at all, except in certain regions about the rectum where it undoubtedly has

some advantage, where the pain lasts a long time and the duration of the anesthesia is desirable The question of preliminary anesthesia has been brought up, and the Committee doubts whether it is an advantage to give morphin and atropin as a preliminary anesthetic There is no doubt in our minds about it in general anesthesia There is no doubt that it is a mode of anociation, and the effect of quieting the patient is an immense help In certain cases of throat work I think the atropin, which is a little more dry, is better The effect of morphin or scopolamin, given one-half or three-quarters of an hour before the general anesthesia is begun, is very good I do not think anything has contributed more to the success of local or regional anesthesia than epinephrin If anything has lessened the toxicity of local anesthesia, it is the use of epinephrin It was not so much a question of dosage because we can restrict the area In this way the whole field of regional anesthesia has increased so that we can now perform operations that were impossible twenty years ago I do not think that we can pay too great a tribute to Braun and his followers for introducing epinephrin The question of sterilization is hardly relevant Cocain was most difficult to sterilize in the early days, it was done by boiling The fractional sterilization overcame that We need not worry about sterilization now because it is easily done The question of toxicity is linked with idiosyncrasy In 1883 thirty deaths from cocain were reported from Paris Reclus attempted to solve the problem why these deaths occurred He favored cocain He found that all but seven of these patients had had an excessive dosage of the drug, in seven cases the cocain itself was responsible Since that time the question of the toxicity has been relegated to a secondary place in general practice

Since we have been using epinephrin we have seen no toxic effects We use it freely The solutions have always been weak 0 5 to 1 0 per cent, and always containing epinephrin Deaths do occur, however, as the report shows There is such a thing as an idiosyncrasy to cocain, but it has almost vanished since we know more about handling it One of the chief mischief makers is the strong, 10 per cent topical application of cocain I would like to get rid of this procedure The report says that every one is agreed that nothing can take the place of cocain as a topical application I agree to that but we have found in general practice that the topical application of a strong solution of procain answers practically all purposes Of course that is a question entirely in the domain of the specialist We have no right to introduce our opinions when it comes to topical applications but it seems to me that all operations in the nasopharynx of the adult can be done with local anesthesia to the greatest advantage In doing tracheotomies or laryngectomies, where the distress is great simply inject into the larynx a few drops of procain which is quite sufficient to produce complete quiet Local anesthesia will never be popular with the amphitheater teacher, the one who has an audience He cannot separate himself from his patient, he cannot entrust that to an assistant and therefore you will not find the men working in the large amphitheaters of this country interested in local anesthesia Local anesthesia is to be used where there is quiet, when the patient is properly prepared, where there are no distracting noises, where the proper man can do his work in the proper technic For that reason it will never supersede general anesthesia The greatest lesson for the student is to see the work done, the preparation for and the giving of the anesthetic but he has to do it himself, and that can be accomplished only in small groups Then there are persons who are psychically unfit for local anesthesia, who are sympathetic, who are in a constant state of agitation Again, some persons die without having had any anesthetic given them Every one has had such an experience In one case of enlarged thyroid to be removed we tried the plan of anociassociation bringing the patient to the operating room to make her familiar with the surroundings Finally one day we thought we could try the ligation The patient was apparently quiet and composed As she was being placed on the table and before she had any anesthetic one of the attendants allowed one of the lower parts of the table to slip and it came down with a bang The report startled her, she gave a convulsive movement and was dead If we had injected cocain it might have been said to be responsible

DR CARROLL W ALLEN, New Orleans One point on sterilization might be emphasized, and that is that many agents used by rhinologists and laryngologists stand boiling badly particularly cocain It has been suggested that cocain crystals be placed in a dish absolute alcohol poured over them allowing the alcohol to evaporate, when it can be added to sterile water We find a better way is to use benzin or gasoline, because alcohol is not always destructive of all organisms What effect it may have on some of the synthetic preparations, experience will show but it does not impair the efficiency of cocain or procain Regarding quininurea hydrochlorid I endorse what Dr Matas said We have abandoned its use except for a very limited field about the anorectal region The particular subject that attracts my attention is toxicity I have had very little toxic action a little loquacity on the part of the patient was about all that could be noticed I have been called in to assist in the resuscitation of many patients Take cocain as a type Cocain is a universal protoplasmic poison It affects all protoplasm, vegetable or animal alike It paralyzes the white blood cells muscle fibers nerves of special sense as well as sensory nerves It forms a chemical combination with the protoplasm, and when broken up and liberated from the protoplasm is not liberated as cocain, but as ecgonin which has slight toxic action If the action of cocain in producing anesthesia is the result of a definite combination with protoplasm that particular part of the anesthetic from which we are getting the anesthesia cannot give a toxic action because it is fixed in the tissues When toxic action results it is because of an excess having been used over what was necessary to saturate the tissues and paralyze the nerves Of course we enter veins occasionally, and we should always observe the rule when injecting in the neighborhood of vessels to aspirate occasionally and always before making an injection of a concentrated solution Whereas I admit the existence of an idiosyncrasy to many things I have not seen one to cocain in an experience of probably twenty years Fully 50 per cent of my own work is done under local anesthesia I would advise always where the nose and throat men use a concentrated solution that they commence with a weaker solution and thus be able to recognize those cases that present an idiosyncrasy Regarding morphin it is a very useful drug as a preparatory agent Highly neurotic and excitable individuals stand cocain and other local anesthetics poorly We should try to induce in patients a phlegmatic state a state of indifference, and just enough morphin for that purpose has a very desirable action on the nervous system as well as actually preventing toxic reaction When the nerves are under the influence of morphin they are less sensitive to the action of cocain, and they respond very much less rapidly to the cocain so it takes a larger dose to produce the same effect But morphin as an antidote to cocain is perfectly useless The best antidote for cocain poisoning is ether No agent will stimulate as quickly and combat the toxic action of cocain as will ether by inhalation to the point of stimulation only

DR EMIL MAYER New York I was particularly glad that Dr Matas stated that there is everything to be said in favor of the preliminary use of morphin as a sedative and that the request of the committee that it be more generally tried should be complied with One point occurred to me when Dr Allen stated that ether is an antidote for poisoning by any of these toxic drugs If the patient is so quickly paralyzed that respiration ceases where is the ether coming in? These patients do not even breathe and it would seem to be almost impossible to have the ether do any good My own experience has shown that some men believe that hemorrhage is far more frequent after local than after general anesthesia The war had much to do with converting men to the use of local anesthesia in tonsil operations, because American laryngologists were of the opinion that hemorrhage was no more frequent after local than after general anesthesia We tried to keep our personal opinions out of the report We have merely stated the opinions of the great majority of American laryngologists

NEWER CONSIDERATIONS REGARDING DIABETES

It is obviously of immense importance in the management of diabetes to know whether the impairment of nutrition is inherently and inevitably progressive or whether controllable factors, among which diet is foremost, exercise a decisive influence on the weakness of bodily function Experimental investigations, notably those by Allen [1] in this country, have at length shown that virtually every detail of clinical diabetes can be reproduced in partially depancreatized dogs The resemblance is made still more exact by the susceptibility of such animals to acidosis and coma, and also by the similarity of the anatomic changes in the islands of Langerhans These animals are therefore useful test objects for a therapeutic investigation

A significant effort to determine whether a diet rich in carbohydrate is the etiologic factor in cases of diabetes in which impairment of the pancreas cannot be related to known disease processes, such as cancer or infection, was made by Thirlow and Jacob [2] They have reported that partially depancreatized dogs, remaining free from diabetes on a diet of meat, develop a fatal diabetes on prolonged carbohydrate feeding They concluded that the pancreas remnant, adequate to prevent diabetes on a meat diet, is "overstrained" by the prolonged carbohydrate diet

This fundamental contention that, when the functional remnant of the pancreas is considerably reduced, inappropriateness of diet may determine the onset of a disease having glycosuria as its prominent symptom, has since been established more firmly by the large number of experiments recorded by Allen from the Hospital of the Rockefeller Institute for Medical Research He has further shown that the diabetes may be initiated or aggravated in the potential cases by overfeeding with foods other than carbohydrates Sugar is formed in the organism from protein as well as more directly from starch According to Allen, the downward progress of individuals having a minimum of functional pancreatic gland may be due to excessive diet of almost any sort The outcome, on Allen's hypothesis, is the result of food injury resulting in an overstrain of the pancreas as an endocrine organ Allen [3] finds that in the early stage glucose is more powerful than starch in producing diabetes, and animals which are progressing toward complete recovery on a starch diet can be sent into hopeless diabetes by the admixture of glucose The difference seems to be merely of the rate of absorption, and indicates that a rapid flood of carbohydrate is more injurious to the pancreatic function than a slow absorption Whenever permanent diabetes is present, so that complete recovery is impossible, starch brings on glycosuria more slowly than sugar but just as surely The difference in time in different cases amounts to days, weeks or months The clinical lesson from such experiments is that even if a patient becomes free from glycosuria on withdrawal of sugar only, nevertheless other foods should also be limited No significant differences were observed between the assimilation of different starches, or any extreme lowering of the carbohydrate tolerance by proteins, such as alleged by certain writers in connection with the "oatmeal cure" No specific differences were observed between the glycosuric effects of the different kinds of protein [4]

The most promising feature of Allen's recent work is the demonstration,[5] if it can be accepted as such, that there is no inherent progressiveness in the diabetic tendency in its early stages With appropriate restrictions in the diet, animals exhibiting a state of potential diabetes through deprivation of part of their pancreatic tissue could be caused to gain in tolerance and to maintain a condition of health Further evidence that injurious changes were not in progress was furnished by the intact state of the islands of Langerhans in the residual pancreatic gland However, when the capacity to metabolize is strained by overfeeding, as is so often done in attempts to preserve or increase the weight of human diabetics, disaster inevitably follows Allen states that every detail of the downward progress of human patients on various diets is reproduced in such animals They lose assimilation and die most rapidly on diets rich in carbohydrate, and less rapidly on excess of other foods The differences between sugar and starch, and between starch and protein, seem to be only those of degree and time rather than anything absolute The important point is that, granting the absence of spontaneous downward tendencies as stated, all the different kinds of downward progress are purely the results of overstrain of the internal pancreatic function by excess of food

Admitting the facts just noted, it should be remarked, however, that the validity of the theory of the production of the pancreatic impairment as a direct result of physiologic "overstrain" has been questioned by Jensen and Carlson [6] These Chicago investigators point out that many other organs, such as the thyroid and the kidneys, respond by hypertrophy rather than atrophy when they are reduced in volume and called on for more than the usual amount of performance They admit, in harmony with other observers, that when the functional capacity of the pancreas remnant is too small to prevent diabetes, the residual tissue undergoes virtually no hypertrophy, but they allege that this failure may be due to the unfavorable influence of the diabetic condition on growth in general, rather than to specific "overstrain" of the pancreas remnant Whatever the correct hypothesis may be, the favorable effects of partial undernourishment in the management of many diabetic patients can no longer be denied

PELLAGRA IN EGYPT

It is an interesting coincidence, likely to contribute to medical progress, that during the course of the extensive investigations of the United States Public Health Service on the occurrence and possible causes of pellagra in this country, somewhat comparable studies have been undertaken by British authorities in Egypt In a recent issue of THE JOURNAL,[7] it was pointed out that the facts ascertained during the last few years, notably by Goldberger [8] and his associates, are decidedly antagonistic to the view of a pellagra infection, but are favorable to the long alleged relationship between diet and disease In the judgment of the American workers who believe that they have actually been able to produce pellagrous symptoms in volunteer subjects by the administration of faulty diets similar to those commonly consumed in families in which the disease occurs, several dietary factors may be involved The possibilities that are foremost in their suggestions are an amino-acid deficiency, such as may be occasioned by a diet low in protein of poor quality, faulty mineral supply or constitution, and perhaps an as yet unknown vitamin factor What combination or combinations of these deficiencies really constitute the specific pellagra-producing defect remains to be accurately determined In their feeding experiments on man, Goldberger and Wheeler observed that scrotal lesions are much more common early skin manifestations of pellagra than has heretofore been realized They suggest that the site of at least the initial dermatitis accompanying an attack is bound up with a specific quality of the diet Indeed, the view is further advanced that there may exist essential differences in the intimate make-up of the diet corresponding to observed differences in some, at least, of the clinical types of the disease

In 1918 there were many prisoners of war in Egypt, among whom pellagra appeared to an alarming extent Both Turkish and German prisoners were attacked The committee of inquiry appointed by the British government to examine the situation filed a report, of which some details have recently appeared,[9] along with reports by some of the medical officers who studied the outbreak [10] The magnitude of its occurrence can be gaged by the statement that one physician alone saw about 2,000 clinical cases and actually performed necropsies in 300, during three years' residence in an Egyptian hospital for prisoners of war There was no evidence of a primary specific bacterial or protozoal infection, but intercurrent infections account for virtually all of the deaths Spot maps showed that there was no infection from place or person Notable is the fact that the disease occurred in Turkish camps, not—so the report asserts—to any noteworthy extent in the camps of Germans alongside, where there was money to buy extra food In the diet of the Turkish prisoners who had suffered from long-continued undernourishment, the protein came mostly from wheat, barley or maize, with very little from meat The implication is that a prime factor in the causation of the disease observed in Egypt was a defective protein supply We shall not suppress the fact that, as among our American investigators some continue to adhere tenaciously to the possibility of an infectious genesis of pellagra, so there are among the foreign observers a few, like Enright,[10] who are unwilling to accept the food deficiency theory All in all, however, with so much unanimity in the current American and British scientific opinion regarding pellagra, the discovery of the precise pathogenic factors is almost certain to follow, even now, the path of dietary safety seems to be quite clearly outlined

DYE WORKERS' CANCER, AN IMPORTANT INDUSTRIAL DISEASE

In any consideration of the general problem of the etiology of cancer, one of the important, outstanding features of comparatively recent development is the fact that chemical irritation is quite as potent as mechanical irritation in producing malignant growths Indeed, the classical illustration of cancer production by mechanical irritation in the case of the chimney sweep is now generally believed to illustrate rather the

effects of chemical irritation by products of the destructive distillation of wood and coal Paraffin workers' cancer is now an accepted reality, and the only successful production of experimental cancer by artificial agencies is that of Yamagiwa with his rabbit ear epitheliomas produced by applications of coal tar When, in 1895, Rehn announced to the German Society that cancer of the urinary bladder was observed with especial frequency among workers in anilin dyes, he not only pointed out an important situation in relation to industrial diseases but also called attention to a very significant point in connection with cancer etiology Although he based his statement on but three observations, nevertheless, his conclusions, which were criticized as premature by many, have since been found to be entirely correct Several other surgeons in districts where large dye factories exist have since corroborated this striking fact, and in an extensive discussion of the subject from the clinical and the chemical side Nassauer [1] finds reports of eighty-nine cases of bladder cancer occurring in anilin dye workers To these should be added sixteen of the twenty cases recently reported by Oppenheimer,[2] four of his cases apparently having been included by Nassauer

One of the striking things about these tumors is the long interval between the first exposure of the workman to the dyestuff and the appearance of the first symptoms of cancer Ordinarily this is more than ten years, most usually about fifteen years, and in some as late as twenty-eight years, but in one case cancer developed in two years In many instances the cancer has developed in workmen who have been engaged in other than dye work for a period of ten years or more While this seems to indicate that the early injury to the bladder persists until cancer develops, it must be considered that part, at least, of this apparently long incubation period may depend on the fact that commonly the first exposure begins before the subject has reached an age at which cancer is likely to develop Even as it is, the age incidence is low, most of the victims being between 34 and 47 years old Because of the shifting of workmen and the long period of incubation, it is not possible to state how large a proportion of men exposed to this danger develop cancer, or for how long a time they must be exposed in order to be jeopardized Nassauer states that the twenty-eight cases he has studied occurred in a plant employing about 105 workmen, and he intimates but does not state specifically that not many of these workmen were transients Oppenheimer believes that the incidence is even higher than this

Nassauer is of the opinion that it is unsafe for men to be exposed to the more dangerous substances for more than three months, but believes that with proper hygiene in respect to cleanliness of person, and especially with the installation of necessary devices to prevent unnecessary contact, the danger can be largely if not entirely avoided In the factory in which he has observed so many cases, such precautions were introduced in 1905, and not a single case has been observed in workmen who began dye work in the fourteen years that have elapsed, although he admits that in view of the long incubation period it is not fully established that the danger has been entirely avoided He also calls attention to the fact that numerous cases of bladder cancer have been observed in people living in the immediate vicinity of dye works, although they themselves were not occupied in the plants, a circumstance which he believes is significant, although it is not possible to establish the etiologic relation of the dye works to the disease in these cases

Taken from the other point of view, controlling the conclusion that the dyes are responsible for the bladder cancer is the fact that in the series of cases of bladder cancer in which operation was performed at the university clinic at Basel from 1901 to 1910, of sixteen cases of bladder tumor twelve occurred in persons working with dyes Furthermore, in the forty preceding years, only six cases of bladder cancer were treated in this clinic, presumably because of the long period of incubation required to produce cancer after the first installation of anilin dye factories in that city In the surgical clinic at Frankfort, from 1895 to 1918, inclusive, there were observed ninety-two cases of bladder tumors, twenty-two of these occurred in dye workers, and in twenty-four the history does not exclude relation to dye work Eliminating these twenty-four cases as uncertain, twenty-two cases of bladder cancer occurred in dye workers and forty-six in men known not to have been engaged in this occupation certainly a striking proportion in a community such as Frankfort, where only a very small proportion of the male population is employed with dyes

As to the particular chemicals and dyes which are responsible for the production of cancer, it is rather difficult to draw conclusions since most of the patients have been exposed to many substances Nassauer discusses this problem at length It has generally been believed that anilin itself and benzidin were most probably the important agents Nassauer is convinced from his own observation that the anilin alone is responsible If this is correct it will greatly simplify the avoidance of this menace in dye workers As yet no experimental evidence has been obtained as to the production of tumors by anilin or other chemicals used in the dye industry, and probably until that is done it will be difficult to reach positive conclusions Cancers outside the urinary tract are not observed among dye workers with any noticeable frequency

During the war there was a great increase in work which involved exposure to anilin, and in addition

1 Nassauer Max Ueber bosartige Blasengeschwulste bei Arbeitern der organischen chemischen Grossindustrie Frankfurt Ztschr f Path 22 353 1920

2 Oppenheimer Munchen med Wchnschr 67 12 1920

many women were engaged in work leading to contact with aniline Time alone will tell whether this war work will produce new cases of bladder cancer Oppenheimer was unable to find that the duration and intensity of the exposure to the injurious substances had any influence on the production of cancer Presumably the aniline may be absorbed through either the skin or the respiratory tract and possibly also by swallowing dust and vapor which enters the mouth No particular type of bladder tumor is characteristic for the dye workers, both papillary growth and ulcerating carcinoma being found, and the prognosis with the malignant tumors is very unfavorable No publications on dye workers' cancer seem to have appeared in the United States, although paraffin workers' cancers have been observed here[3] With the recent development of the dye industry in the United States, this particularly serious industrial disease must receive consideration

Current Comment

INTERNAL FIXATION OF FRACTURES

With the advent of aseptic surgery, it became possible to perform open operations on bones with relatively slight danger of infection This encouraged operators to treat a large proportion of fractures by one form or another of internal splint rather than trust to the classic methods of reduction and fixation There has been much debate as to the indications for open treatment, at present, opinion on that point appears to be well settled, and discussion now is as to the kind of material that shall be used as the splint The indications for internal fixation may be grouped as fractures in which there is failure either to obtain or to maintain reduction by the older methods, and ununited fractures Usually cases belonging to the first group are identified by the method of trial and failure, occasionally by the results of previous experience Operation is indicated in the former group primarily to correct deformity, in the latter group, nonunion itself is the indication In the first group, it is the rule that union will occur, if reduction is maintained, independently of the type of material introduced for fixation, in the second, there are grounds for believing that an autogenous bone graft is superior to anything else Thus, in cases in the first group, the choice of the splint will be determined by the mechanical advantage which the type chosen offers In spiral fractures, silver wire or Parham-Martin bands may meet all indications, transverse fractures may require Lane plates or, possibly, intramedullary pegs of boiled ox bone With the second group, however, the invigorating influence of fresh, osteogenic cells in a living autogenous transplant, appears to play a part that no inanimate material can supplant It has been proved that, while the deeper portions of such bone transplants, removed from contact with an efficient blood supply, die, many of the superficial cells, being bathed in the nutrient plasma of the contiguous tissues, survive and thus form the centers from which regeneration of the transplant, and the supposed stimulation of the inactive osteoblasts at the site of nonunion, proceed While the foregoing statement is probably representative of the consensus of current ideas on this subject, there is evidence which suggests that perfect apposition and fixation are the paramount requirements, and that the apparent stimulating effect of a living autogenous transplant is merely an apparent effect and not real The autogenous transplant has been accorded a second advantage in that it has not been regarded as a foreign body in the same sense as a steel plate or a piece of silver wire Most autogenous transplants heal in place without destructive reaction, many of the metallic splints require subsequent removal On the whole, it may be safely concluded that the essentials of the internal fixation of fractures are now established, further development is likely to be in the direction of the refinement of methods

FATALITIES FROM LOCAL ANESTHETICS

Nothing in medical practice is more serious than the death of a patient within two or three minutes after the injection of a local anesthetic especially when the patient is in excellent health except for a condition requiring some minor operation In view of the frequent employment of local anesthesia, it is apparent that even though the relative number of such accidents is low, in the aggregate the problem merits serious study Efforts to reduce the dangers arising from the administration of local anesthetics have been hampered by limited knowledge as to the cause and mechanism of these unfortunate occurrences From time to time appeals have been made to the profession at large to report the clinical manifestations following the injection of a toxic anesthetic but the response has been poor The Council on Pharmacy and Chemistry therefore asked the Section on Laryngology, Otology and Rhinology to appoint a special committee to make a comprehensive study on the use of anesthetics in nose and throat work The summarized report of this committee appears elsewhere in this issue As is pointed out, the occurrence of twenty deaths in the personal experience of 100 operators shows that the subject deserves more earnest attention Real progress, however, can be made only if cases are reported promptly and with attention to the factors that are in question As an illustration of the immediate practical benefit that could follow this inquiry, it is worthy of note that a fourth of the deaths so far reported to this section arose from mistake in solutions These can probably be avoided by preparing the cocain solution only as needed from tablets colored with a distinctive dye so that the tint of the solution at once would call attention to the drug and its concentration Physicians are urged to cooperate by reporting cases of idiosyncrasies, to the end that further study will result in definitely establishing the causes of sudden death and that a better understanding may be attained as to the proper technic and proper choice of local anesthetics for each particular class of cases

THE ALLEGED MECHANICAL FACTORS IN THE PRODUCTION OF ALTITUDE SICKNESS

Although Paul Bert, as early as 1878, furnished clear experimental proof that the abnormal symptoms and physiologic dangers experienced by persons at considerable altitudes are due to imperfect aeration of the blood with oxygen, this chemical theory of altitude sickness did not find universal acceptance The Italian physiologist Mosso, who made many experiments in the high Alps, developed the acapnia hypothesis, which attributed many of the symptoms to a lack of carbon dioxid, while the Bernese physiologist Kronecker invoked mechanical factors as the cause of mountain sickness [1] The latter investigator believed that a diminished atmospheric pressure brings about disturbances in the pulmonary circulation, quite overshadowing the partial reduction of the oxygen in the effect on the organism At Kronecker's suggestion, Rosendahl [2] placed animals under reduced barometric pressure until severe symptoms appeared, whereupon he restored the pressure with nitrogen gas and observed a revival of his experimental subjects This outcome made it appear, indeed, as if the lack of oxygen were of secondary consideration at most under the conditions instituted to imitate the low barometer of high altitudes A repetition of the investigation by Rippstein [3] in the physiologic institute at Berne has at length brought the results in harmony with the current belief that the essential cause of altitude sickness is lack of oxygen A mechanical influence of barometric environment on the pulmonary vessels does not manifest itself except when extremely low atmospheric pressures are reached

THE NURSING PROBLEM

In his series of articles on Central and South America, the first of which appears in this issue of THE JOURNAL, Dr Mayo calls attention to the nursing problem as he witnessed it in the Canal Zone He speaks as one who has intimate knowledge of the value of the trained nurse and also as one who has observed the serious effects of the shortage of nurses for the general public He emphasizes, as THE JOURNAL has done, the fact that a highly trained nurse is not necessary in the vast number of cases of ordinary illness What is needed in such cases is an intelligent woman who has knowledge of the ordinary elementary facts of hygiene and care of the human body combined with good common sense As Dr Norman Bridge recently said in his commencement address before the graduates of Rush Medical College "Any bright girl can be taught in sixty days to take temperature, pulse and respiration accurately, to prepare and administer invalid diet, to administer drugs in numerous ways to give baths and fomentations, and attend to the personal wants of the invalid and to keep accurate records of the patient, and of her own doings"

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATIO PUBLIC HEALTH, ETC)

ILLINOIS

Clinics—Under the charge of Dr Clarence W East, Springfield, head of the division of child hygiene of the state board of health, twenty-two clinics for crippled children have been established in Illinois with a total attendance of 1,600

Interest in Chiropractor Injunctions—As a result of a recent editorial in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, the Department of Registration and Education of the State of Illinois has received inquiries from New York, Ohio Indiana, Missouri, Oklahoma, Rhode Island and South Carolina, relative to the methods pursued in securing injunctions against unlicensed chiropractors

Chiropractor Fined—K H Mandel, a chiropractor at Nashville, was arrested by the Department of Registration and Education of the State of Illinois, for practicing without a license and on July 19 was fined $300 and costs which he paid Mandel was originally located at Mascoutah, St Clair County One of the inspectors of the department found him practicing there without state authority and filed seven informations against him in one of the courts of St Clair County Mandel heard of this and fled from St Clair County before the sheriff could get service on him His whereabouts were unknown for a few weeks but he was again located in Nashville When arrested, he seemed very much surprised that the state of Illinois should undertake to stop him in his practice He appealed to friends, to the officers of the department and finally wanted to plead guilty, pay a fine of $200 and go ahead and practice This offer was declined He then said he would fight the case, but when it was called for trial, he had no desire to fight, and pleaded guilty State's Attorney House of Washington County was active in the prosecution of this case

Chicago

Personal—Dr Frank Allport has recovered from an illness of several weeks and has returned to Chicago——Dr Norman Bridge is convalescent after an illness of more than a month

Sells Medical Diplomas—It is reported that a Japanese, named T'Aso, recently pleaded guilty in court of selling certificates of the Chicago Hospital College of Medicine for $250 each A raid of T'Aso's room is said to have uncovered sixteen blank diplomas, seals, stamps and other paraphernalia

INDIANA

New Hospital—The Cass County commissioners have authorized the hospital board to purchase grounds for erecting a county hospital at Logansport at a cost of $100,000

Physician Exonerated—In the suits filed against Dr Elbridge G Ricker Monticello, for his alleged failure to report cases of smallpox based on the affidavit of Dr Henry W Greist, Dr Ricker has been completely exonerated

KENTUCKY

Correction of Speech Defects—As the result of a two weeks school for correction of speech defects conducted by the Louisville Board of Education and given to teachers in Louisville public schools, two white teachers and one negro teacher are to be selected to conduct the course for the benefit of children so afflicted

McCormack Memorial—At a recent conference of city and county health officers of Kentucky a movement was inaugurated to establish as a token of friendship and esteem a memorial of the labors and activities of Dr Joseph N

McCormack, Bowling Green, the originator of the latter-day public hygiene and author of virtually all the health laws which have been incorporated into the statutes of the state and an indefatigable worker on the general betterment and uplift of the whole social fabric It is proposed to have made a life-sized portrait of Dr McCormack to be presented at the annual meeting of the Kentucky State Medical Society

Personal—Dr John Walker Moore has recently been elected professor of research medicine in the medical department of the University of Louisville on an all-time basis ——Dr Frederick A Stine Newport, was sworn in July 12 as a new member of the state board of health, succeeding the late Dr Isaac A Shirley, Winchester —— Dr Oscar Dilley was sworn in on the same day as a member representing the state board of pharmacy ——Dr Percy K Holmes has been placed in charge of the new department of public health and hygiene of the University of Kentucky, Lexington ——Dr Edward J Murray formerly superintendent of the Blue Grass Sanatorium Lexington, has been appointed superintendent of the Hazelwood State Tuberculosis Sanatorium Louisville ——Drs J C Sullivan, Mayfield and Thomas B House, Hopkinsville, assistant physicians at the Western Kentucky Hospital for the Insane, Hopkinsville have resigned ——Dr Louise B Miller third assistant physician in the institution has been succeeded by Dr Mary C McClelland, New York ——Dr Lindsey Morrison, West Point, has been appointed physician at the Frankfort Reformatory, succeeding Dr Richard H Moss, Hodgenville

MAINE

Centenarians in the State—The weekly news letter of the Maine Department of Public Health of July 5 is devoted to Maine centenarians Six persons died in Maine during 1919 who had attained the age of 100 years or more and since 1892, when Maine was admitted to the registration area there have been 154 deaths of centenarians, an average of five deaths annually, the largest number in a single year was twelve in 1916, while during 1904 1913 and 1917, the death of only one centenarian was reported

MARYLAND

Seek Aid in Securing Physician—The state board of health has been called on by V M Moreland of Millersville, Anne Arundel County, to aid the citizens of that section in getting a physician to establish residence and office in that community There is not a physician within a radius of 9 miles of Millersville except the medical officers at Camp Meade

Health Officers Tour State—State health officers have adopted a new policy of canvassing the state more thoroughly and more frequently that they may become acquainted with the county officials and come in more direct contact with health problems confined to particular communities At present nearly every officer, including Dr John S Fulton, secretary of the board is in some section of the state either on health work or studying conditions Dr Fulton has for some time been helping to work out a system which will give one or two Red Cross nurses to every county in Maryland

MASSACHUSETTS

Personal—Dr Charles E Perry Northampton, has been appointed county treasurer to fill an unexpired term

Social Service Courses—The American Red Cross in order to meet the need of the U S Public Health Service is offering courses in psychiatric social work at Smith College Training School for Social Work Northampton and in medical social service work at the School for Social Work Boston At the former there is a tuition fee of $50 but the tuition at the Boston school is free

Child Welfare Station Established—A public clinic and child welfare station was established at Fitchburg early in June and since that time eighty babies have been registered Plans are now in progress to open a second station at the police station on Daniel Street Dr Herbert Jacques will be on duty at the new station assisted by Miss Dorris Halloran of the Visiting Nurse Association

MONTANA

Health Officers Meet.—At the annual meeting of the Montana Public Health Association held in Helena July 11 and 12 the following officers were elected president Harry Call vice president Dr Albert R Marco Miles City secretary Dr William F Cogswell Helena and the following officers were elected by the public administrative section of the association president Dr Harmon T Rhoads Choteau vice president Dr George A Lewis Roundup, and secretary Dr John J Sippy, Helena

New State Officers.—The forty-second annual meeting of the Montana State Medical Association was held in Helena July 14 and 15 under the presidency of Dr Edward M Larson Great Falls Billings was selected as the next place of meeting and the following officers were elected president Dr Creswell T Pigot Roundup vice presidents Drs Patrick H McCarthy Butte Louis H Fligman Helena and Harry J McGregor Choteau and secretary-treasurer Dr Elmer G Balsam, Billings (reelected)

NEW HAMPSHIRE

New State Officers—At the annual meeting of the New Hampshire Medical Society the following officers were elected president Dr Alpha H Harriman Laconia, vice president Dr Charles S Walker Keene secretary-treasurer and delegate to the American Medical Association Dr Dennis E Sullivan, Concord, alternate Dr Herbert K Faulkner, Keene

NEW JERSEY

New State Board Officers—At the meeting of the state board of health at Trenton, for reorganization Dr J Oliver McDonald Trenton was elected president and Dr Henry Spence Jersey City, vice president

Bergen County Hospital—Building is now in progress on two new hospital pavilions one for tuberculosis and one for contagious diseases These two units with equipment from a recent appropriation of $300 000 by the Bergen County Board of Freeholders will be a substantial addition to the present County Hospital group They are the result of a well developed plan formulated by the Board of Freeholders medical board and county medical society in conjunction with an advisory board consisting of a number of citizens of the county

NORTH CAROLINA

Licenses Issued—At the recent annual session of the state board of medical examiners in Raleigh seventy-four were licensed on examination and forty-three by reciprocity Twenty-five second year students took the examination on the primary branches ——Forty-three states have established reciprocal relations with North Carolina

Examiners Elect Officers—The board of medical examiners recently elected at the annual session of the state medical society met recently and organized electing the following officers president Dr Lester A Crowell Lincolnton, secretary-treasurer Dr Kemp P B Bonner Morehead City examiner in anatomy and embryology Dr Lester A Crowell Lincolnton, in chemistry hygiene and physiology Dr William M Jones Jr Greensboro in histology bacteriology and pathology Dr Clarence A Shore Raleigh in surgery Dr Lucius N Glenn Gastonia in materia medica therapeutics and pharmacology Dr John G Murphy Wilmington in practice of medicine Dr William P Holt Duke and in obstetrics gynecology and pediatrics, Dr Kemp P B Bonner, Morehead City

NEW YORK

New Hospital—A new community hospital is to be built at Dansville and $100 000 has been raised for that purpose

State Buys Radium—The state of New York has purchased 2½ grams of radium to be used in the research work in the State Institute for Malignant Diseases Buffalo The radium was obtained from carnotite ore found in the Colorado desert

Typhus Precaution Holds Up Steamer—The Cunard steamer *Imperator* which arrived from Cherbourg, July 11 was held in quarantine because it is alleged the steamer failed to comply with the quarantine regulation at Cherbourg Some of the steerage passengers who came from countries where typhus fever is epidemic were sent to Hoffman Island for observation

New York City

New East Side Clinic—A free clinic and dispensary for children has been opened at 26 Roosevelt Street by the American Free Milk and Relief for Italy The clinic will be conducted by Dr Francesco Fortunato assisted by a nurse and voluntary workers

Irrelevant Charges Quashed — Supreme Court Justice Squiers struck out as irrelevant and scandalous all but twelve of the 111 paragraphs contained in a suit brought by an attorney against Dr George B Wix, Manhattan, to recover $7,500 for attorney's fees

Physician Convicted of Manslaughter—A sentence of from three to fifteen years has been imposed on Dr Julius Hammer, who was recently convicted of manslaughter in the first degree following the death of a woman on whom he is alleged to have performed a criminal operation

Rest Home for Nurses—A rest home for nurses who have served with the Red Cross, Army, Navy or U S Public Health Service has been opened at Bay Shore, L I, under an appropriation by the national headquarters of the American Red Cross It has accommodations for twenty-six nurses seeking relaxation after war or epidemic work

Appropriation to Guard Against Epidemics—Health Commissioner Royal S Copeland has obtained from the board of estimate an appropriation of $80,000 to prepare against possible epidemics of smallpox, cholera, plague and typhus such as are raging in parts of Europe In urging that the appropriation be made immediately Dr Copeland stated that several cases of smallpox had been discovered among passengers on incoming vessels, and that while there is no imminent danger, conditions are serious enough to warrant immediate action

Classes for Crippled Children—A request was made for $258,245 for the maintenance of classes for crippled children in the public schools This amount was reduced by the board of estimate to $44,000, and the number of classes has had to be reduced from the thirty-six requested to nine Provision has been made for five additional classes for children with speech defects in the elementary schools and for three additional classes in the high schools A class for the instruction of prospective teachers for correction of speech defects has been allowed in each of the training schools for teachers

Physician Sues to Test Dry Law—Dr Melville A Hays claiming that 100 liquor prescription blanks every three months is not at all times sufficient for legitimate practice on July 20, obtained an order from Federal Judge John C Knox, through his counsel, Thomas F Franklin requiring the Federal Prohibition Director for the state of New York to show why he should not issue additional blanks to Dr Hays Judge Knox declared in the federal district court that he had no jurisdiction in the case of Dr Hays, and denied his petition for a new supply of blanks, inasmuch as he had used three books of 100 blanks in February March and April When he applied for the fourth book in May it was refused In upholding the action of the federal prohibition director, Judge Knox said the way to obtain relief was to file a suit in equity and if this warranted it the court could then grant the request made on behalf of Dr Hays

The Hammer Case—The secretary of the Bronx County Medical Society writes to the effect that the item in THE JOURNAL two weeks ago, to the effect that four hundred physicians had signed a petition asking for clemency in the case of Dr Julius Hammer was not correct, he sends the following resolutions, which were adopted by the Committia Minora of the Bronx County Medical Society and sent to the district attorney for his information

A special meeting of the Comitia Minora of the Bronx County Medical Society was called this day at the office of the Secretary

This action was taken in view of the publicity that was given to the case of the People vs Dr J Hammer and the appearance of the names of several of the members of the Bronx County Medical Society, in the newspapers in connection with this case

The following resolutions were adopted at this meeting and the Secretary was requested to forward them to the office of the District Attorney for his information

1 That Dr J Hammer is not and never has been a member of the Bronx County Medical Society

2 That no member is authorized to use the name of the Society in any way in connection with this case

3 That the matter of Dr J Hammer's conviction has never come before the Society or the Comitia Minora for discussion previous to this date

4 That the Bronx County Medical Society through the Comitia Minora desires to go on record as upholding the laws of this state and country as interpreted by the courts

OHIO

Personal—Dr Frances M Hollingshead, Cincinnati, director of the Division of Child Hygiene in the Ohio State Department of Health, has arrived in Buffalo to take up her duties as director of the Buffalo foundation

New Medical Journal—The first issue of the *Bulletin of the Academy of Medicine of Cleveland* was issued July 9 It voiced the opposition of the academy to compulsory health insurance for Ohio, chiefly on the grounds that it has proved a failure in England and Germany

Physicians in Trouble—Dr William A Charter, Marion, recently discharged from the Ohio State Penitentiary after winning a new trial, is said to have been returned to the penitentiary, July 3, following a second conviction of the performance of an illegal operation——In the case of George F Lee, Sandusky, charged with violation of the Harrison Narcotic Law, the jury is said to have found the accused guilty, and he was sentenced to pay a fine of $1 000 and costs, and to serve a term of three months in the Richmond County Jail ——The federal prohibition director announces the revocation of the permit to prescribe liquor for medicinal purposes issued to Dr Charles F Hera, New Richmond——B W Pearce charged with violation of the Harrison Narcotic Law, is said to have pleaded guilty, June 18, and to have been sentenced to imprisonment for one year in the United States Penitentiary, Atlanta, Ga

OREGON

Personal—Dr Philip L Newmyer, Chemawa has been employed by the state board of control as assistant physician at the State Tuberculosis Hospital——Dr Edwin G Kirby, Elgin, has purchased an interest in the Grande Ronde Hospital, LaGrande

New State Officers—At the annual meeting of the Oregon State Medical Association held June 2 to 5 the following officers were elected president and delegate to the American Medical Association Dr Joseph A Pettit, Portland, president-elect, Dr Clarence J McCusker, Portland, vice presidents Drs Benjamin A Cathey Condon, Harvey J Clements, Salem and Richard H Wellington, Portland secretary Dr Raymond E Watkins Portland, and treasurer, Dr Jessie M McGavin, Portland (reelected)

PENNSYLVANIA

Personal—Dr Larry D Sargant has been appointed chief of the State Tuberculosis Clinic at Washington——Dr Frank F D Reckord Harrisburg, for five years associate director of the tuberculosis division of the Pennsylvania State Department of Health, has resigned and will resume practice

Philadelphia

Personal—Dr Morris Smith has been appointed laryngologist, and Dr John D Donnelly pediatrician at the State Tuberculosis Clinic——Dr William W Keen, professor emeritus of surgery at the Jefferson Medical College president of the International Surgical Society in conference at Paris, presided at the opening sessions

Portable Health Clinic Established—The Philadelphia Health Council and Society for the Prevention of Tuberculosis has established a portable health clinic in conjunction with the Department of Public Welfare, ten of whose recreation buildings are being used as centers Dr Robert A Schless is conducting the clinic for boys and Dr Jeanette H Sherman the clinics for girls

Jefferson Medical College to Dedicate Memorial—The Alumni Association of Jefferson Medical College has planned to dedicate a memorial to the graduates who gave their lives in the service of their country during the great World War A large bronze tablet, bas-relief, 5 feet high by 4 feet wide, appropriately decorated and engraved with the names of the men who gave their lives in the service, is to be placed in the main entrance to the college building at Tenth and Walnut streets The dedicatory ceremonies will be held in the college building on Thursday evening, October 7, at 8 p m Addresses will be made by the Hon William Potter, president of the board of trustees, Jefferson Medical College, Dr S Solis Cohen president of the Alumni Association Jefferson Medical College, and by representatives from the U S Army and Navy Medical Departments Jefferson Medical College was represented during the World War by 1,147 of its graduates in the Army and Navy Medical Service Sixty-five per cent of the graduates for the five years preceding 1918 were in the service and 60 per cent for seven years preceding 1918 served in some department of the Army or Navy In the class of 1916, 103 were represented, in the class of 1917, ninety-four were represented and in the class of 1918, ninety-one were represented Four hundred and thirty-one were represented in the student army training corps 398 were in the Army and thirty-three in the Navy Graduates from every state in the Union were represented in this

number and representatives of every class for the last forty-four years were included in the service Twenty-five graduates gave their lives for their country

SOUTH CAROLINA

District Society Meeting—The annual meeting of the Eighth District Medical Association was held in Allendale July 2 Bamberg was selected as the next place of meeting, and Dr Joseph S Palmer, Allendale, was elected president, and Dr G W I Loadholt, Fairfax, vice president

Personal—Paul E Knotts Gaffney has assumed his duties as health officer of Cherokee County——Mr Clarence E Smith, who resigned recently as city health officer of Columbia, on leaving for his duties as health officer of Greenville was presented by the City Board of Health of Columbia with a silver filigree tobacco jar

TEXAS

Bubonic Plague—The state department of health and the U S Public Health Service working in cooperation have practically completed the bubonic plague survey in Jefferson County and plan to extend their work to other sections of the Texas coast quarantine area No new cases of bubonic plague have developed in Beaumont

Health Survey of Schoolchildren—A survey of the health of schoolchildren in a north Texas town has recently been completed by Miss Pearl N Heyer R N public health nurse of the Texas Public Health Association Examinations of 729 children were made by Miss Heyer, assisted by local physicians and 1 656 defects were found Of these children, 297 had enlarged tonsils 31 submerged tonsils, 122 disease of the eyelid, 97 adnoids, 150 needed glasses, 136 had defective hearing, 385 needed dental care, 119 had diseased gums 20 were more than 10 pounds overweight, and 299 were 5 pounds or more underweight

WISCONSIN

Personal—Dr George V I Brown Milwaukee has been appointed president of the Tri-State District Medical Society succeeding Dr Walter B Helm Rockford deceased Dr Joseph S Evans, Madison, has been elected vice president, succeeding Dr Brown

Fine Collected—The fine of $6 000 imposed three months ago on Dr John G Barnsdale Madison, when he was sentenced to three years imprisonment in the federal penitentiary Fort Leavenworth, Kan, for an extensive illicit drug traffic, is said to have been collected, June 21, by United States Marshal Frank O Connor, after action had been taken to foreclose on the property of the physician

CANADA

Personal—Dr Edward C Arthur Vancouver, has been appointed medical officer of health of British Columbia——Dr George R Cruickshank Windsor, has been appointed director of laboratories in the department of public health Toronto succeeding Dr Albert G Fleming, who has accepted a position in Ottawa

Care of Exservice Men—Statistics recently compiled show that 8 676 exservice men have been treated in sanatoriums maintained by the department of soldiers' civil reestablishment Of these, 6 636 have been discharged as cured or in quiescent condition There were at the time of the report 2 040 patients undergoing treatment, of whom 158 had had previous treatment, a percentage of 7 7

Venereal Clinics in New Brunswick—The bureau of health of St John plans ten venereal clinics throughout that province These clinics will be in charge of physicians who have special training in the diagnosis and treatment of such diseases The clinics are to be established at St John, Monckton Chatham Bathurst, Campbellton Edmunston, Grand Falls, Woodstock Fredericton and St Stephen

University News—The Provincial Red Cross of British Columbia has offered the University of British Columbia a Red Cross Chair of Public Health The Red Cross will undertake to pay the salary of the professor of public health for three years The activities of the department will be province-wide in scope and the course will extend over five years——In the survey prepared by the Faculty of Medicine of the University of Toronto for the Rockefeller Foundation Ontario leads with one physician to every 905 population British Columbia comes next with one to 905 Nova Scotia is third with one doctor to every 908 and Manitoba fourth with one to every 1 098

Red Cross Peace Program in Nova Scotia—July 12 two great public health caravans planning a tour of Nova Scotia left the parade in front of the city hall Halifax under most auspicious circumstances Each of these caravan consisting of Red Cross ambulances motor trucks and touring cars is equipped with moving picture and lantern slide apparatus and has a personnel of six physicians one dentist and a corps of nurses They will spend six weeks in reaching the coast towns and fishing villages most in need of public health assistance and medical relief work One caravan is going north through Antigonish and on to Sydney, Cape Breton while the other goes south through the Evangeline country to Yarmouth returning along the east coast

GENERAL

Missouri Valley Meeting—The thirty-third annual meeting of the Medical Society of Missouri Valley will be held in Omaha September 6 and 7 under the presidency of Dr Charles Ryan Des Moines Iowa The organization will be the guest of the Omaha-Douglas County Medical Society

New Officers for Chattahoochee Society—The twentieth annual session of the Chattahoochee Valley Medical and Surgical Association was held at Warm Springs Ga July 13 and 14 and the following officers were elected president, Dr William C Gewin Birmingham Ala vice president, Dr Thomas Neal Kitchens Warm Springs Ga and secretary-treasurer, Dr William J Love Opelika, Ala (reelected)

Civil Service Examinations—The United States Civil Service Commission has announced examinations for the following positions at the times stated

Aug 24 1920 associate in clinical psychiatry and psychotherapy to fill vacancies at St Elizabeth's Hospital Washington D C and similar vacancies at $2 500 a year and maintenance Bachelor degree and medical degree prerequisites

Aug 31 1920 pharmacologist in the Public Health Service Washington D C and other vacancies at $3 000 a year qualifications M D degree and three years postgraduate work in experimental pharmacology and physiology required

Mine Rescue Contest—The International First Aid and Mine Rescue Contest will be held September 9 to 11 at Denver under the auspices of the Bureau of Mines The contest will be open to all bona fide first aid and mine rescue teams connected with mining and metallurgical companies of the United States Canada and Mexico Prizes of gold medals, cups and banners will be awarded to teams most efficient in the art of saving human lives This meeting will cover the entire mining industry in North America

Anesthesia Society Activities—The National Anesthesia Research Society announces that its research workers will present the results of their experiments and observations at their annual meeting to be held at Pittsburgh October 4 to 8 at which prizes of $200 have been offered for the best papers submitted——The Toledo Society of Anesthetists has been organized with a 100 per cent enrolment of the recognized anesthetists of the city——It is said that fourteen county societies in California have adopted resolutions within the last four months favoring the limitation of the administration of anesthesia to regular licensed physicians and surgeons

Bequests and Donations—The following bequests and donations have recently been announced

Hospital of the Protestant Episcopal Church Philadelphia and Pennsylvania Hospital each $200 000 trustees of the University of Pennsylvania Philadelphia Orthopedic Hospital Woman's Hospital and Children's Hospital each $100 000 and Philadelphia Polyclinic Hospital $50 000 by the will of Mrs Harriet Blanchard

Methodist Episcopal Hospital Brooklyn General Hospital each $25 000 Bridgeport (Conn) Hospital $10 000 by the will of William W Armstrong New York City

Bowdoin Medical School Brunswick and Portland Me $1 000 by the will of Dr Frank Byron Brown Boston of the class of 1897

New York Post Graduate Medical School and Hospital donations of $25 000 from Ida C Pott Livingston N Y $20 000 for the endowment fund from Mrs F F Cloe New York City $10 000 to endow a bed in memory of Eben Briggs Thomas and $1 000 from Mrs Clarence M Hyde

Harvard University for the purpose of fostering the knowledge of healthful nutrition the residue of an estate valued at $120 573 after the payment of an annuity of $3 600 to his widow by Dr Horace Fletcher

Presbyterian Hospital and Old Men's Home Philadelphia the residue of an estate of $114 000 after creating several small trust funds by the will of Theodore D Rohrman

St Agnes Hospital Philadelphia $1 000 by the will of William Hall

For the new hospital for Marshall Lodge (Masonic) Home and Retreat Lynchburg Va a donation of $20 000 by Mrs Max Guggenheimer Lynchburg

Appeal for Chemicals for Purifying Water Supply—The failure to obtain necessary purifying chemicals is seriously affecting the water supply of a large number of cities

throughout the United States, and urgent appeals to remedy the situation are being made to the U S Public Health authorities at Washington State health officials in New York, Michigan, Ohio, Pennsylvania, Rhode Island, Minnesota, Virginia and Connecticut have sent emergency appeals to the Public Health Service in an effort to have railroad shipment priorities established for the movement of alum and chlorin, which chemicals are used in ridding water of dangerous disease germs The chief source of supply of alum from which bauxite is produced is Little Rock, Ark, and the monthly requirements of this chemical for the United States are about 500 cars Due to congested railroad traffic an acute shortage of these chemicals has existed for several months The facts have been placed before the Interstate Commerce Commission in order that special orders may be issued to railroads for setting aside cars for transportation of these chemicals "Officers of the U S Public Health Service view the situation with alarm as do health officers throughout the country," said Surg-Gen Hugh S Cumming 'The summer is always a critical time in dealing with waterborne diseases, for the demands made on municipal water systems are then so great that usually every available source of water has to be utilized In very few places in the United States have large cities a water supply which does not need to be artificially purified before it is safe for drinking purposes, the usual method being mechanical filtration with alum and disinfection with chlorin With these chemicals practically unobtainable, due to the railroad situation, it may soon become impossible to furnish pure water in some of the largest American cities During the last ten years the purification of drinking water with alum and chlorin has been the greatest single factor in the control of typhoid fever among the civilian population Unless the railroads find it possible immediately to transport the necessary materials to the cities, the most serious consequences in the form of epidemics of typhoid fever are to be apprehended"

LATIN AMERICA

Pasteur Institute in Northern Brazil—The *Amazonas Medico* brings word of the foundation and inauguration of the Instituto Pasteur at Manaos Dr Astrolabio Passos has been in charge of the organization of the institution and continues as director, having been given regimental leave for the purpose He is at the same time director general of the university and member of the state legislature

Personal—Dr J F Arteaga was awarded the Suarez Bruno prize by the Academia de Ciencias at Havana for his work with the title Sanitary Malariology"——Prof Bosch Arana of Buenos Aires, as exchange professor at Montevideo recently described his extensive work in adapting amputation stumps to activate prostheses, illustrating his remarks with moving picture records of what he has accomplished

Argentina Restricts Sale of Acetylsalicylic Acid—The Argentina health department has decided to restrict the sale of acetylsalicylic acid (aspirin) except when prescribed by a physician For six months druggists will be permitted to continue the unrestricted sale of acetylsalicylic acid or medicine containing it already on the local market, but no new compound may be introduced, and after the expiration of six months the sale of the old brands will be prohibited except on the requisition of an authorized medical practitioner

FOREIGN

Czechoslovaks Establish Journal—A new scientific review entitled *Czech Annals for Dermatology and Venereology* has been established in Czechoslovakia and is the organ of the Society for Combating Venereal Disease

Development of Japanese Red Cross—Dr A Minagawa, a member of the board of governors of the League of Red Cross Societies reports that the membership of the Japanese Red Cross, which in 1898 was estimated at over 500,000, was at the end of June, 1919, 1,879,860 The society issues a monthly journal, the *Haqiai*

Retirement of Gimeno—Having reached the age limit, Dr Amalio Gimeno y Cabañas, professor of pathology at the University of Madrid, senator, at one time minister in the cabinet, and author of several popular textbooks, was given an ovation in the university amphitheater at a special gathering for the purpose He was presented with a medallion and a banquet followed

St George's Hospital Pupils' Register—The dean of St George's Hospital Medical School London announces that the Pupils' Register of the hospital and school is ready for the press The book consists of a transcription of all the names, 6 500 in number, on the pupils' register from 1872 to 1915, with annotation notes on all of the men about whom it has been able to obtain data The foreword has been written by Dr George C Peachey, London, on "Medical Education in the Metropolis in the Eighteenth Century" The dean will be glad to have the names of intending subscribers The book will cost not less than $5 25 and may cost $7 50

Personal—The University of St Andrews, Scotland, has conferred the degree of LL D on Dr Leon Frederic, for nearly thirty years professor of pathology in the University of Liege, Belgium, Mr W J Matheson, president of the biologic laboratory of the Brooklyn Institute, and scientific adviser in chemistry to the Board of Health of the City of New York, and Dr Norman Walker, inspector of anatomy for Scotland and direct representative of the profession in Scotland on the General Medical Council——Sir Clifford Allbutt University of Cambridge, M Roux, former director of the Pasteur Institute, Professor Heger, Brussels and Professor Marchiafava, Rome, have been elected honorary members of the Association of European Physicians——Dr John G Adami vice chancellor of the University of Liverpool and professor of pathology and bacteriology in McGill University, Montreal has been elected to an honorary fellowship in Christ's College Cambridge——Cambridge University has conferred the honorary degree of LL D on Dr Simon Flexner director of the laboratories of the Rockefeller Institute for Medical Research

Deaths in Other Countries

Dr **Arnaldo Vieira de Carvalho**, professor of surgery in the Faculdade de Medicina of São Paulo, Brazil, and one of the leaders in the profession in that country——Dr J Bucquoy, dean of the hospital physicians of Paris, at one time president of the Academie de Medecine, author of several works on heart diseases and duodenal ulcer, aged 91 He had attended the meetings of the academy to the day before his death, which was due to a street accident——Dr A Ritti, a Paris alienist and writer on insanity, aged 76——Dr A Levertin, of Stockholm an authority on balneology and mechanotherapy, aged 77

CORRECTION

Bequest for Parkin Prize—In the announcement of the Parkin prize made in THE JOURNAL of June 19 page 1725 it was stated erroneously that the bequest was made to the Royal College of Surgeons, Edinburgh This should have read to the Royal College of Physicians, Edinburgh

Government Services

Public Health Service Campaigns for Infant Welfare

The U S Public Health Service is carrying on a special campaign throughout the country in infant welfare work A series of thirty-three articles on the care feeding, and general requirements of infants has been prepared by the Public Health Service and is being printed by over 100 leading newspapers throughout the United States Mothers are urged to read the articles as published and cut them out of the newspapers for future reference

Hospital Patients Publish Newspaper

Patients of the U S Public Health Service Hospital at Fort Bayard New Mexico are publishing a weekly newspaper known as the *Mountain Breeze* The paper was first printed on a multigraph with but 200 readers The paper met with approval of the patients and hospital officials and a few weeks later a staff was organized In a short period of time the paper has increased its circulation to 700 copies and in size to twelve pages, containing much information and news of value to the patients in the hospital and the community in general

The purposes of the paper, aside from its news value are to unite the patients in their own interests and give them interesting work in the preparation of items for the paper and occasionally cause a smile to those who have dark and gloomy hours The paper is in charge of James D Hill as editor No government funds are used in the printing of the *Mountain Breeze* and all articles are written by the patients and the publication is entirely managed by hospital patients

Foreign Letters

July 4 1920

Competitive Tests in the Medical School

The directing body of this institution has ordered that hereafter vacant chairs will be filled by competing examinations which will include the submission by the candidate of an unpublished thesis a public oral test, practical demonstrations whenever they may be required, and in every case an academic test consisting of a lesson given by the candidate to a group of students before the examining board The candidates will be classified according to the points they score in each test, the one receiving the highest number will be appointed professor and the next one assistant professor Even then the professors will not keep their positions permanently but only for some years Those who have been employed for four years and have given full satisfaction will retain their places without having to pass the tests The only thing to be done now is to determine the requirements that applicants must fulfil in order to be admitted to the examinations Once before the same principle was followed, but because of some irregularities the directing board of the school requested that the appointments should be made by the government More recently, in addition to this method there was adopted (although on a small scale) the optional (unofficial) teaching by means of which any physician so invited by the students could teach any subjects that he wished, after obtaining the permission of the faculty and without receiving any salary The first examination which will be held during the present year, will decide whether in our country this procedure will give better results than those obtained by the selection, from among the group of optional professors, of those who have shown unusual fitness for teaching or by the system of free appointments

A New Children's Hospital

In a few days there will be inaugurated a children's hospital which will be supported partly by the government and partly by private charity This institution will receive a certain percentage of the profits derived from the national lottery The previous government suppressed the lottery system, but it is going to be reestablished only as a concession to those who cannot do without gambling, as the new government does not permit other forms of gambling, in spite of the huge profits derived from it There have already been received several gifts of necessary articles for the new hospital, which will probably be named after the late Dr Liceaga

Invitation to a Journalists' Congress

Through Dr Ocaranza the editors of Mexican medical journals have received a very cordial message from the *Revista Médica del Uruguay* asking their opinion on the advisability of holding a meeting of the medical editors of Latin America Though announced a long time ago by THE JOURNAL in its news section it has not been possible to hold the meeting thus far One of our journals has answered, suggesting that in order to insure the success of the meeting, an invitation be extended to Canadian and American medical editors to participate as the latter have a wider experience and the difference in language is not an obstacle to the solution of problems common to all of them and also because the creation of leagues on purely racial lines occasionally produces ill feeling and misunderstandings which should be avoided for the sake of mankind The publication of medical journals in French in Canada and Spanish in the United States, THE JOURNAL for instance shows that the medical profession is probably one of the groups that can most easily establish cordial relations throughout the whole continent and also that medical Pan-Americanism is feasible to the advantage of all concerned

Personal

Dr Cutberto Hidalgo senator has been appointed undersecretary of the department of state——Other medical appointees are Gen Enrique C Osornio as director of the military hospital and the attached medical school, and Dr F Hurtado as professor of clinical medical therapeutics replacing Dr Ricardo Manuell, who goes to the university to teach clinical medicine (postgraduate), Dr Terres having resigned his position——Dr Eliseo Ramirez has been appointed professor *libre* of surgical pathology in the school of medicine——Don Roberto Medellin a pharmacist has been made director of the school of chemical industries

BELGIUM

(From Our Regular Correspondent)

June 23, 1920

Infant Mortality in the Belgian Congo

A scientific expedition to the Congo under direction of Dr Dossin for the purpose of making a study of the sanitary conditions as related to infant mortality has just returned after a period of nine months A voluminous report will shortly be issued but in the meantime it may be announced that the expedition will bear excellent fruit The investigations of Dr Dossin show that education of the negro will result in a considerable increase of healthy children by dispelling some of the many superstitions which are entertained by the natives and above all by improving the conditions of hygiene and nutrition

Death of Debaisieux

T Debaisieux the most eminent and renowned surgeon of Belgium, and emeritus professor of surgery of the University of Louvain died recently Before his death Dr Debaisieux had the gratification of seeing his son appointed to the chair which he himself had held for many years As one of the representative men in the Belgian medical world he was the recipient of marked honors during his life having been elected president of the Societe belge de chirurgie and of the Academie royale de medecine He had many friends in foreign countries especially in the United States and was a corresponding member of numerous foreign societies

Reforms in Medical Education

The Commission for Relief in Belgium assigned the income from one hundred millions of francs to Belgian universities for the development and advancement of higher education In order that the funds may be utilized for the greatest good of future generations of students the scientific societies are making a thorough and impartial study of educational projects The income will permit the universities not only to improve the teaching facilities but also to encourage scientific research On motion of Dr Malvoz, the Academie de medecine recently discussed reforms in medical education with a view to attracting more laboratory workers and thus building up an intellectual group which would maintain the scientific prestige of Belgium

Now the professional training of physicians requires practical and technical knowledge in ever increasing proportions The subjects of examination for obtaining the doctorate of medicine are becoming more numerous and one is obliged to study gynecology syphilography otorhinolaryngology urology and other specialties of which a fundamental knowledge is indispensable to a good general practitioner But with only one diploma for all the young men who are des-

tined for science are obliged to assimilate all this knowledge, even though they desire the title of doctor in order to become assistants, instructors, etc Is this not an opportune time to establish two diplomas? The M D degree would be given after successful termination of a course covering a thorough study of the three branches of medicine This course would be obligatory for all and the diploma would suffice for those who wish to devote themselves to science to anatomy, pathology, embryology, physiology or bacteriology In case a holder of the scientific diploma should desire to practice medicine, he would then have to pass an additional professional examination, covering all necessary technical subjects and the specialties

Dr Swaen broadened the discussion to include more practical methods of teaching the technical branches of medicine The calling of a professor is a sort of apostolate which demands great devotion Personal sacrifice of time is demanded for the training of students in small groups as compared with teaching by lectures ex cathedra, but this is, perhaps, the real solution of the problem To accomplish this it will be necessary to increase the number of professors and to permit organization of teaching faculties on personal initiative

LONDON

(From Our Regular Correspondent)

July 10 1920

Annual Meeting of the British Medical Association

THE FUTURE OF MEDICAL PRACTICE

In the Section of Medical Sociology, Sir George Newman opened a discussion on this subject which was most important in view of the development foreshadowed in a previous letter (THE JOURNAL, June 19 p 1726) He said that the constantly increasing duties placed upon the physician by the state had diverted the whole course of applied medicine from its century old pathway The physician was now mistrustful of what he considered unnecessary intervention and feared the imposition of some cast-iron system, some form of so called 'nationalization," a whole time service which might make him dependent and fettered A larger measure of understanding on his part of central and local government and of the history and on the part of the state and its officers of the development and genius of professional character, was necessary to bring about an improved relation between the two Five outstanding problems now faced the medical profession in its relation to the state 1 We must find a *new unit of health government* At present there was confusion and overlapping because the country had been mapped out five times by different hands for different purposes, such as relief of the poor, sanitary administration, education, insurance act, and war pensions 2 Uniformity of administration was wanted The provision of medical treatment in the home, at the clinic and at the hospital should be brought into proper relation 3 We had no connected hospital system, the relation of hospitals to each other to the contributory clinics and to the insurance system wanted settlement 4 Most important of all was an adequate method of education of the student and the physician A different kind of physician was needed in these times—one with improved training in new subjects—preventive medicine and communal responsibility 5 The physician must be the chief educator of the people in the way of health, and in doing this could not escape his responsibility in problems such as education, recreation, housing, conditions of industry sobriety and venereal disease

Discussing the question from the point of view of medical research, Prof Gowland Hopkins pleaded for a closer cooperation between the laboratory worker and the clinician It was remarkable how largely, in general practice at any rate, the use of chemical methods in diagnosis had been confined to mere tests for albumin and sugar in the urine Much earlier information and more discriminating knowledge concerning renal failure could even now be obtained, say by simultaneous analyses of blood and urine, and on the same lines a better realization of the significance of this or that case of glycosuria So also, estimations of alveolar carbon dioxid tension made simultaneously with determination of the hydrogen ion concentration, or the alkali reserve of the blood are giving precision to knowledge in other kinds of cases These were mere illustrations, but it was important to realize that the so-called micromethods of analysis could be made really accurate, and that many constituents of the blood could now be estimated without inconvenience to the patient Much wider applications of such methods will inevitably arise There was no pathologic condition in which metabolism remains normal, and the great majority of such departures from normality were reflected in some alteration, qualitative or quantitative, of the blood and urine There was, indeed, a mass of chemical information already available which had never yet been applied as it might have been, to the needs of diagnosis, but when the number of laboratory workers (which was absurdly small) was increased, and when the stimulus hitherto lacking, of real contact with clinical material was provided, knowledge and technic available for these particular needs would develop indefinitely

SUBACUTE BACTERIAL ENDOCARDITIS

Dr Libman New York, said that 90 per cent of the cases were due to the nonhemolytic streptococcus, the great majority of the remainder being due to the bacillus of influenza Most often the heart valves showed old and long previous lesions He drew attention to the renal lesion—a glomerulonephritis with partial involvement of the individual glomeruli He described the so-called "bacterium-free" stage occurring in something like a quarter of these patients Renal deficiency anemia, and embolism were the three commonest causes of death, marked browning of the face was not very rare The prognosis was bad, but not hopeless

SURGICAL TREATMENT OF GASTRIC ULCER

Sir Berkeley Moynihan said that gastric ulcer was essentially a secondary disorder The first efforts of the surgeon were to be directed toward discovering the primary source, which most probably lay within the abdomen or in the buccal cavity, after septic infections of teeth, maxillary antrum and appendix had been dealt with, they were to go on to the essential surgical treatment of the ulcer Medical treatment had to be much more rigid and spread over a longer time than formerly He advocated rest in bed, and large quantities of fluid with alkaline drugs rather than starving When medical treatment thus extensively tried had failed, surgery must step in Gastro-enterostomy had come to be the favorite operation, it had given him excellent results when the ulcer was small and situated in the lesser curvature, poor results when the ulcer was large and adherent to the pancreas, and bad results when carcinoma had developed in the base of the ulcer He had abandoned gastro-enterostomy because the results were not good enough for modern surgery It was now only the second-best method Excision of the ulcer with gastro-enterostomy was a good method But he now believed that partial gastrectomy gave the best results, provided the ulcer was suitable for operation at all He briefly described the technic and gave statistics to show that the ultimate results amply justified this radical procedure

Dr Charles H Mayo gave the experience of the Mayo clinic In 95 per cent of the cases, roentgenoscopy could distinguish between gastric and duodenal ulcer There was

a lowering of the free acids and an increase of the combined acids Gastric ulcer was potentially malignant Destruction of the ulcer, along with gastro-enterostomy, was the surgical treatment

CANCER OF THE RECTUM

Mr Ernest Miles described the various modes of spread of the disease, and showed how local increase in size was of less importance than the glandular infection, which was generally recognized as developing in three ascending zones, it was this metastasis which constituted the difficulty in operating It was as important to remove glands discoverible near the common iliac vessels as it was in the analogous case of cancer of the breast to clear the axilla and its contents By a series of diagrams thrown on the screen he showed how, as the glandular geography came to be known, the scope of the operation came to be widened, and how he was forced to regard the abdominoperineal operation as the only radical one

Mr Grey Turner pointed out that the treatment of rectal cancer could never be considered satisfactory as long as the disease was so far advanced as to necessitate operations which left an incontinent anus Improvement could come only through much earlier diagnosis and surgical operation following it He regarded the thorough removal of the growth and surrounding tissues, with 2½ inches of uninvolved bowel above and below, as more important than removal of the upward invasion path The best operation was exploratory laparotomy with colostomy followed by sacral excision

The discussion revealed some divergence of view as to the extent of the radical removal of the rectum Some surgeons upheld the operation advocated by Mr Miles, others thought that some less extensive procedure gave ultimately as good results Some urged that an inguinal artificial anus was essential, others held that every effort should be made to preserve the anus with sphincteric control in its proper situation

EARLY SYMPTOMS OF NERVOUS DISEASE

Dr Henry Head said that early symptoms were often unobtrusive and transitory, and may have impressed themselves so little on the mind of the patient that they were remembered only when a precise and detailed account from the patient was insisted on Many of the early signs of nervous disorder manifest themselves only in mental spheres For example, there might be changes in personality and conduct, and memory defects, such as amnesias, disturbances of sleep, and headache Certain forms of headache could be clearly distinguished, and were of great importance in diagnosis Diagnosis was a threefold process (1) determination of the disturbance of function, (2) translation of such disturbance in terms of the locality of the structural lesion, and (3) the nature of the underlying pathologic process All such names as tabes dorsalis' and general paralysis" should be avoided They did not denote diseases in the strict sense of the word, but were merely shorthand titles for groups of signs and symptoms evoked by the action of *Spirochæta pallida* on different structures of the central nervous system"

PUERPERAL SEPSIS

Mr Victor Bonney said that in nearly all cases of severe puerperal sepsis the streptococcus either alone or in conjunction with *Bacillus coli-communis*, was the predominant organism The original source of the organism in the majority of cases was autogenous and not heterogenous, the zone of skin with the anus as a center being the breeding ground of the organisms He advocated the practical sterilization and shutting off of this part during labor How did the organisms get into the uterus? The most obvious means was by the hands and instruments of the attendant, but at the same time Bonds experiments proved the possibility of inanimate particles passing in the reverse direction of the main stream up into the uterus, and into the peritoneal cavity The ovarian plexus of veins draining from the placental site was the commonest and most important route of infection the phlebitis being accompanied by lymphangitis As to treatment at present there was no surety of defeating the causative organisms by surgery or by direct application of antiseptics He thought however, that the resistance of the body could be raised by vaccines and an attempt could be made to prevent organisms and their toxins reaching the general circulation by means of ligating or excising the ovarian plexus of veins and lymphatics which he had done with success on several occasions

In the discussion which followed Dr Eardley Holland dealt chiefly with the question of prevention He strongly advocated rectal examination and stated that during ten years he had never made a vaginal examination in normal labor

Surgeon-General Gorgas

Surgeon General William C Gorgas who died, July 4, at the Queen Alexandra Military Hospital London, was taken ill some weeks before while passing through this country on his way to the West Coast of Africa to investigate yellow fever During a visit to the hospital, June 8 the king called on him and invested him with the insignia of K C M G in recognition of his services to the British Empire and to the world generally A military funeral, in which the honors rendered to him were those of a British major general was given to him An imposing military procession brought the body to St Pauls Cathedral while a salute of thirteen guns was fired at minute intervals Covered with the Stars and Stripes and a single wreath of white flowers the coffin was borne on one of the gun carriages of the Royal Horse Artillery The Band of the Coldstream Guards played solemn music The generals charger led by a dismounted Life Guardsman, followed the gun carriage The pallbearers included the United States military and naval attaches the presidents of the Royal Colleges of Surgeons and Physicians and of the Royal Society of Medicine, Dr Charles Mayo of Rochester Minn , and the director general of the medical department of the navy The king was represented by Lieut-Gen Sir H Goodwin, director-general of the Army Medical Service, and the government by Dr Addison, minister of health Serbia and Panama, countries which entered into the scientific record of the general, were represented The service ended with the Battle Hymn of the Republic The body is to be taken to America for interment

The Book Crisis

The paper shortage and publishing difficulties still arouse a lively interest M Ducrot in an informative article in the *Revue Scientifique* on the subject of scientific publishing in France showed that if there was a crisis in the publication of literary works this was particularly acute in the case of works on pure science In fact, the elements of book-making have increased considerably in cost as compared to prices before the war compositors and pressmen are paid from three to four times as much as in 1914 the price of paper is five times as great and these factors contribute to make the cost of a book from three to four times as much as before the war Now the income of the intellectual classes the only purchasers of theoretic works has barely doubled while the budgets of public institutions libraries, laboratories etc have been greatly reduced A book even one that constitutes a

veritable working tool, is not a prime necessity It should not, therefore, exceed a certain price, above which it will not sell, and at the present moment, the maximum has apparently been reached

This condition, which constitutes a veritable danger to the advance of science, is not peculiar to France A statistical study by M Fernand Roches in the *Correspondant* discloses the progressive decrease of the number of publications in the principal countries since 1914 Exclusive of periodicals and musical works, the figures show that the number of books published in 1918, as compared to 1917, decreased in France from 5,054 to 4,484, in Great Britain from 8,131 to 7,716, in Italy from 8,349 to 5902, in the United States from 10060 to 9,237, and in Germany from 14,910 to 14,743 The production in 1919 is not yet known, but it was probably less than in 1918

It is interesting to note that the decrease in Italy totaled 2447 books, in the United States 823, in France 570, and in England 415, but Germany, defeated and disorganized, showed a decrease of only 167 works

So far as French medical books are concerned, statistics recently published in the *Bibliographie de la France* indicate that the number of such works, which had suffered a great decrease before the war (from 1,230 in 1910 to 721 in 1914), had again greatly declined in 1915, namely, to 202 works A tendency to improvement was noted in 1916, and again in 1917, when 292 books appeared However, in 1918, a new decline set in which it was believed would be accentuated in 1919, but nothing of the sort occurred and in that year 309 new books appeared

The Insane Asylum at Charenton

Lively protests have been registered with the ministre de l'hygiene, de l assistance et de la prevoyance sociales against his announced intention of converting the old asylum at Charenton, devoted for almost three centuries to the care and treatment of the insane into a maternity hospital in order to relieve the congestion of the Paris maternity wards, which are no longer able to accommodate all applicants The protests emanate on the one hand from the families of the patients at Charenton but above all from the medical alienists of Paris At a joint meeting of scientific societies and professional organizations of psychiatrists, a delegation was appointed to present to the minister of hygiene the objections against the projected change and to seek another solution At a conference between the minister and the committee it was agreed to adopt the following temporary expedient the few patients at present under treatment at the asylum will be installed in one wing of the institution, and the vacant beds will be turned over to the new maternity home, which will thus command accommodations for about 1,000 patients

School Hygiene

The first of the school health centers which the Lannelongue Institute of Social Hygiene is planning to establish in Paris and in other large cities was recently opened under the auspices of M Honnorat, ministre de l instruction publique This center, the prime mover of which is the medical inspector of schools, is first of all a sorting center where children with diseases of the eyes, ears, etc, are referred to the appropriate hospital clinics or private hospitals in the neighborhood, next a treatment center for certain diseases (dental disorders, spinal deformities), it is also a laboratory for the examination of mentally defective or abnormal children, but last and above all it is a center for teaching and close collaboration between the medical profession and the teachers, for the greater good of the pupils From these centers, also the physicians and visiting nurses will set out to give medical attention to children in their homes, to make any necessary inspections regarding the sanitary conditions of their environment, and to give appropriate advice on the improvement of their living conditions

Memorial Tablet for Medical Officers

The society of students and alumni of the Ecole d'application du service de sante militaire at Val-de-Grace is seeking subscriptions for memorial tablets to commemorate the names of medical officers of the regular army who died in active service during the World War The marble tablets will be placed in the arcade at Val-de-Grace, following those erected to the memory of the heroes of former wars The subscription list is in charge of Dr Pasquelle, 8 rue Ballu, Paris

Paris Faculty Election

The council of the Faculte de medecine de Paris has elected Prof Henri Roger as dean of the medical faculty for another term of four years

THE PIRQUET SYSTEM OF NUTRITION

(From a Special Correspondent)

VIENNA, July 1, 1920

To the Editor —It is probably not known in the United States that the name von Pirquet famous for the discovery of the reaction following inoculation with tuberculin toxins—tuberculin test—is now better known in Austria because of Pirquet's system of nutrition This system is described in a three volume work entitled "Pirquets System der Ernährung," and also in a smaller booklet by his chief assistant, Prof B Schick, entitled 'Das Pirquetsche System der Ernährung' published in Berlin in 1919 This system is today widely discussed here People are being fed according to this system—not only adults, but also rachitic children and nurslings It is also used in soup kitchens which have been established under the American Relief Association, which prepare food daily for 288 dining rooms in which 165 000 children receive one meal daily

The unit of nutrition has heretofore been the calory Von Pirquet believes that the calory is not a definite value, and he has adopted as a standard for all articles of food the physiologic or metabolic value of human milk This, representing 667 small calories, has been named by Pirquet "nem' (Nahrungs-Einheit-Menge or Nutritionis ElementuM) To this the metric system is applied giving the words dekanem as the nutritional value of 10 gm of milk, hektonem, 100 gm , kilonem 1 000 gm and tonnenem 1,000 kg Pirquet reasoned that milk is best adapted for a standard value of nutrition because it contains all the ingredients—protein, fat, carbohydrate, water and salt It is the only nourishment that the human body receives during the first year of life, and it is well adapted to support the life of the adult

He has divided all articles of food into eight groups Thus, sugar containing in 1 gm six times the value of 1 gm of milk is equal to 6 nems Suppose that a nursing infant needs 600 c c of human milk per day and must be fed artificially The nem value of human and cow s milk is about the same However, the child fares better on cow s milk when it is diluted—one-half milk and one-half water—thus reducing the nutritional value by one half We are therefore obliged to add to the milk enough nourishment to make up the nem value either by adding fat or sugar We add to the milk 100 gm of water which has no nutritional value, but since 1 gm of sugar is equal to 6 nems we add to the 100 c c of water 17 gm of sugar, this solution is equal in nem value to 100 c c of milk Hence, a child taking 300 c c. of milk and 300 c c of a 17 per cent solution of sugar per day receives the same nutritional value as if it were taking 600 c c of milk Suppose we wish to give the child a combination of other articles of food instead of sugar The nem values of such articles are 1 gm of food, 12 nems, 1 gm

value of cereal, 5 nems Our aim should be to prepare a dish which has the same value as milk One hundred and thirty grams of milk have the value of 130 nems, 8 gm of cereal at 5 nems equal 40 nems, and 5 gm of sugar at 6 nems equal 30 nems This mixture is cooked down to 100 gm The nem value of the porridge is 130 plus 70, or 200 nems, or twice as great as that of milk, that is, 1 gm of the porridge equals 2 nems Such a food Pirquet names doppelnahrung, or double nourishment

I do not care to take up the interesting discussion about the value of fat in the dietary and Pirquet's opinion that it can be safely eliminated by substituting an equal nem value of starch It would lead me too far Suffice it to say that from his investigations he concludes that there is not such a thing as minimum requirement of fat for the sustenance of the human body He looks on fat as a luxus," a condiment, that is not of vital necessit

Not so with proteins The minimum requirement is 10 per cent of the daily ration He derives this percentage in the following manner One hundred grams of human milk equal 100 nems or hektonems which contain 1 7 grams of protein, equal to 10 nems or 1 dekanem, in other words, human milk contains 10 per cent of nem values of protein Since milk with its 10 per cent of protein is able to develop the human body during the first year of life, it can do likewise for the adult For instance, 40 gm of lean meat contain 100 nems or hektonems, but its protein value is not that of 100 nems of milk, which equal only 10 nems, but is six times as much, 60 nems or dekanems Another example Forty grams of egg equal 100 nems (in round numbers) The protein nem value is three times that of milk or 30 nems Eighty grams of potato equal 100 nems Potatoes contain only one half the nem value of milk or 5 nems Pirquet is in accord with Chittenden's conclusions (Physiological Economy of Nutrition with Special Reference to the Minimal Protein Requirement of the Healthy Man, New York, 1904) though the amount of protein may be safely reduced He postulates that the daily rations should contain a minimum of 10 per cent up to a maximum of 20 per cent of proteins per day

Here we come to the second pillar of the superstructure on which Pirquet's system of nutrition rests Rubner calculates the amount of nourishment (in calories) according to the surface of the body Pfaundler has recently (Korpermass-studien, Springer Berlin 1916) pointed out the difficulties of the method and devised a method of his own The method in vogue is the formula of Vierordt-Meeh (Anatomische, physiologische und physikalische Daten und Tabellen fur Mediziner, Fischer, Jena, 1906), namely, O equals $mP^{2/3}$, wherein O is the surface of the body m is the stature and P the weight Hosslin and Pfaundler came to the conclusion that it is not at all the surface of the body that is the criterion for amount of nourishment, but it is the surface of the blood vessels I shall not enter into the intricacies of the mathematical calculations Pirquet has worked on these formulas and verified their findings clinically and arrived at the great discovery that the surface of the intestine can be substituted for that of the surface of the body He has further found that the surface of the intestine equals the square of the sitting length of the body (measuring from the crown of the head to the coccyx) The sitting length is named Si Pirquet looks on the intestine as the surface on which the whole of the food is spread out and finds that each square centimeter is fed by one nem It therefore follows that the amount of nems necessary for the nourishment of any individual can be found by squaring the sitting length of the body The square of the sitting length Pirquet named Siqua

For instance, the maximum daily nourishment for a nursing child whose sitting length (Si) is 40 cm is equal to 40 (Siqua) or 1,600 nems An adult whose sitting length is 90 cm should receive daily 90² (Siqua) or 8 100 nems or the nutritive value equal to 8 1 liters of milk

From the foregoing it is evident that the amount of nourishment for all persons is prescribed in accordance with the simple method of taking the sitting length measurement and multiplying it by itself which gives the number of nems per day It is noteworthy that when these daily nem values are compared with the caloric values they are found to be about identical Pirquet has divided the sitting length into seven groups

In conclusion I wish to say that my interpretation of the system might lead one to think that it is a very complicated affair, yet it is a fact that American nurses and social workers who visited the clinics of Pirquet or who worked in the kitchens of the A R A have all considered the method simple and practical and many returned to the United States as ardent propagandists of the Pirquet system of nutrition

C D SPIVAK M D, Vienna, Austria
American Joint Distribution Committee

NOTE—A more complete discussion of the Pirquet system may be found in a review by Faber H K. Von Pirquets Feeding System, *Am J Dis Child* **19** 478 (June) 1920—ED

Marriages

ELLIOTT STERLING ANDREW ROBINSON, New Haven Conn, to DR HORTENSIA AMANDA FARRALL of Oberlin, Ohio, at Bridgeport Conn recently

MARSHALL ABNER MOORE Ingram Branch, W Va to Miss Margaret Owens of Ceredo, W Va, at Huntington, W Va, in June

WALTER KELLOGG REED Boulder Colo to Miss Kate Chase of Denver, June 16

Deaths

William Winbourn Gray ⊕ Colonel, M C, U S Army (retired), Forest Hills L I, N Y, Bellevue Hospital Medical College, 1875, aged 69, who entered the army June 6, 1878, as assistant surgeon and was made colonel January 15, 1909, served as chief surgeon of the departments of the Dakotas and of the Missouri, and was retired December 6, 1912, by direction of the president, being over 62 years of age, died, July 3

Thomas Jefferson Buchanan, Tom's River N J, Jefferson Medical College 1889, aged 62, a member of the Medical Society of the state of Pennsylvania, a bacteriologist, a pioneer in the study of the effects of the roentgen ray on malignant growths, founder of the Tom's River (N J) Hospital, a member of the faculty of his alma mater, died, July 15, from malignant disease, the result of prolonged exposure to roentgen ray

Eugene C Powell, McKenney, Va, University of the City of New York, 1861, aged 80, an honorary member of the Medical Society of Virginia, hospital steward and acting assistant surgeon C S Army, during the Civil War, county superintendent of schools of Dinwiddie County for twenty-seven years, and for fourteen years president of the Bank of Dinwiddie, died, May 18

Almer O Huntley, North Bloomfield, Ohio Starling Medical College, Columbus, Ohio, 1886, aged 77, a veteran of the Civil War, during a portion of which he served as physician on a hospital train, and was a prisoner at Andersonville Ga, for twelve years secretary and treasurer of the North Bloomfield Banking Company, and for many years township clerk, died, June 22

Claude Raymond Woods, Delhi N Y, University of Bishop's College Montreal, 1891, aged 52, a member of the Medical Society of the State of New York coroner of Delaware County, formerly a medical missionary in India while driving in his automobile over a grade crossing at Unadilla, N Y, July 6 was struck by a train and instantly killed

W H Minton, Jr, Houston, Texas (license Texas State Board of Medical Examiners, 1907, and in Tarrant County, Texas, 1895), a member of the State Medical Association of Texas, assistant state health officer of Texas since February, 1909, and prior to that time connected with the state pure food department, died, July 6

James H Rogers, Beaudry, Ark (license State Medical Board of Arkansas 1903), aged 55, while attempting to search an automobile in which James Carmody was riding was shot and killed by Carmody July 9, who surrendered himself to the police stating that Rogers claimed to be a United States marshal

Ernest A Robin ⊕ New Orleans, La, Tulane University New Orleans 1891, aged 51, professor of diseases of the eye in the New Orleans Polyclinic, first assistant surgeon in the eye department of the Eye, Ear Nose and Throat Hospital, New Orleans, died, July 9, from heart disease

B Fortunatus Magruder, Fort Worth, Texas Washington University School of Medicine Baltimore, 1871, formerly local surgeon of the Gulf, Colorado and Santa Fe Railroad at San Angelo, Texas, once president of the San Angelo District Medical Society, died, June 5

John W Stewart, Rock Island Ill, University of Pennsylvania, Philadelphia 1867, aged 75, since 1869 a hardware merchant and real estate dealer of Rock Island, president of the Rock Island Humane Society, died in Estes Park, Colo, July 16, from pneumonia

William G Gamble, Guntown Miss, Medical College of Louisiana New Orleans, 1860, aged 86, surgeon in the Confederate Service during the Civil War, died at the home of his son in Greenville, Miss, July 11, from senile debility

William Cooper Eidenmuller, San Francisco, University of the City of New York, 1884, aged 63, formerly assistant city physician of San Francisco consulting physician to the French and Mt Zion hospitals, died, about July 10

Charles Lewis McCurdy ⊕ Bangor Maine, College of Physicians and Surgeons, Baltimore 1888, aged 66, at one time city physician of Bangor and for two terms a member of the board of aldermen, died, July 8

⊕ Indicates 'Fellow of the American Medical Association

Philip Asher, New Orleans, Tulane University, New Orleans 1897, aged 53, founder and dean of the New Orleans College of Pharmacy died in Touro Infirmary, New Orleans, July 5, from tumor of the bladder

Dallas L Scarborough ⊕ Grand Junction Iowa, College of Physicians and Surgeons, Keokuk Iowa, 1871, aged 76, who fell, fracturing his leg several weeks ago, died in a hospital in Iowa City, July 12

Hiram Beach Morse ⊕ Bay City, Mich, University of Michigan, Ann Arbor, 1890 aged 49, a specialist in diseases of the eye, ear, nose and throat, died, July 13, from cerebral hemorrhage

George Mortimer Snook, Parma, N Y, College of Physicians and Surgeons Baltimore, 1883, aged 79, a member of the Medical Society of the State of New York, died, April 16

James Francis Goodell ⊕ Rhinebeck, N Y, New York Homeopathic Medical College and Hospital, New York, 1879, aged 71, for several years health officer of Rhinebeck, died, May 20

Charles Wesley Brandenburg, New York, Eclectic Medical College of the City of New York 1891, aged 69, professor of physiology and hygiene in his alma mater, died, July 17

Smith J Posten, Morgantown, W Va, College of Physicians and Surgeons Baltimore 1881, aged 61, a member of the West Virginia State Medical Association, died, May 11

Eugene E McNicholl, Cobourg Ont, Queens University, Cobourg Ont, 1872 for several years medical superintendent of the Cobourg Hospital for the Insane, died recently

Alfred T Levick, Mt Vernon Ill, College of Physicians and Surgeons, Keokuk Iowa 1876, Missouri Medical College, St Louis, 1883, aged 74, died July 3

Lester Taylor Allen Mallette, Naylor Mo, University of Louisville Ky, 1910, aged 34, died at Cape Girardeau, Mo, July 9 from arsenic poisoning

Mathilde Annette Pelham, New York, New York Medical College and Hospital for Women, New York, 1900, aged 56, died July 16 from diabetes

Oscar S Parlow, Alvarado, Texas, Vanderbilt University, Nashville Tenn, 1883 aged 59, died recently in a sanatorium in Fort Worth, Texas

Robert Edward Lee Jessee ⊕ Philo Ill, Northwestern University Medical School, Chicago, 1896, aged 49, died, July 3 from heart disease

Thomas F Thompson, Snohomish Wash, State University of Iowa, College of Homeopathic Medicine, Iowa City, 1890, aged 71, died, June 20

Sam W Luten, Hickman Ky, Kentucky School of Medicine Louisville 1864 University of Louisville, Ky, 1868, aged 79, died June 25

George Arthur Boone, Troutville Va, University of Virginia, Charlottesville, 1873, aged 70, died in a hospital in Roanoke, Va, July 9

Ernest Kent Parker, Springfield, Mass (license years of practice Massachusetts), died in his office July 8, from cerebral hemorrhage

Martin Dutton Cook, West Stockholm, N J, University of Vermont, Burlington, 1875, aged 75, died, July 9, from heart disease

Albert G Girard, Clyde Kan, Western University, London Ont 1907, aged 49, died, April 18 from carcinoma of the glottis

Henry James Brown, Baltimore, Michigan College of Medicine Detroit, 1885, aged 89, a colored practitioner, died, July 19

Rudolph Joseph Schmeidel, San Francisco, California Eclectic Medical College, San Francisco, 1899, aged 48, died, July 9

George Edwin Townsend, Long Beach, Calif, College of Physicians and Surgeons, Keokuk Iowa, 1887 aged 62, died, July 6

William Sumner Long ⊕ Haddonfield, N J, University of Pennsylvania Philadelphia, 1878, aged 65, died, July 14

James Clemmons McAlister, Hamilton, Ont, Trinity Medical College, Toronto 1886, aged 59, died, April 30

Anton Komoracki, Alpena Mich (license, Michigan, 1900), aged 88, died, April 23 from typhoid fever

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

A LEGION POST ON NOSTRUM GHOULS

During the war THE JOURNAL exposed the methods of certain nostrum concerns that circularized the soldier body with 'scare literature" of their venereal cures Quackery as versatile as it is venal is now adding to its post-war gains by exploiting the families of the dead soldiery Taking advantage of the susceptibility of many a "gold star mother' whose mental and physical resistance has been weakened by grief the 'patent medicine maker has found it easy to 'work" her for a testimonial for this or that 'tonic This new phase of exploitation is dealt with in a resolution recently adopted by the Advertising Men s Post No 38 American Legion of Chicago Their attention had been called to the publication of advertisements of patent medicines' in newspapers and other periodicals purporting to be the testimony of grief-stricken survivors of men who gave their lives in the war We quote in part

BE IT RESOLVED that we go on record as condemning the use of war records of soldiers sailors and marines killed in this war for the exploitation of patent medicines that our Post send a copy of this resolution to the gold star mothers and other relations of departed heroes who through approbativeness cupidity ignorance or otherwise are allowing the publication of their photographs and testimonials together with the exploitation of the heroism of their heroic dead for the promotion of patent medicine sales and that our Post send a copy of this resolution to the Department of Illinois of the American Legion to the *American Legion Weekly* the Associated Advertising Clubs of the World the American Newspaper Publishers Association and divers other new papers magazines periodicals and associations interested.

BENZYL BENZOATE

Its Chemical Properties have been known for years

Its therapeutic properties as an antispasmodic have been known only a short time They are based on the investigations of D I Macht which showed the benzyl ($C_6H_5CH_2$) group to possess properties peculiar to papaverine

Before this new addition to Materia Medica can be given thorough clinical trials it is necessary that the products be of a quality sufficiently pure for medicinal use

FOR THE PHYSICIAN'S PROTECTION as well as an aid to the manufacturers

THE A M A CHEMICAL LABORATORY at the request of the Council on Pharmacy and Chemistry has elaborated purity standards It has also examined the market supply and found that on the whole the nonproprietary medicinal brands are of a satisfactory grade for clinical use

This is a greatly reduced reproduction of one of the numerous educational posters shown at the New Orleans session in the exhibit of the Chemical Laboratory of the American Medical Association

A SHOTGUN MIXTURE

A physician, whose name and address are omitted for reasons sufficiently obvious writes THE JOURNAL

My partner uses this with marked success on any and all intestinal cases of a medical type and I would be glad if you would give me your idea of why it is successful

Zinc sulphocarbolate	5
Bismuth subnitrate	15
Bismuth betanaphtholate	8
Camphorated tincture of opium	15
Syrup of acacia	30
Elixir lactopeptine sufficient to make	130

Mix and give one dram every two hour

In this prescription the chief active ingredients are bismuth subnitrate and camphorated tincture of opium The zinc sulphocarbolate is superfluous and its absence would not be missed so far as its effect is concerned Bismuth betanaphtholate probably differs in no wise in its action from bismuth subnitrate and might therefore likewise be omitted The Elixir Lactopeptine' is a vehicle the digestive activity of which is negligible and of no importance in this combination It therefore might as well be omitted and a vehicle like cinnamon water or simple elixir substituted Syrup of acacia of course serves for the purpose of suspension of the heavy powder It would be better however to prescribe the bismuth subnitrate in powder form and alone One has then the sedative action of the bismuth and the narcotic actions of the paregoric and alcohol in the Elixir Lactopeptine The statement of our correspondent that his mixture is used with marked success on any and all intestinal cases of a medical type is doubtless an exaggeration If it is not the physician who gives this mixture has been fortunate in having cases in which there was no danger of locking up irritating material in the intestines through the administration of an opiate The mixture itself is complex and unscientific to prescribe it indiscriminately in all intestinal cases of a medical type" would be sheer empiricism

Correspondence

REMOVAL OF SMALLPOX PITTING

To the Editor —In Queries and Minor Notes (THE JOURNAL June 19 1920 p 1752) is a letter asking whether there is a remedy for old lesions of the skin caused by smallpox You state that there is no way of removing the scars (pitting) of smallpox

With this broad statement I take issue In some cases the disfigurement can be eradicated It depends on the amount and depth of pitting the close approximation or the widespread distribution of the pits the color and texture of the skin and the area to be treated —whether the nose the cheeks the forehead, etc Nearly all cases can be improved and with the exercise of patience and care some cases can be cured I have successfully treated smallpox pitting the scarring of acne indurata and the pitted skin of hypertrophic rosacea with the following method

A solution of equal parts of trichloracetic acid and water (approximately a 50 per cent solution of the acid) is employed A small pledget of cotton is attached to a fine-pointed piece of orange wood stick The hollow pit of the crateriform scar is coated with a thin layer of liquid petrolatum or oil The edge of the crater is lightly touched with the acid solution forming a ring about its periphery the application being continued until the skin surrounding the pit for a distance of about one-sixteenth inch has turned white Beyond this whitened zone a much weaker application of the acid is made using a solution of say 10 per cent strength so that the intensity of the action of the acid solution gradually lessens as it recedes from the periphery of the pit Or the 50 per cent solution may be employed beyond the whitened zone the action of the acid being controlled by applications of alcohol or water (neutralization) The appearance of such a lesion following this treatment may be aptly compared to the rays of the sun intense light rays

at the periphery, gradually shading off centrifugally The application of the acid has to be made so that there is no sharp line of demarcation surrounding the pit—the acid must be made to "shade off" into the surrounding skin When the smallpox pits are closely set together, the entire area may be treated, piece by piece, with the method outlined In the treatment of the disfiguring pitting of hypertrophic rosacea and nonlobulated rhynophyma, this procedure has been invariably successful in my hands From six months to a year's time is required to produce good results in the average case The application of the acid results in the formation of thin, brown, adherent scabs which are allowed to drop off spontaneously—which usually occurs in from ten days to a fortnight A week or two should elapse before the second application is made over the same area, after the scabs have dropped off

In cases of smallpox pitting, paradoxical as it may seem, the more numerous and closely set the scars are, the better the final result This is because large areas of the affected skin may be "planed off" with impunity, in isolated shallow pits, the results are not so easily attained, as the contrast from bad to good is so much less evident, after the completion of the treatment All cases must be carefully selected, and one or two pitted spots may be experimented on, without making matters worse

I claim no originality for this treatment

FRED WISE, M D, New York

PROHIBITION AND THE MEDICAL PROFESSION

To the Editor —I am not at all in sympathy with your "Prohibition" article under date of July 17 1920 The best surgeons in Milwaukee daily prescribe alcohol either in the form of a nutrient enema egg-nog or stimulant Interviews have been printed in our daily papers in which high-standing physicians are quoted scathingly condemning the government for curbing the privilege of prescribing whisky No layman and no government has the right to tell the physician what to prescribe and what not to prescribe You may just as well limit the busy industrial surgeon in the number of bandages or yards of gauze he is allowed to use, as to limit him in the number of ounces of whisky he may prescribe To shear all physicians over the same comb in their limitation of prescription blanks is equally asinine and autocratic Some physicians see one case a day, others treat a hundred patients a day, while some physicians use quinin morphin, etc, others have greater faith in alcohol It is not for you or me to say what is the best remedy, nor when whisky is indicated, because we do not know During the late influenza epidemic the mortality in our hospitals was frightfully high, while the mortality in localities where modern scientific medicine was unknown was much lower Until we, as scientists, explain this to the people, they will believe in whisky as a good home remedy

As for the sacredness of the eighteenth amendment, permit me to tell you that many of our best physicians believe that this amendment was a fraud on the people It is an axiom in law that where fraud appears it carries its own nullification with it The common people were not consulted when this amendment was passed, in fact, the fanatics saw to it that our best people were in France and Russia at the time

I cannot agree with you that it is within the discretion of the government to dictate to me what to prescribe and when to prescribe it I am still old-fashioned enough to believe with Dr Porter in the sanctity of the physician's prescription, and that every self-respecting physician should resent all lay interference, be such interference fanatical, political, federal or police power In fact I attribute much of the restlessness and lawlessness of the times to the fanatic obsession of the administration, which imagines that its own tastes and prejudices are advance messages, specially sent out by an all-wise Providence to guide the wheels of the universe

I do not use much alcohol in my practice, but I have every regard for the courageous physician who substitutes whisky for opium, and then still more whisky for the many idiotic drugs THE JOURNAL favors Whisky may do some harm here and there, but the moral good it advances in combating the sinister will of the fanatic in his program of oppression and repression will more than offset this possible physical evil Let every clean self-respecting, modern and progressive physician give whisky the benefit of every doubt, and thus register his protest against all autocracy, usurpation and fanaticism Unless we do this, tobacco, coffee, canned fruit and even oxygen will be prohibited by future amendments or statutory laws RALPH EMERGREEN M D, Milwaukee

To the Editor —Relative to the editorial comments (THE JOURNAL July 24, 1920, pp 249, 250) on "The Newer Quackery," and 'The Easiest Way' I would beg leave to ask, is the latter any worse or even "less ethical" to further a hobby fad or whatever you may call it, than the former? Is not the latter a subterfuged ad of the prohibitionist?

LOUIS T KLINKER M D, New York.

[COMMENT —The question is not whether alcohol and spirituous liquors are needed in medical practice, not whether prohibition is right or wrong The question is whether the medical profession shall respect the law or betray its trust by becoming the accomplice of those who are willing to violate the law in order to satisfy their craving for alcoholic beverages The law gives the physician the right to prescribe alcohol or any of its preparations whenever in his judgment it is necessary in the treatment of the sick Every physician in his own conscience, knows how few the occasions are when a prescription for alcohol actually is necessary —ED]

"ELEVATION OF CONJUNCTIVA NEAR LIMBUS PREVIOUS TO CATARACT EXTRACTION"

To the Editor —In THE JOURNAL, July 17, 1920, p 177, Dr Whitmire suggests injecting water under the conjunctiva to facilitate a conjunctival flap May I improve his suggestion by advising the use of cocain instead of sterile water It answers a twofold purpose It produces the bleb, and it adds to the anesthetic effect

THE TEACHING OF VITAL STATISTICS TO MEDICAL STUDENTS IN BRAZIL

S T DARLING, M D, AND WILSON G SMILLIE M D,
SAO PAULO BRAZIL
Professor and Assistant Professor of Hygiene Respectively Faculdade de Medicina e Cirurgia

We have been so much encouraged by the happy result of our attempt in Brazil to interest our students in the subject of vital statistics, particularly in regard to the assignment and certification of causes of death that we wish to report briefly our methods

It was the duty of one of us (S T D) for several years, at Ancon Hospital, to make the causes of death turned in by the physicians there fit the classification of the "International List of Causes of Death" It was customary there to pay more than usual, even extraordinary, attention to the difficult subject of assigning correctly the cause of death in the cases that came to necropsy The combined services of the pathologist, bacteriologist, and at times the chemist were used to effect this As early as 1908 before the publication by Dr Cabot of his comparison of clinical diagnoses and postmortem findings, Col John L Phillips, superintendent of Ancon Hospital had ordered that the laboratory should be required to investigate all cases of fever not definitely pneumonia or tuberculosis and not reducible by quinin within three days, and he later ordered that when the anatomic diagnosis differed markedly from the clinical diagnosis, they should be reported in parallel columns to him for reference to the physician in charge of the case These wise hospital regulations led to beneficent results, as can well be imagined—results of value to the patients, the physicians, the pathologist, and the sanitary officer In the task of making the causes of death conform to the international classification it was realized how thoughtlessly the work of assigning a cause of death is usually done by the generality of busy practitioners, and even by the best of qualified men when their attention is not specially directed to the requirements of the health officer and the statistician A comparison of the diagnostic results obtained at Ancon Hospital and the procedure and care exercised there to arrive at an accurate cause of death, with those seen in other parts of the tropics confirmed us in the desire to emphasize to our students the importance of correctly diagnosing and assigning a cause of death in such a way that the sanitary officer and the statistician may be put in possession of the information so requisite to them Probably no subject is treated so carelessly by physicians as that of assigning a cause of death We are convinced that one reason for this is that there has been no special class-work devoted to the subject in the medical schools We determined to remedy this defect, so far as the Faculdade de Medicina e Cirurgia at São Paulo was concerned

Lectures were given in which the subject was fully explained The publications of the United States Department of the Census that is, the 'International List of the Causes of Death' in its expanded form, the 'Joint Causes of Death," and the little "Physicians Handbook were shown the class and their contents explained to them

Field excursions to the department of demography were made Through the courtesy of Dr Arthur Neiva director of public health for the state of São Paulo and Dr Meyer, chief of the department of demography an afternoon was spent in showing the students every detail in the subject of collecting and compiling the data returned to the demographer The errors of the physician, both of commission and omission were shown and fully explained The students were enabled to see the results which would accrue from their thoughtlessness or carelessness Their attention was directed to the necessity of referring certain causes as, for example, embolism under accidents of childbirth' when the disease had occurred with childbirth, or of referring a death to homicide when in fact it had resulted in that way The students were counseled to avoid indefinite or ill-defined terms such as 'stroke' 'atrophy" or "convulsions" Typical and common faults were shown by the demographer and his clerical assistants and the students were told how to avoid them Not only was the exercise well attended but it was followed with marked attention and unflagging interest

Finally practical class exercises were given in the laboratory, in which typical problems were presented to the students for working out—problems in which the students were required to assign a cause of death which would give the health officer and the statistician the information required by them for the proper and intelligent conduct of their work

The interest that was aroused by these practical laboratory exercises was extraordinary and entirely unexpected Part of this interest undoubtedly is due to the fact that the Latin temperament likes a problem presented in such a way that there is a chance for ratiocination and polemics and partly because we stimulated their sense of civic and national pride Be that as it may the results make us feel that the experiment can be tried with success not only in other parts of South America but also by schools in the United States and elsewhere

PRACTICAL EXERCISES

Besides the lecture on vital statistics and the visit to the state department of demography already described the students have two practical exercises of two hours each, corresponding to laboratory periods The work falls naturally into two divisions

1 The proper method of compiling vital statistics
2 The proper methods of interpretation of vital statistics

The proper compiling of vital statistics depends in no small part on the physician for he is the origin of almost all data and their accuracy is absolutely dependent on his intelligence knowledge and painstaking care In order that there may be a uniform terminology, the International List of Causes of Death has been compiled and is now available in English French, Spanish, German, Portuguese, Chinese Japanese and many other languages The adoption of the international list was a great forward step in securing uniformity of vital statistics, but since deaths may be reported for one cause only, with one other disease as a secondary or contributory cause and since individuals die in the majority of instances from a complication of diseases, the selection of the proper cause of death from among three or four or a possible half dozen causes must be made with care

These facts are explained to the students who are then given the six rules of Bertillon by which the physician may determine the primary and contributory causes of death

SIX RULES OF BERTILLON FOR PROPER CLASSIFICATION OF CAUSES OF DEATH

1 If one of the two diseases is an *immediate and frequent* complication of the other the death should be classified under the head of the primary disease.

2 If the preceding rule is not applicable, the following should be used If one of the diseases is *surely* fatal and the other is of less gravity, the former should be selected as the cause of death

3 If neither of the foregoing rules is applicable, then the following If one of the diseases is *epidemic* and the other is not choose the epidemic disease

4 If none of the preceding rules is applicable, the following may be used If one of the diseases is *much more frequently fatal* than the other, then it should be selected as the cause of death

5 If none of the four preceding rules applies, then the following If one of the diseases is of *rapid development* and the other is of slow development, the disease of rapid development should be taken

6 If none of the foregoing five rules applies, then the diagnosis should be selected that best characterizes the case

It is to be noted that in Rule 3 the term epidemic disease is used This is a rather indefinite term, and therefore in order to have a criterion we choose diseases as epidemic if they are on the list of reportable diseases of the state in which a physician lives The list of reportable diseases for his state are then given the student and he is required to memorize both the rules of Bertillon and the list of reportable diseases

Having established a basis on which to work each student is given a blank death certificate and a problem with the request that he fill out the certificate properly in fullest details Some examples of these problems may be given

Problem—You have been treating a boy aged 15 years for the last three weeks who has typhoid fever Three days ago he suddenly developed bronchopneumonia and died Make out a proper death certificate

The tendency of the student is to put bronchopneumonia as the cause of death, and typhoid fever as a contributory cause By careful reading of Bertillon s rules, however he sees that though Rules 1 and 2 do not apply in this case Rule 3 has a very direct application and the disease should be reported primarily as typhoid fever because this disease is reportable and has great hygienic importance

Problem—You have been attending a girl aged 4 years for three months The child had scarlet fever six months ago and developed nephritis which has progressed steadily and the child died

In this instance the acute symptoms of scarlet fever such as fever, rash, etc, had long since passed away, and therefore the tendency of the student is to classify the death as nephritis for the primary cause and scarlet fever for the contributory cause This, of course, is incorrect, since according to Rule 1, in case a disease is a direct and frequent complication, as nephritis following scarlet fever the nephritis should be classed not as the primary but as the contributory disease

Problem—An old syphilitic alcoholic aged 56 was picked up in the street by the ambulance and died before he reached the Santa Casa Necropsy revealed cirrhosis of the liver anasarca and cardiac insufficiency—syphilitic aortitis and endocarditis Make out death certificate

This problem is a difficult one and not an uncommon picture on the necropsy table Furthermore none of the rules of Bertillon apply, except possibly the last one The general conclusion among the students in the discussion of this case is that the death should be classified as follows primary cause, syphilitic aortitis, contributory cause, cirrhosis of liver

In solving the problems the rules published by the Society of Medical Officers of Health of England, and the introductory remarks in the Bureau of the Census Manual of the International List of the Causes of Death are also used

These problems are typical examples of the difficulties which each student must solve in filling out the death certificate When all are finished, each student reads his problem and his solution, while the others criticize his conclusions

This exercise has proved valuable in that it has opened the eyes of the students to the importance of recording an accurate diagnosis on the death certificate the necessity of some standard method of reporting causes of death, and the important part played by the physician in the compilation of mortality statistics

INTERPRETATION OF VITAL STATISTICS

The second practical exercise is devoted to the proper methods of interpreting vital statistics This exercise is of course very simple, and deals only with the method of calculation of the more important rates pointing out the common errors in calculation and interpretation of rates, mistakes in the making of charts etc Each student in the class is given a problem in vital statistics, and required to make a chart All necessary data are furnished, he being required only to calculate the rates and make the chart

Problems are given for example, to illustrate the methods of determining birth rates—e g so many births per thousand calculated population One student makes a chart of his own city for the last twenty years another a chart of his own city in comparison with twenty other large cities throughout the world for a given year A third makes a chart of the death rate of São Paulo and twelve other cities of Brazil with a population of more than 50 000 people, there are only twelve such cities in all Brazil from which statistics are available Similarly death rates are calculated for São

TABLE 1—INFANT MORTALITY IN SÃO PAULO COMPARED WITH THAT OF OTHER CITIES

Cities	Data Furnished to the Student: Deaths from 0 to 1 Year	Births	Rate Calculated by the Student
São Paulo	2 619	17 596	147
Buenos Aires	4 123	43 961	94
Boston	2 05.	19 760	103
Montevideo	1 041	9 383	108
New York	12 818	137 664	9.
London	8 819	99,341	88
Lisbon	1 795	8 802	203
Stockholm	528	6 583	80
Havana	1 156	5 389	212
Bologna	448	3 3.0	134
Milan	1 209	9 788	121
Marseilles	1 0.8	6 623	1.6
Paris	2 853	28 271	100

Paulo for a period of years and for a given year in comparison with cities of the world and cities of Brazil Thus the student learns not only what a normal rate should be, but also how his own city and nation stand in relation to the outside world

The various methods of calculating infantile mortality are explained and the advantage of using the standard method of calculation e g the number of deaths under 1 year exclusive of stillbirths per thousand births is dwelt on The various common causes of a high infantile mortality are mentioned

One student then calculates the infantile mortality rate of São Paulo in comparison with previous years another the rate for Sao Paulo in comparison with foreign cities, and a third the rate for São Paulo in comparison with twelve other Brazilian cities This comparison makes a great impression, since Sao Paulo has a very high infant mortality rate, because it is an industrial city many mothers working in the factories and because it has a very bad milk supply

Other problems include specific disease death rates, calculated by the number of deaths per hundred thousand population Comparisons are made of the capital city with the rates for previous years, and also with other foreign and national cities in respect to specific death rates for typhoid fever malaria, diphtheria, scarlet fever measles, dysentery, smallpox cancer and other diseases A typical problem may be cited (Table 1)

When all calculations are completed, each student presents his problem and his conclusions to the class for criticism

The most interesting feature of this exercise is the effect on the students of the comparison of the vital statistics rates of São Paulo with those of other cities in Brazil and of other nations The students have great civic pride, and they are proud of their native state, so that one can observe the rapid and pronounced fluctuations of the emotional barometer of the whole class as each problem is read A tremendous enthusiasm develops when the chart on comparative birth rates is shown, for São Paulo has one of the highest birth rates of any large city in the world of which reliable statistics are available There is an abrupt fall in enthusiasm when the comparative death rates are calculated, and deep gloom settles down when the high infantile death rate is compared with those of the large cities of other nations There is quiet satisfaction when the specific death rates for dysentery at São Paulo are compared with these of Bahia and other cities in the north of Brazil followed by enthusiasm over the low death rates for scarlet fever, whooping cough and diphtheria as compared with cities of the United States and of Europe

TABLE 2.—BIRTH RATE OF SÃO PAULO COMPARED WITH THAT OF OTHER CITIES 1916-1917

Cities	Data Presented to Student: Population	Data Presented to Student: Births	Rate Calculated by Student
Sao Paulo	470 873	17 598	39 4
Buenos Aires	1 610 594	43 961	29 1
Boston	767 539	19 760	25 0
Montevideo	373 581	9 383	20 8
New York	5 602 841	137 664	24 6
London	4 237 387	80 544	19 8
Lisbon	471 424	8 802	18 07
Stockholm	408 792	6 774	16 05
Havana	363 297	5 389	14 07
Bologna	201 905	3 390	16 04
Milan	705 049	9 788	13 07
Marseilles	583 740	6 623	11 03
Paris	2 847 229	28 298	9 8

These two practical exercises, brief as they are, transform the notion of vital statistics in the mind of the student Instead of its remaining as long columns of incomprehensible figures, it becomes vitalized parts of his own life, a function of the state for which he will be responsible, an accurate index of the civilization the progress and the development of the medical science and public health in his own city and nation He is awakened from a self-satisfied lethargy and sees his nation as others see it He would resent any criticism of his city as a personal insult, but readily accepts the severe criticism of the statistical chart for he realizes that figures are impersonal factors which are applied in standard ways throughout all parts of the world

Washington January Examination

Dr William M O Shea, secretary, Washington Board of Medical Examiners, reports the written examination, held at Spokane, Jan 6 8, 1920 The examination covered 13 subjects and included 130 questions An average of 75 per cent was required to pass Of the 12 candidates examined, 11 passed and 1 failed Forty-nine candidates were licensed by reciprocity The following colleges were represented

College	Year Grad	Per Cent

Book Notices

ORTHOPEDIC SURGERY FOR THE STUDENT AND PRACTITIONER By Dr Georges Laurens Authorized English translation of the Second Revised French Edition by H Clayton Fox F R C S With a Foreword Contributed by J Dundas Grant M A M D F R C S Cloth Price $4 50 Pp 339 with 592 illustrations New York William Wood and Company 1919

If the American reader will discount those sections dealing in technic—wherein the methods in vogue in this country are obviously superior to those of the continent—he will be gratified to have found a real textbook for beginners and general practitioners It must be remembered that the book is written only for the student and the practitioner, and stops at the point of operative interference when the specialist must be called in A fund of valuable and practical information is contained in its pages of a character rarely found within the covers of a single publication Moreover, the author does not skim through the subjects discussed in the usual textbook manner He has put personality into the work, with the result that one feels one is reading an earnest lecture rather than a stereotyped textbook Of particular value is the minuteness of detail with which Laurens instructs in the art of examination and the same love of detail persists in his care of the patient Under each necessary head come two valuable paragraphs 'What to do' and 'What to avoid' which are of especial usefulness to the beginner and the physician in general practice The book is a marvel of completeness in its field and should be welcomed by those practitioners who through choice or necessity, take care of 'special cases' in practice

A GENERAL INTRODUCTION TO PSYCHO-ANALYSIS By *Prof Sigmund* Freud LL D Authorized translation with a Preface by G Stanley Hall President Clark University Cloth Price $4 0 Pp 406 New York Boni & Liveright 1920

This book presents a translation of twenty eight lectures delivered to laymen by the author He tries to make a difficult subject elementary and succeeds in spots, but unless the laymen to whom the lectures were delivered had considerable fundamental knowledge of psychology and of the nervous system it is doubtful whether the lectures accomplished all that the author wished them to accomplish They are divided into three groups the first four lectures concerning the psychology of errors, the second ten lectures on dreams and the last fourteen lectures on the general theory of the neuroses For those who have sufficient fundamental knowledge and who wish to begin at the bottom in their study of the Freudian movement and psychanalysis this is an excellent one since it bears the authority of the originator of this school of

thought For those who have not the requisite fundamental knowledge, there are several books which are probably simpler and have the additional advantage of being brief

DIE RFIZTHTORIF UND DIE MODERNFN BEHANDLUNGSMFTHODEN DFS DIABFTES Von Priv Doz Dr R Kolisch Paper Price, 30 marks Pp 152 Vienna Urban & Schwarzenberg 1918

Kolisch for so long a time has been an enthusiastic advocate of undernourishment in the therapy of diabetes that this little book, setting forth in concentrated form his theories and method of treatment is particularly appropriate He is a great believer in the theory that the cause of diabetes resides in an overproduction of sugar, "in an increased cleavage of sugar out of the tissues from highly complex molecules" This breaking off of sugar from the highly complex molecules is caused by irritation Despite the tremendous experimental work of the last thirty years an etiologic therapy of diabetes is still lacking, and modern treatment rests on diet The kernel of Kolisch's whole discussion is obtained from the following paragraph, which we believe should be quoted in full

This normal and continuous splitting off of sugar from the protoplasm from the tissues apparently is increased in diabetes probably the result of toxins or nerve irritations and this increased splitting off of sugar from the tissues explains the hyperglycemia and the glycosuria in the sense of being an overproduction of sugar inasmuch as this splitting off is much in excess of actual needs (Dieser normale und kontinuierliche Vorgang der Abspaltung von Zucker aus dem Protoplasma aus den Geweben ist beim im Diabetes gesteigert wahrscheinlich durch toxische Influsse oder nervose Reize und diese vermehrte Abspaltung von Zucker aus den Geweben erklärt die Hyperglykämie und Glykosurie im Sinne einer Ueberproduktion von Zucker, da die Abspaltung den jeweiligen Bedarf bedeutend übertrifft)

American readers are now so well acquainted with undernourishment in the treatment of the disease that not much need be said concerning this section of Kolisch's discussion which throughout seems to be characterized by an appreciation of the necessity of maintaining the individual patient at an existence level He differentiates this from starvation, and in his closing paragraph criticizes Allen's earlier publications on absolute starvation

Some figures quoted from the mortality statistics of Vienna are used by Kolisch as evidence of the value of undernourishment in the prevention of death from diabetes These statistics are given in the accompanying table This monograph is indeed, an interesting and valuable contribution

DEATHS FROM DIABETES IN VIENNA AND TOTAL MORTALITY

	Total Mortality		Cause of Death Diabetes	
Year	Civilian	Military	Civilian	Military
1913	32 130	184	337	2
1914	31 480	1 788	292	2
1915	33 052	3 966	265	6
1916	33 494	4 137	265	15
1917	40 260	5 871	194	15

STANDARD METHODS FOR THE EXAMINATION OF WATER AND SEWAGE Fourth edition Cloth Price $1 25 Pp 115 Revised by Committees of the American Public Health Association American Chemical Society and Referees of the Association of Official Agricultural Chemists Boston American Public Health Association 1920

This edition contains few important changes No changes whatever have been made in the chemical procedures In the preparation of culture mediums, American peptones have been made standard and the concentration of carbohydrates in broths has been reduced from 1 to 0 5 per cent The most important addition to the methods is the introduction of phenol red for adjusting the reaction of mediums This should rapidly replace titration with phenolphthalein

ARTERIOSCLEROSIS AND HYPERTENSION WITH CHAPTERS ON BLOOD PRESSURE By Louis Marshall Warfield Third edition Price $4 St Louis C V Mosby Company 1920

In this edition Warfield has added new material and revised the old, thus bringing the book well up to date The subject is treated in a somewhat elementary fashion, but the main features are given sufficient attention The views expressed are in general those with which most investigators and clinicians would agree The printing, type paper and illustrations are excellent The book can be commended as a safe guide for the student or practitioner desiring an introduction to this subject

Failure to Diagnose Pregnancy—Omniscience Not Required

(Jaeger Stratton (Wis) 176 N W R 61)

The Supreme Court of Wisconsin, in affirming a judgment in favor of the defendant, who was sued by Mr and Mrs Jaeger in separate actions for damages for alleged malpractice after which the actions were consolidated and tried as one, says that Mrs Jaeger at the time she was examined by the defendant had borne nine children Her menses had ceased two months before that, and she feared that she might be pregnant She suffered from headache, gas in the stomach, and severe bearing down pains in the lower abdomen She had not had such pains in her former pregnancies, and so became alarmed and consulted a physician, who did not definitely diagnose her condition, but suggested pregnancy, a tumor or inflammation of the appendix, and advised her to come back in a couple of months Instead of doing so she went to the defendant who found a serious inflammatory condition with pain and tenderness in the lower abdomen The uterus was somewhat enlarged, and there appeared to be an inflammatory mass in the broad ligament The defendant diagnosed the latter as the chief cause of the trouble, though he thought it might be appendicitis or, possibly pregnancy He advised an operation She said she did not want to be operated on if she was pregnant He told her he thought she was not She consented to an operation and told him to remove the appendix when he took out the tumor The operation disclosed that she was about two and a one-half months pregnant and that she had an inflamed appendix covered with a Jackson's membrane The appendix was removed and she made a normal recovery, and in time gave birth to a living and healthy child The medical testimony showed without dispute that the failure to diagnose accurately her condition was due neither to lack of care, skill nor judgment, that under the conditions as they appeared an early operation was advisable, that the operation was skilfully performed, that the patient made a normal recovery, and was relieved from a menace that might have resulted very seriously during later pregnancy by having to have the inflamed appendix removed In view of such testimony the trial court properly directed a verdict for the defendant When a physician exercises that degree of care, diligence, judgment and skill which physicians in good standing of the same school of medicine usually exercise in the same or similar localities under like or similar circumstances, having due regard to the advanced state of medical or surgical science at the time, he has discharged his legal duty to his patient Where due care diligence judgment and skill are exercised a mere failure to diagnose correctly does not render a physician liable Not omniscience, but due care, diligence judgment and skill are required of physicians When they meet such test, they are not liable for results or errors in judgment

Violation of Medical Practice Act by Spiritualist—Sufficient Information

(People v Krause (Ill), 125 N E R 726)

The Supreme Court of Illinois, in affirming a judgment of conviction of the defendant of a violation of the medical practice act, says that the record showed that two women inspectors employed by the city of Chicago called at the defendant's place of business and found him treating an old man that the defendant's wife gave Miss Morley a reading telling her, among other things that she was suffering from lung trouble, that Miss Morley told her that she did not think she had that trouble but if the reader had told her that she had stomach trouble she might have believed her, that the defendant's wife then said it made no difference what her trouble was, her husband would give her a treatment which would cure her, that the inspectors then went out into the room where the defendant was and found him treating a woman, that the defendant invited Miss Morley to sit down

on a chair and remove her coat and hat, that the defendant placed her feet and put her hands on her knees, that he then manipulated her shoulders and her back, that he put his hand on her forehead and put his head to her back and listened, that he continued this treatment for fifteen minutes and then inquired if she did not feel better, that he charged her 50 cents for the treatment that she was suffering from no ailment when she was treated by the defendant, that the defendant had in his window a sign calling himself a spiritualist, but that he said nothing to her about spirits The defendant contended that he healed through the influence of the spirits, that he laid his hands on the patient and asked the Deity to make the sick person well and that he gave such a treatment to Miss Morley, and that therefore he came within the exception to the statute and was not required to have a license But the contentions of the defendant could not be sustained Nor would it justify a reversal of the case even if it be conceded that certain instructions to the jury which were refused might properly have been given because the defendant was clearly guilty of the act charged, and no other verdict could be reached under the evidence in the record

Section 2 of the medical practice act provides that no person shall practice any system or method of treating human ailments without the use of drugs or medicines and without operative surgery, without a license so to do Section 20 of the act provides that any person shall be regarded as practicing medicine or treating human ailments who shall treat or profess to treat operate on or prescribe for any physical ailment or any physical injury to or deformity of another, excepting the treatment of the sick or suffering by mental or spiritual means without the use of any drug or material remedy

The information in this case charged that the defendant, not being then licensed to treat human ailments without the use of drugs or medicines and without operative surgery, did at the place and on the date named treat human ailments without the use of drugs or medicines and without operative surgery, that at the place and on the date aforesaid he did treat one Miss Morley by rubbing and by laying on of the hands and otherwise manipulating on the person of said Miss Morley, contrary to the form of the statute The information charged the offense substantially in the language of the statute, and was therefore sufficient The offense was stated plainly enough to be readily understood by the jury, and it informed the defendant of the offense with which he was charged so that he could properly prepare his defense This is all the law requires It was not necessary for the information to negative the exceptions

Hospitals Liable for Negligence of Employees

(Mullmer v Evangelischer Diakonniessen erein (Minn) 175 N W R 699)

The Supreme Court of Minnesota in affirming a judgment for $6 500 damages for the death of a pneumonia patient at the defendant's hospital, says that when the nurse in charge left the room, leaving the window slightly open, and five minutes later the window was found wide open and the patient was found lying dead on the ground below the jury might well find that he was killed by the fall In fact they could not well find otherwise. And when the nurse in charge testified that she felt that the patient needed watching, that he was in a dangerous condition in which he might commit injury to himself, that if she had had more help she would have thought it proper to watch him more closely, and that the only reason she did not watch him more closely was that she had so much work that she could not do so that evidence was sufficient to sustain a finding that the defendant was negligent in failing to provide a sufficient number of attendants and that the attendants were negligent in failing to exercise proper care for the patient s safety If this were a hospital maintained for the profit of the owners, liability for such negligence would be undoubted When a patient enters such a hospital knowing that the number of nurses is less than the number of patients he may not expect constant attendance, but the patient is entitled to such reasonable attention as his safety may require If the patient is temporarily bereft of reason and is known by the hospital authorities to be in danger of self-destruction the authorities are in duty bound to use reasonable care to prevent such an act

A more serious question is whether a hospital corporation constituted as was the defendant is liable to a patient for damages resulting from the negligence proved The defendant corporation was organized for the maintenance of a private hospital The ground on which the hospital building stood was donated The building was erected partly by money donated and partly by money borrowed The corporation had no capital stock and paid no dividends Its funds were used for the maintenance of the hospital It was not a free hospital It had a regular schedule of rates which patients were expected to pay The remaining small percentage were free or partly free The receipts from the pay patients exceeded the cost of maintenance including repairs by more than $5 000 a year This patient was a pay patient The defendant came within the class commonly known as charitable corporations The fact that its patients paid for their accommodations did not make it otherwise The distinguishing facts were that it was partly endowed by donation and that it was not conducted for purposes of gain There are numerous carefully considered decisions holding that such a corporation is not responsible for the negligence of its employees But in this court's opinion the rule of liability seems best and the court adopts it

One reason given for the rule of nonliability to patients is that when a person enters a charitable hospital he enters into a relation which exempts the association from liability for negligence of its servants in ministering to him, or in other words he assumes the risk of injury from such negligence As a matter of fact the patient who enters a hospital has no thought of anything of that kind His thought is that the hospital affords better facilities for caring for him than he has elsewhere at his command, and this court sees no reason why the assumption of such a risk should be imposed on him The same principle would exempt the hospital physician yet such exemption is not generally sustained Men are not exempt from the consequences of negligence though on a mission of mercy

Nor does this court think that the hospital corporation should be exempted from liability for the negligence of its employees so that the funds entrusted to it should not be diverted from the purposes for which they were given or because it derives no gain from the service rendered The corporation must administer its functions through agents as any other corporation does It harms and benefits third parties exactly as they are harmed or benefited by others To the person injured the loss is the same as though the injury had been sustained in a private hospital for gain The court does not believe that a policy of irresponsibility best subserves the beneficent purposes for which the hospital is maintained The court does not approve the public policy which would require the widow and children of the deceased patient, rather than the corporation to suffer the loss incurred through the fault of the corporation s employees or in other words, which would compel the persons damaged to contribute the amount of their loss to the purposes of even the most worthy corporation

Character of Sympathetic Innervation to Retractor Penis Muscle of Dog C W Edmunds Ann Arbor Mich—p 395
*Energy Expenditure in Household Tasks C F Langworthy and H G Barott Washington D C—p 400

Forced Respiration and Tetany—Forced respiration causes symptoms of tetany to occur in the human subject, these include carpopedal spasm, Chvostek's sign, Trousseau's sign, Erb's sign, and in one instance observed by Grant and Goldman a tetanic convulsion As a result of the fall of alveolar carbon dioxid tension produced by overventilation, there is a reduction in the hydrogen ion concentration of the blood, a reduction of the carbon dioxid capacity of plasma, a change in the reaction of the urine to the alkaline side, a decreased excretion of ammonia, and a slight increase in the calcium content of the serum The authors believe that the underlying factor in the tetany of forced respiration is the alkalosis

Carbohydrate Tolerance—Jacobson found that Eck fistula animals have an extremely low tolerance for laevulose The conversion of laevulose into glycogen is a function which is permanently lost when the portal blood is diverted into the vena cava by Eck fistula Glucose tolerance is only slightly modified in Eck fistula animals The liver is not entirely essential for glucose metabolism The muscles undoubtedly perform well the functions of glycogenesis and glycogenolysis when the liver is shunted out of the portal circulation The glycogenic capacity of muscle is increased following posterior lobe removal in an Eck fistula animal as in an intact animal The augmentation of tolerance is, however, considerably slower No augmentation of levulose tolerance is noted

Gastric Response to Pies, etc—A study was made by Miller and others of the acid responses and evacuation times of nearly fifty pies, cakes and puddings in the normal human stomach The average evacuation time on puddings for all subjects was two hours and eighteen minutes as against two hours and twenty-seven minutes for pies and three hours and two minutes for cakes Averaging the highest total acidities, values were obtained for puddings of 92 for pies of 90 and for cakes of 90 Direct comparisons of the three types of foods indicated also that pies were handled more readily than cakes, and pudding somewhat more readily than either

Artificial Production of Monsters—Baldwin reports the anomalies produced by a maximum effect of roentgen-ray energy on a relatively small amount of the protoplasmic mass of the frog's egg

Permeability of Placenta to Epinephrin—The experiments reported on by Shimidzu show that epinephrin in the fetal blood cannot be increased by a subcutaneous injection of the drug into the mother animal

Energy Expenditure in Household Tasks—Fifty-three experiments made by Langworthy and Barott on energy during the performance of various household tasks were made, using a specially designed respiration calorimeter and a young woman subject The results for such light tasks as sewing, crocheting, knitting, darning and embroidering, gave an average expenditure of 9 calories per hour more than that of the same subject sitting quietly in a chair, other tasks regarded as "harder work" than sewing, such as washing, sweeping and scrubbing floors, caused an increased energy expenditure over the expenditure when at rest with the same subject, of about 50 calories per hour Several other tasks studied gave results between these two figures thus, ironing dressing a child (life-size model) and dishwashing each requiring about 24 calories per hour During the experiment with dishwashing the height of the table used was varied, and a corresponding variation in energy expenditure was noted, a variation of 15 per cent in height of table causing an increase in energy expenditure of 20 per cent to 40 per cent The observed increase of heat elimination well illustrates the importance of choosing equipment to "fit" the worker

Influence of Climate as Distinguished from Fresh Air in Treatment of Pulmonary Tuberculosis and Its Complications J W Flinn Prescott Ariz—p 300

Results from Use of Subcutaneous Tuberculin Test—The conclusions drawn by Brown and Heise are based on a study of 324 patients subjected to the subcutaneous tuberculin test made with Koch's old tuberculin (O T) during a period of twenty-four years The use of the test produced no lasting untoward result and, given as advised, has only a very temporary effect on the patient, which, however is more usually favorable In only two instances did tubercle bacilli occur in the sputum for the first time immediately after the test Over 90 per cent of the seventy-five patients with a history of hemoptysis reacted to the tuberculin test About 90 per cent of 144 patients with dry pleurisy, and 90 per cent of ten patients with wet pleurisy, reacted positively to the tuberculin test Of forty-one patients studied by the roentgen ray, only three showed a positive increase of shadows Of 268 patients, only forty-eight showed an increase of rales during the reaction, and twenty-one a decrease The authors are convinced that the subcutaneous tuberculin test when positive proves tuberculous infection, but when accompanied by

definite clinical changes or more surely if manifesting an increase of roentgen-ray changes (focal reaction), indicates that the lesion is more accessible to circulatory changes and presumably less firmly cicatrized (healed)

Effect of Heat on Experimental Tuberculosis—Guinea-pigs were exposed to heat by Corper and Gauss for fifteen minutes at 50 C to increase the lymphocytes in the circulating blood Five days later these animals were inoculated with small doses of virulent human tubercle bacilli All the animals were sectioned forty days after inoculation Comparing the "heated" and "nonheated" animals, there was no distinctive difference in the anatomic distribution of the tuberculosis and in the animals that died there was no difference in the duration of life

Effect of Bleeding on Experimental Tuberculosis—Corper found that bleeding guinea-pigs in amounts of from 1 to 1 05 c c on alternate days, initiated a week before and continued practically throughout the entire period of infection (forty-one days), has no appreciable effect on the tuberculosis produced by small doses of virulent human tubercle bacilli (0 00001 and 0 0000001 mg) given subcutaneously to guinea-pigs as measured by the anatomic tuberculous involvement

Anomalous Position of Colon—In the case cited by Swezey and Black a loop of the colon was lying between the diaphragm and the liver It was discovered on roentgen-ray examination

*Late Cardiorespiratory Manifestations of Gassing as exhibited by Returned Soldiers F Smithies Chicago—p 77

Wassermann Test with Glycerolated Human Serum—Fifteen glycerolated human serums were kept by Reudiger in hermetically sealed glass ampoules in a dark place at room temperature for about two years, after which time they were as suitable for the Wassermann reaction as they were when fresh The results obtained with the syphilitic serums 2 years old were not quite identical with the results given by the same serums while fresh In some instances, the fresh serums gave stronger positive results than did the old serums, in other instances the old serums gave stronger positive results than did these same serums two years previously The nonsyphilitic serums gave uniformly negative results In two years' time these serums had become but slightly anticomplementary and reheating them to 56 C for thirty minutes removed the anticomplementary property without noticably affecting the result given by the Wassermann reaction All serums remained perfectly clear and sterile

Fibrillation of Ventricle—The two cases cited by Bishop direct attention to this rare and possibly early indication of a condition which might lead to sudden death Thus far, both of the patients are alive The ventricular tachycardia which these patients have shown is a serious influence toward causing sudden heart failure The rapid rate may tire out the heart if it continues for a long time or the tachycardia may lead to fibrillation of the ventricles with sudden death The cause is found to be a disease process of the ventricular muscle perhaps due to rheumatism, or some other degenerative influence

Pseudochylous Ascites in Syphilitic Nephritis—Striking features in Tuohy's case were the extraordinary number of tube casts found in the urine and the high content of albumin The unusually high blood count (5 110 000 red cell 9 400 leukocytes) The absence of cardiac hypertrophy or increase in blood pressure the finding of low sugar and creatinin and a fair phenolsulphonephthalein output usually suggestive of a fair prognosis picture otherwise of a wet nephritis finding of pseudochylous transudate association of syphilis The presence of ascitic fluid seemed to be merely a terminal condition

Calcium and Magnesium Metabolism in Osteomalacia—In the case cited by Freund during thyroid administration there was a marked increase in the loss of both calcium and magnesium After pituitary extract there was a still greater loss of calcium while the magnesium was scarcely affected During parathyroid administration there was a retention of both calcium and magnesium After removal of the ovaries there was a much greater loss of calcium and a slightly greater loss of magnesium than at any preceding observation

Cardiorespiratory Sequels of Gassing—Reviewing a large amount of material Smithies found that eighty-five patients were affected with some form of cardiorespiratory disorder in whom trauma from gassing could be proved and in whom the symptoms or signs of heart and lung malfunction were seemingly attributable to that gassing It is with the analysis of these eighty-five patients that this report is especially concerned

Use of Radium in Pelvic Tumors—The results of radiotherapy in 209 cases of cancer of the female genito urinary organs are given by Clark He believes it possible that with a further development of technic cancer of the cervix may be removed from the surgical domain In cancer of the fundus the results from surgery are too satisfactory to be abandoned in favor of radium although in the last four cases he has witnessed a very favorable outcome in patients in whom there were grave contraindications to surgical measures In two instances a cure appears to have been effected For patients therefore suffering with complications prohibiting an operation radium offers a decided hope

Technic for Amputation of Leg—Borchgrevink says the scar has to be so situated as to escape pressure from the prothesis Avoid ligating the large vessels which means interference with the nutrition of the flaps Separate the tendon of the biceps muscle and other soft parts from the fibula as close to the bone as possible without injury to it periosteum and without injury to the insertion of the same tendon into the external tuberosity of the tibia Every part of the stump ought to be covered by the fascia The tibia ought to be divided at the lowest possible point but no lower than 22 cm above the end of the stump

Anomaly of Circle of Willis—In the case cited by Homans the double anterior communicating vessel of the circle of Willis proved to consist of a single small artery and a parallel fibrous band The circle of Willis was in other respects within normal limits that is the posterior communicating arteries were of about average size The really important difference between this and the normal brains lay in the comparatively small size of the anterior carotids vertebrals posterior cerebrals and basil-

Division of Spinal Cord by Gunshot Wound—Cadwalader proves that complete division of the cord at the tenth thoracic segment by gunshot wound is not in itself necessarily fatal, for if automatic emptying of the bladder can be established, it is possible for the patient to live a comfortable chair life indefinitely Furthermore, it goes to prove that, even under the most favorable conditions for surgical procedure, return of function does not occur, for in this case the separated ends of the severed spinal cord were approximated by sutures within three hours after the injury, and after careful nursing for nineteen years no clinical sign of a return of function has appeared It can therefore be assumed that regeneration of the spinal cord does not take place after complete section and end-to-end suture

Fishscale Gallbladder—A fishscale-like condition of the gallbladder is described by Corkery as 'multiple small cysts of the mucosa" Grossly, the mucosa appears to be studded more or less profusely with cystlike bodies of 1 mm more or less in diameter These are nearly the color of normal mucosa A fresh specimen examined by Corkery strikingly resembled the scales of a fish On section, it became apparent that in this case no cysts were present There have been found and diagnosed thirteen cases of multiple cysts of the mucosa, in the last three years among a total of approximately 3 000 gallbladders removed in the Mayo Clinic at that time These, together with fourteen cases received directly from the surgeon, furnished the material for this study

New Herniotomy Technic—The modification described by Stetten is said to differ from all other procedures in that it utilizes, to the fullest extent, all the useful, available structures for the actual repair of the hernial orifice, without mutilation or distortion, and insures a maximum guarantee against recurrence Essentially, it consists in the overlapping of the external oblique aponeurosis beneath the transplanted cord and over the Bassini suture

Physiologic Study of Eustachian Tube and Its Related Muscles A R Rich Baltimore—p 206
*Hereditary Spastic Paraplegia V R Mason and W F Rienhoff Jr, Baltimore—p 215

Adenoma of Carotid—Three cases are reported by Reid He says that the slow growing pigmented tumor of the carotid gland, heretofore described as 'carotid body tumor' is a simple hyperplasia of a part or all of the normal gland, it should be designated as an adenoma or hyperplasia of the carotid body In rare instances a malignant condition may develop in it In some cases in which an operation is imperative on account of the size of the growth it may be wiser to do a decompressive operation than to attempt extirpation of the tumor Then after the tumor dislocates laterally and becomes more superficial, its removal will be easier and safer, particularly if the artery has been tied at the time of decompression

Reactions of Cerebrospinal Fluid—Cerebrospinal fluid from human and bovine sources in concentration gives physiologic reactions identical with those obtained from the injection of various tissue extracts, effects which Jacobson thinks most probably are due to the presence of histamin There is no definite evidence of the presence of a pressor substance in the cerebrospinal fluid suggestive of any posterior lobe secretion It seems rather improbable that the pituitary gland gives its secretion into the ventricles or into the cerebrospinal fluid All pituitary gland extracts show marked variability as far as their responses are concerned on intravenous injection They all show a depressor effect common to the tissue extract In general it may be said (*a*) Anterior lobe exhibits depressor effect mainly (*b*) Posterior lobe exhibit a moderate depressor effect followed by a specific pressor effect (*c*) Pars intermedia has a small depressor, followed by a pressor effect (*d*) Whole gland shows a neutralization of the depressor and pressor effects (*e*) The posterior lobe secretion, if it is a specific secretion, is most probably produced in the pars intermedia and finds its way into the pars nervosa The posterior lobe extract on intravenous injections appears to have an antidiuretic rather than a diuretic effect Glycosuria is produced by intravenous injection of posterior lobe extract in a number of cases This glycogenic effect is more marked in the rabbit

Fate of Bacteria in Upper Air Passages—Friedländer bacilli freshly isolated from various sources were introduced by Bloomfield into the normal upper air passages without producing local or general disease The organisms disappeared rapidly, usually within twenty-four hours It was not possible artificially to produce a carrier state The bacteria are removed by mechanical means This group of organisms when associated with disease usually act as secondary invaders

Hereditary Spastic Paralysis.—The four cases of hereditary spastic paraplegia reported by Mason and Rienhoff are of interest chiefly as examples of a rare hereditary alteration of the central nervous system which has affected members of one family for three generations The cases differ in minor details from others that have been reported, but in general may be considered as fairly typical instances of the disease

Canadian Medical Association Journal, Toronto

June 1920 **10** No 6

*Sciatica from an Orthopedic Standpoint J A Nutter—p 497
Traumatism of Spleen Report of Cases E L Connor—p 504

Medical Board Work on Psychiatric Cases H Dover—p 543
Occurrence of Acidosis After Anesthesia E M Ross—p 548
Prolongation of Life A H Wright—p 554

Therapy of Sciatica—The treatment of sciatica, Nutter says, depends on the cause Tonsils, if diseased, may need removal, abscessed teeth may need extraction, a chronic prostatitis may need treatment An arthritic spine needs fixation, a relaxed sacro-iliac joint should have efficient support, disease of the hip-joint calls for immobilization For the affected limb absolute rest is essential, pillow fixation, as a rule, being found useful The length of the period of rest will depend to a considerable extent on how successful has been the treatment of the cause of the disease For the pain, acetylsalicylic acid is useful, as also the salicylates and drugs of the coal tar class, such as acetphenetidin Morphin should be avoided wherever possible Counter irritation over the course of the nerve is valuable The Paquelin cautery is very useful but should be used only very superficially The application of mustard and the use of blisters may give relief The injection of sterile water, alcohol, or weak cocain solution into or beside the nerve, is not often practiced, as permanent damage may be done Nerve stretching is no longer in favor, and properly so In subacute cases, baking and massage will generally be found useful Hydrotherapy is sometimes of value but like electricity more often gives only temporary relief Anemia should be treated with iron and arsenic A special diet is indicated only in cases of gout, diabetes and rheumatoid arthritis of intestinal origin The injection of sterile water into the epidural space of the sacral canal has given relief which has lasted several hours or even longer

It is a procedure easy of accomplishment and unlikely to result in damage to the nerve

Infectious Diarrhea—The indications for treatment of this condition as summarized by Morgan are (1) neutralization of specific toxins by injection of a specific antitoxin if this is available, (2) correction of dehydration by saline or glucose injections, (3) prevention of formation of toxic products of protein putrefaction by administration of a food rich in carbohydrate, (4) specific therapy

Determination of Carbon Dioxid in Blood—In the Henderson-Morris method of determining the carbon dioxid of plasma or whole blood Haggard found that the various corrections almost exactly neutralize each other At ordinary temperatures and barometric pressures the reading on the gas buret for the carbon dioxid absorbed during the gas analysis (corrected only for the carbonate of the ammonia solution) may be taken as indicating directly within the error of the method the amount of carbon dioxid contained *in the blood or plasma* Each 0.01 c c corresponds to 1 volume per cent of carbon dioxid This method is particularly valuable for the determination of the carbon dioxid content and combining power of whole blood With it the analysis of whole blood is as easy as that of plasma

Chlorid Distribution in Blood—The influence of various carbon dioxid tensions on the distribution of chlorids between blood plasma and red blood corpuscles was experimentally investigated by Fridericia and the results are represented in curves showing conformity with the curve representing the carbon dioxid combining power of the blood at various carbon dioxid tensions Fridericia has been able to confirm with a different method the results of Van Slyke and Cullen's experiments on the influence of the carbon dioxid tension on the partition of the chlorids between plasma and red blood corpuscles Experimental evidence is presented to show that the cause of the exchange of chlorid ions and other anions between plasma and corpuscles is in the red corpuscles and *not in the plasma*

Determination of Vitamin—A method is presented by Williams which is based on a gravimetric determination and measures the growth of a very large number of cells rather than a few which have been isolated and hence the variations in results are not so large The vitamin content of any material can be rated in terms of milligrams of yeast produced under given conditions

Cystin Essential for Maintenance and Growth—The relative efficiencies in nutrition of casein a protein low in cystin content, and of serum albumin high in cystin content have been studied by Lewis in dogs Serum albumin under conditions of a low protein intake is more effective in maintaining nitrogenous equilibrium than is casein When casein is supplemented by cystin however it is as efficient for the maintenance of nitrogenous equilibrium as is serum albumin These experiments furnish additional evidence that cystin is essential for maintenance as well as growth

Hemoglobin and Methemoglobin Determinations—The method described by McElroy is based on the fact that while oxygen as is well known is liberated from hemoglobin by potassium ferricyanid it is not liberated from methemoglobin even in vacuo The total hemoglobin (hemoglobin plus methemoglobin) is determined colorimetrically as methemoglobin, using potassium ferricyanid to convert the hemoglobin into methemoglobin The oxygen capacity is determined by Van Slyke's method from which is calculated the hemoglobin only The hemoglobin as calculated from the oxygen capacity is subtracted from the total hemoglobin determined colorimetrically as methemoglobin The difference is the amount of methemoglobin

Antiscorbutic Properties of Raw Beef—Guinea-pigs were fed diets of oats water and an amount of milk sufficient to improve the diet but insufficient to prevent scurvy These animals developed scurvy and died When water extracts of raw lean beef were fed representing 5 10 15 and 20 gm of raw beef no differences could be noted in the time of onset of scurvy or in the length of life of the experimental animals Orange juice added to the basal diet prevented scurvy both in the presence and absence of meat extract The excellent condition of the animals on the orange juice-beef extract diet shows conclusively that the poor condition of the animals on the beef extract diet was due to the absence of the antiscorbutic vitamin rather than to any deleterious property of the beef extract

Manganese in Blood and Tissues—A method is developed by Reiman and Minot for the analysis of manganese in blood and tissue which is more rapid and has fewer sources of error than methods heretofore employed A series of results for the manganese content of human tissue obtained from fourteen necropsies is presented Manganese was found in all the tissue analyses the liver carrying the highest amount averaging 0.170 mg per hundred gm of wet tissue

Transfer of Agglutinins to Offspring—By examining the trasmission of the agglutinins normally occurring in the blood from mother to offspring in goats Reymann was able in only one case in fourteen to prove the recurrence, in all others the kids were born without agglutinin and probably derived it from the mother animal through the milk in which is to be found accumulated parturition From the milk as well as from the kid's serum it disappears in the course of a few days, then follows a period of a few months in which the blood of the kid is free from agglutinin and then it appears again probably in consequence of an immunization from the flora of the digestive tract The research was con-

cerned with coli and typhoid agglutinins, as well as agglutinin against rabbit and horse blood corpuscles

Botulism from Ripe Olives—Emerson and Collins suggest that menace to life and health from olive poisoning should be removed by adequate government supervision of the plants This supervision should include the fish packing and canning plants

Streptococci in Normal Throats—Of 134 average throats examined bacteriologically by Arnold 50 74 per cent were carriers of hemolytic streptococcus, and 91 per cent were carriers of nonhemolytic streptococcus One hundred and seventeen strains of hemolytic and eighty-seven strains of nonhemolytic streptococci were classified by Holman's classification

Streptococci in Throats of Influenza Patients—Of 116 cases clinically diagnosed as influenza, fifty-six were positive to hemolytic streptococci, making 48 2 per cent positive One hundred and sixteen cases were positive to nonhemolytic streptococci, making 100 per cent positive

Tethelin for Bed Sores—An instance of successful treatment by tethelin, a lipoid prepared from the anterior lobe of the pituitary body, of a case of delayed or arrested healing of bed sores which did not improve under any of the customary procedures is recorded by Carr Tethelin incorporated in a lanolin base was applied

Chaparro Amargosa in Endamebic Infections—Endameba gallinarum has with rare exceptions disappeared from the dark excrement of turkeys under treatment with chaparro amargosa or Mexican bitter bush This finding lends support to the results obtained by others in the treatment with chaparro amargosa of endamebic infections of man Trichomonads have shown no diminution, and apparently are unaffected by chaparro A coccidium, *Eimeria avium*, has disappeared in the majority of the treated turkeys

Bovine Tubercle Bacillus in Tuberculous Meningitis—Forty-eight strains of tubercle bacilli have been isolated by Novick from the cerebrospinal fluid of forty-eight clinical cases of tuberculous meningitis Three of the strains proved to be of the bovine type

Physiology of Wound Healing—An attempt is made by Loeb to explain theoretically the various phenomena measured during wound healing The reactions seen in wound healing are considered essentially as reactions of cells toward foreign bodies

Hypertrophy of Thyroid—The effect of homoiotoxins on hypertrophy of the thyroid, the changes in weight in the host as a factor in compensatory hypertrophy, and phagocytosis in the hypertrophic thyroid are discussed by Loeb and Hesselberg

Milk Injection Treatment of Infectious Arthritis—The experience which Schulman has had with parenteral protein treatment was almost exclusively with milk as the protein and with infectious arthritis as the disease, and is limited to about sixty cases He emphasizes that there seems considerable warrant in reports of clinical experience for the therapeutic use of parenteral protein, and that, although the method had its origin before there was satisfactory explanation of its mechanism yet approach to an understanding has been accomplished The method has met with considerable success in various forms of arthritis, but practically all the work reported outside of German literature has been with intravenous injection of bacterial vaccine The results which Schulman has obtained from milk have been gratifying in the great majority of cases with results that make him enthusiastic about its use in gonorrheal arthritis The method consists in injecting intramuscularly cow's milk that has been sterilized by boiling for about five minutes, and subsequently cooled to a comfortable temperature The initial dose for an average sized adult is 4 c c The injection is generally repeated every other day, and the dose is increased by 1 c c at every injection The total number of injections required varies with the individual case, and may be anywhere from two to ten The increase in dosage also is not a fixed and constant matter, but will depend on the degree of improvement and more especially on the severity of constitutional reaction that the patient shows To get any good out of the treatment a constitutional reaction must be produced The reaction following in intramuscular milk injection rarely comes on in less than one and a half hours The symptoms rarely last more than eight hours The treatment

is said to be applicable to all forms of infectious arthritis including acute, polyarticular rheumatism but in Schulman's experience gives the most brilliant results in gonorrheal cases

Kidney Function in Mercuric Chlorid Poisoning—The pathologic functioning of the kidney is said by Elwyn and Flood to be as follows With the insult to the kidney the tubular epithelium is necrosed, desquamated, and fills the lumen The kidney is swollen, the capsule is tense and constricts the vessels There is also possibly a reflex vasoconstriction This causes anuria Consequently all excretion products in the blood are retained and the level of the total nonprotein nitrogen and of various nonprotein constituents rises As the glomeruli or small vessels are not diseased the mechanism in producing hypertension is not called into play, or only slightly and in the later stages With the lessening of the swelling of the kidney, and the relaxation of the constricted vessels, filtration at once is resumed and the retained excretion products are rapidly removed Bowman's capsule has become permeable to the proteins of the blood, which appear in the urine these also coagulate and form the ground substance on which various cells are deposited with the formation of casts The blood in the urine originates in all probability from the bleeding capillaries of the necrotic tubules

Significance of Jaundice—Jaundice is a late symptom of gallstones in the majority of cases according to Mayo the result of neglect to recognize the condition or to advise operation in the preventive period The mortality following cholecystectomy in the treatment of cholecystitis with or without stones is low only 1.8 per cent in 2,460 operations performed during a period of three years There were 337 cases in which cholecystectomy and choledochotomy were both done with a mortality of 3.2 per cent In a group of thirty-six cases of very serious obstruction and malignancy cholecystotomy and choledochotomy were done with a mortality of 16.6 per cent Choledochotomy alone was done in a somewhat similar group of forty-seven cases with a mortality of 15 per cent If all the choledochotomies are grouped together however the mortality in the 420 cases is but 5.7 per cent too high a mortality for simple cases of stone and obstruction and too low for the late and complicated cases including the cancers Stones were found in the common duct in 274 of the 420 cases

Resection of Double Kidney—To four other reported cases of resection of double kidneys Herrick adds one

Spermatozoa in Hydroceles—Six cases of hydroceles containing spermatozoa and one of true spermatocele associated with hydrocele are recorded by Winslow He thinks it probable that in some cases at least true spermatoceles rupture into hydroceles and in that manner permit the ingress of spermatozoa into the sac of the tunica vaginalis

Short Umbilical Cord—In Bacon's case the entire length of the cord was only 43 cm It was coiled twice around the neck of the child The distance from the navel of the child twice around its neck to the clavicle was 56 cm

Wiring Fractures—In this method a silver or copper wire of proper gage is passed through drill holes made through both fragments and caught by forceps at each end The wire is drawn taut in opposite directions so as to hold the fragments firmly in accurate apposition This procedure brings the terminal portions of the wire in lateral and parallel contact with each other Over the adjacent parallel wires a

small quantity of liquefied zinc chlorid is applied, and, while tension is exerted on the ends of the wire, the adjacent parallel portions are soldered together by merely running the tip of a soldering iron over them This method is indicated when it is necessary to hold a small fragment in apposition with a larger fragment, and when it cannot be done by the closed method

*Effects of Radium Treatment on War Injuries in Neighborhood of Nerves W C Stevenson—p 862
*Poisoning by Arsenobenzol Compounds Used in Treatment of Syphilis A G R Foulerton—p 864

Diagnosis of Spinal Cord Diseases—Mott emphasizes the necessity of determining by examination whether the case is functional or organic and if organic, in order to form a correct judgment regarding prognosis and treatment, it is essential to diagnose the pathologic nature of the lesion and its anatomical situation The recognition of functional sensory disabilities simulating spinal cord disease is easy the superficial sensibility to pain, heat and cold and touch is lost completely, there is no dissociation, neither the anesthesia nor the pains complained of conform to the anatomic distribution of spinal roots or peripheral nerves The secret of success in the treatment of these functional cases is faith It may take minutes, it may take hours However, among the very numerous cases of functional disability there are many cases of organic disease of the spinal cord with a large halo of functional disturbance, which can be removed by various methods of suggestion, by reeducation and various other forms of encouragement But the fact must not be overlooked that such a patient, in spite of the satisfactory results of such treament, is suffering with a permanent disability, which may progress in spite of improvement by the treatment

Radium in Nerve Lesions—While radium cannot benefit gross nerve lesions, Stevenson found that after a nerve operation or after milder degrees of nerve trauma it appears to aid and to hasten the return of function in a limb It improves the nutrition in the area supplied by injured nerves It may be useful as an aid to diagnosis and in certain cases will indicate or contraindicate the necessity of operation It is a valuable adjunct to other forms of treatment

Poisoning by Arsenobenzol Compounds—Sixteen cases are analyzed by Foulerton In seven cases it was possible to make a microscopic examination of the liver and kidneys after death In nine cases the appearance of jaundice was followed rapidly by death in patients who were either under treatment with kharvisan or for whom the course had already been completed Nothing is known as to the actual condition of the organs in these nine cases The factors of dosage and time appear to have quantitatively but little determining influence on the final result Whether the symptoms appear rapidly after a few doses—or whether they are delayed for six weeks after the completion of a full course of treatment—the final result is the same in the large majority of fatal cases jaundice hematemesis delirium and coma with death within three, four or five days Experiments were carried out to determine whether the benzene constituent has any influence in aggravating the toxic effect of the arsenic The experiments included the injection of rabbits subcutaneously with (1) arsenic oxid (As_2O_3), (2) with the benzene constituent (ortho-amido-phenol) with which the drugs are compounded (3) with arsenobillon and (4) with kharsivan In all of the experimental cases there was a nephritis in addition to the hepatitis The action of the poison, in large amounts on the parenchyma cells of both liver and kidney, appeared to be severe The results of poisoning with the two arsenobenzol drugs were comparable histologically with those obtained in the less acute cases of poisoning with arsenic oxid It appears that the results characteristic of poisoning by arsenobenzol compounds may be produced by the action of arsenic alone The fat metabolizing functions of the liver are directly affected by the action of arsenic oxid in poisonous doses But in view of the serious damage to the liver and kidney tissues in experimental poisoning with ortho amido-phenol it is impossible to ignore the probability that the toxic action of the arsenobenzol drugs may be influenced to some extent by the benzene constituent Foulerton considers it advisable that the use of mercury in conjunction with arsenic should be discontinued, the more especially so in that it is difficult to understand in what way the additional treatment can have any useful effect under the conditions It is very evident, that there is a certain definite risk in treatment with arsenobenzol compounds It is impossible to express the risk in any individual case in the terms of a percentage, but the danger is sufficiently real to suggest that a man who is going through a course of treatment should be kept under careful medical regimen throughout the period of administration of the drug and for some weeks afterward

*Case of Extensive Resection of Small Intestine W Q Wood—p 61
Critical Review Cerebral Ventricular Hemorrhages at and Soon After Birth—J W Ballantyne—p 63

Influenzal Pneumonia Causing Hyperthyroidism.—Petren noted that after influenzal pneumonia a condition of hyperfunction of the thyroid gland may occur, and that it is associated with many of the ordinary symptoms, though exophthalmos and the rise in the relative number of lymphocytes in the blood are absent These cases are neither instances of vagotonus nor of sympaticotonus, for they have reacted promptly both to pilocarpin and atropin and also to epinephrin

Extensive Resection of Intestine—In a case of strangulation of a large umbilical hernia, 7 feet 2 inches of gangrenous bowel were resected from the lower part of the ileum Wood says the surgeon need have no hesitation, from fear as to the effect on metabolism, in removing at least a third of the small intestine

Bone Grafting Fractured Jaw—Sixty consecutive cases of bone grafted mandibles are reported by Chubb Of these all but two were free autogenous grafts from the ilium Fifty-one possessed edentulous posterior fragments, and in forty of these the loss involved the region of the angle In sixteen of the latter the loss involved the ascending ramus also Firm bony union was obtained in fifty-six of the cases, 93 per cent of the series

Paratyphoid C Bacillus Vaccines—From experimental data it is concluded by Dudgeon and Urquhart that as an antigen for the preparation of typhoid and paratyphoid (A, B and C) agglutinating antiserums the heat-killed and formol-killed vaccines are of greater utility than the acid dextrose if the subcutaneous method of inoculation is employed but the acid dextrose vaccine gives an equally good result if paratyphoid vaccines are injected intravenously

Skin Sensitivity to Tuberculin Test—The multiple papillary cutaneous test of Ellis is regarded by Luker as a reliable time saving, tentative method of preliminary sifting of cases into such classes as (*a*) Clinically active, (*b*) doubtful, (*c*) quiescent (*d*) nontubercular Though the test results of these carefully determined minimal effective doses furnish no reliable data as to the amount of lung involvement, yet they give some criteria as to the toxemia present. The test is a valuable guide in estimating the threshold of probable reactions to Koch's hypodermic test or the optimum commencing dose in tuberculin treatment In the routine examination of individuals presenting no obvious defects an intradermal injection of 0 0001 c.c old tuberculin compared with a similar control of physiologic sodium chlorid solution would serve as a quick reliable way of differentiating candidates into clinically affected and doubtful classes

Functional Insufficiency of the Liver M Labbe and H Bith—p 138

Diabetes and Exophthalmic Goiter—Labbe reports five cases which confirm the possibility of diabetes of thyroid origin In a series of experiments on rabbits sometimes thyroid treatment reduced the capacity for sugar combustion other times it increased it, in others thyroidectomy had a similarly variable effect The hyperthyroidism exaggerates the nitrogen metabolism and this explains the special tendency to acidosis Iodin seemed to have a favorable action on the palpitations tachycardia and glycosuria The sugar in the urine dropped from 208 to 71 gm in a month in one case under iodin while the general health improved The data presented confirm the assumption that the thyroid has something to do with carbohydrate metabolism

Purpura with Meningococcemia—Renault and Cain present evidence that the purpura is a manifestation of septicemia and that the diagnosis can be made by cultivating the serous fluid from the purpuric lesion or by histologic examination of a scrap of tissue from it

The Debut of Tuberculosis—Debre and Jacquet analyze the conditions in three infants known to have been contaminated by the mother at a certain date The period before the infant became capable of responding to the intradermal tuberculin test was shorter the older the infant and the greater the amount of tubercle bacilli involved During this *periode anergique* as they call it there are absolutely no clinical manifestations to attract attention to the infection The minimum period seems to be six days and the maximum judging from their experience, is four months

Influenzal Meningitis and Meningism T Reh—p 361

Active Immunization Against Diphtheria—This communication from Leyden states that 375 children in a school where there had been twenty cases of diphtheria were injected with a mixture of diphtheria toxin and antitoxin and the production of antibodies was supervised by the Schick test Preceding this attempt at active immunization nine teen adults had been treated and controlled in the same way Of the 271 children who showed a positive Schick reaction before the

injections, it became completely negative in 138 and dubious in 49, but persisted positive in 40 In the 104 with a previous negative Schick reaction, it persisted negative in all It is thus possible, without risk for the children, to increase the antitoxin content of their serum by injecting diphtheria toxin not completely neutralized with the diphtheria antiserum The antibodies appear in the serum about three weeks after the beginning of the immunization, and disappear from the blood in about a year and a half or two years The antibody content can be supervised with the Schick reaction, but the Romer method is superior for the direct determination of the antitoxin in the blood When the vaccinated children had lost the antibodies from their blood, by the end of the second year, a new injection of the toxin-antitoxin induced a remarkably sudden production of antitoxin suggesting that the cells had acquired immunity against diphtheria

Respiratory Insufficiency of the Apex—Summarized July 24, 1920, page 276 when published elsewhere

Hip Joint Disease After Ingestion of Large Amounts of Hexamethylenamin—Marie and Behague report two almost identical cases The young men were prisoners in Germany, and they both took clandestinely large amounts of hexamethylenamin to induce factitious hematuria They secured the desired exchange as advanced renal tuberculosis was diagnosed Each took repeatedly a daily dose of 100 gm The intense and painful hematuria which followed subsided two or three days after suspension of the drug Both seemed to be entirely well after their return to France, but each developed ten months or eighteen months later, arthritis of both hip joints, without effusion, which has seriously crippled them both and shows no signs of improvement In the discussion, Netter mentioned that in five cases he had seen hematuria follow hexamethylenamin in fractioned doses of 1 or 2 gm daily Bazy recalled that hexamethylenamin is the discovery of Bardet, a French physician, who named it formin

Intracranial Complications of Otitis—Moure urges tentative treatment as for syphilis when otitis media and mastoiditis display certain unusual features or are particularly tenacious In several cases the functional disturbances persisted after the mastoiditis and otitis were evidently healed and the Wassermann test gave positive findings, except in one case, but in all, the treatment for syphilis was followed by a prompt cure A recurrence in one case confirmed his diagnosis as necropsy revealed the softening of a gumma in the cerebellum as the cause of the fatal acute meningitis

Edema—Achard remarks in the course of this study of the treatment of edema in general, that abstention from salt does not seem to influence the dropsy unless the subject is taking food Those who are not eating and drinking—although thus abstaining completely from salt—do not lose their edema It seems to be necessary for resorption of the fluid for the organism to be doing a certain amount of nutritional work, indispensable for the play of the interchanges He says that of all the drugs advocated in treatment of edema, theobromin and digitalis are the only ones that we should retain He never obtained any results with Pathault's method of applying to the limbs compresses dipped in a very strong solution of salt, aiming to draw the excess of fluid out through the skin The reabsorption of large amounts of edema fluid has sometimes induced nervous disturbances, headache, torpor, convulsions and even hemiplegia He had one case of transient paralysis during a medicinal diuresis in heart disease They usually subside harmlessly, but have been known to prove fatal Various theoretical explanations have been proposed

Paradoxes of Edema—Ameuille queries among other things why certain edemas seem to escape the action of the laws of gravitation while others obey them so closely, way the condition in chronic edema often varies from day to day when conditions seem identical in other respects, and why edema in some subsides under abstention from salt and in others keeps up or even increases

Incision of Cervix to Promote Delivery—Cathala gives a diagram which shows the location of the incision according to the existing degree of dilatation of the cervix Properly done this means of facilitating delivery may render inestimable service without risk for the mother when the prolonged labor and beginning infection etc, are threatening the life of the child Before incising the cervix it is important to make sure that the fetal head can pass the zone in question without stretching it There is no chance for laceration of neighboring organs or hemorrhage or infection if the incisions are made on the median line and intravaginal One of the fourteen women he has thus treated has passed through another pregnancy since without mishap He cuts the cervix with straight scissors from the external os to the junction with the vagina stopping 1 mm short of the mucosa of the vagina In his earliest cases he sutured at once, but now sutures at the end of childbed unless he finds the parts perfectly healed The incisions shrink to insignificance with the involution of the cervix

Incision of Cervix During Delivery—Olow reviews the arguments for and against surgical procedures to promote delivery, and describes his own method He cuts the anterior lip of the cervix to the vaginal fornix and continues the incision on the anterior wall of the vagina for several centimeters With the finger the bladder is detached and the cervix cut still higher and so on, until the peritoneum of the vesicovaginal culdesac comes into view If this is not considered sufficient for the child to pass, the posterior lip of the cervix is cut likewise The upper end of the incisions is reenforced with a buried stitch the assistant pulling on the threads After delivery of child and placenta, the upper end of the incision is drawn down with the thread, and other stitches are taken to reconstruct the parts, leaving a wick to drain and suturing the vaginal incision There is so little sensation in the region that general anesthesia is not indispensable, merely a little ether for the delivery proper, but as a rule he gives ether from the start to the last suture It takes very little This technic avoids danger of laceration from stretching

*Astragalectomy E Villard and E Perrin —p 36
*Hydatid Cysts of Lung G Pelissier —p 77
*Tendon Heterografts Jalifier —p 97
*Perithyroid Sympathectomy R Leriche —p 109

Innervation of the Biliary Apparatus—Latarjet and his co-workers have been making a special study of the visceral innervation, and describe here their findings, with seven illustrations, so far as the liver and bile ducts are concerned Surgeons pay little heed to the nerves in operating in this region but certain postoperative mishaps may be traceable to avoidable section of some nerve

Astragalectomy—Villard and Perrin give an illustrated description of twenty cases in which the astragalus was removed to correct a vicious attitude of the foot especially varus equinus The results were ideal in many, far surpassing those obtainable by operations on tendons or joints The secret is to suture at once and be persevering in the after-treatment, as the whole comes under the head of orthopedic procedures

Hydatid Cysts of the Lungs—Pelissier has encountered 12 cases of hydatid cyst in the lung in four years at Alger, in 2 of the cases a spontaneous cure followed the bursting of the cyst, the outcome is not known in one case and in another the man died after operation on a concomitant cyst in the liver In the 8 other cases recovery followed operative treatment but recurrence is probable in 2 The others are clinically normal The report in detail is illustrated

Tendon Grafts—Jalifier says that there was no failure in the five cases here described in which he implanted tendons taken from the leg of a calf or dog from six to fifty days before The functioning of the hand is fairly good or very good in all

Perithyroid Sympathectomy for Goiter—Leriche resected the sheath of the superior thyroid artery, from its origin to the pole of the thyroid gland in a young man with parenchymatous goiter from childhood The artery shrank in size at once and also the external carotid, the sheath of the latter having been resected likewise for a short distance The connected lobe of the thyroid seemed to be congested at first but then it began to melt away, as it were By the end of the month there was nothing left to palpate while the enlarged lobe of the other side was of the same size as before Before doing the sympathectomy he enucleated three small nodules in the median region of the thyroid, they shelled out readily with scarcely any damage to the gland so that this preliminary median procedure cannot be credited with the retrogression of the lobe on the side of the denuded artery The results in this case he reiterates, justify further intervention of the kind to modify goiters

Allowing Parturients to Get up Early L Devraigne—p 434

Pyelonephritis in the Pregnant—Couvelaire says that the attenuated form is frequently misinterpreted as slight albuminuria is the only symptom but it calls for relative repose, dieting and castor oil The febrile form usually subsides in a week or two and the pain in the kidney disappears under copious drinking purgatives, and antiseptics eliminated by the kidneys When the fever persists, indicating retention, if the kidney is not enlarged he injects into the bladder tepid solution of boric acid and has this retained as long as possible, repeating this three times in the twenty-four hours This sometimes rouses the ureters to contract and evacuate the purulent urine If not do not wait too long before catheterizing the ureter If this is not practicable evacuation of the uterus may restore clinically normal conditions Otherwise operate on the kidney This must also be the rule when the kidney is much enlarged as this implies mechanical obstruction After delivery the woman must be kept under supervision for a long time

Pituitary Treatment in Obstetrics—Pouliot emphasizes that any mechanical cause impeding delivery is a contraindication to pituitary treatment If the treatment whips up the uterus too vigorously, this may induce tetanic contraction He advises never to give more than what corresponds to 0 10 gm of the fresh gland and to give it by intramuscular or subcutaneous injection and not to repeat the dose unless the action of the first is exhausted allowing an interval of two hours at least Other contraindications include everything causing compression of the cord as with breech presentation, or premature rupture of the membranes By heeding these rules pituitary treatment will not be held responsible for mishaps for which it should not be incriminated

*Pneumococcus Antiserum H C Sloboziano—p 439
*Syphilis and the Endocrine Gland E Schulmann—p 442

Antipneumococcus Serotherapy—Sloboziano's article is mainly devoted to American experiences in this line but he adds that the French have extended the field for serotherapy to many of the complications of pneumococcus infection especially in mixed meningitis Combinations of antipneumococcus and antimeningococcus or antistreptococcus or other serums have proved remarkably effectual in the hands of Dufressine Nobecourt and Lassance and Apert uses them to ward off lung complications in measles and whooping cough

Syphilis of the Endocrine Glands—Schulmann concludes from his review that some derangement of some endocrine gland is responsible for all forms and cases of malformation and abnormal growth Whenever there is a possibility that syphilis is responsible for the endocrine derangement—and this is far more common than generally realized—prompt treatment may ward off further damage attacking the pirochetes with swift and vigorous blows and combating the dystrophy with potassium iodid and organotherapy The intensity of the treatment must be gaged for the patient and the glands involved special caution is necessary with suprarenal insufficiency as any arsenic preparation by the vein might bring on acute disturbance from the superposed poison

Management of Minor Wound L Berard—p 373
Unrecognized Fractures of the Patella I Moreau—p 374
Subcutaneous Injection of Neo Arsphenamin A Loubat—p 376

Management of Minor Traumatisms—Berard urges that the war experiences have taught the necessity of antitetanus serum with even small wounds and that this lesson should be applied now even to the minor injuries of children's falls We know that the tetanus bacillus may get a foothold even in an erosion of the epidermis scarcely visible to the naked eye In case of doubt especially of injury of the hand feet or face soiled with gravel debris of wood or manure it is better to be on the safe side and inject the antiserum A preliminary injection of 1 or 2 c c a few instants before the main injection of 10 c c will ward off minor serum by effects Whether the antiserum is given or not the wound should be cleared of every particle of devitalized tissue under local anesthesia, if necessary and blister- emp- -rgoing by

watering freely with a 1 per cent alcoholic solution of iodin and then wiping dry the entire wound. This immediate and complete surgical toilet of all injuries, even the apparently most harmless, will not only ward off tetanus, but also the whole train of tendon sheath phlegmons, felons, lymphangitis, erysipelas, etc., which are still far too common.

Fracture of the Patella.—Moreau relates that in a series of ten cases the fracture of the patella had escaped detection, in two cases fracture is claimed but cannot be proved and in three other cases an anomaly in ossification is responsible for the disturbances. He describes the special measures required for differential diagnosis.

Radial Paralysis of Malarial Origin.—Fonzo lists from the literature the cerebral, spinal and peripheral nervous disturbances for which malaria may be incriminated, and reports two cases in children of 7 and 12 in which the right hand showed the effects of typical radial paralysis. It persists rebellious to treatment in both. Fonzo admits the malarial anemia as a predisposing cause, but ascribes the paralysis to the malarial toxin.

Streptothrix Meningitis.—The 9 months' infant with inherited syphilis developed the meningitis after pneumonia and the streptothrix was found in the spinal fluid. Rutelli has reported a similar case in an infant, and Sindoni six cases, but in five in this group the invasion was evidently secondary in already established meningitis. Kharina has also published a case in an infant of 13 months, in this case as in Fabris', the meningitis had been preceded by pneumonia.

*Persisting Slight Fevers. A. Ricaldoni.—p. 158
*Thyroid Treatment of Hemorrhagic Syndrome. L. P. Bottaro and J. C. Mussio Fournier.—p. 191

Stenosis of the Duodenum with Pancreatitis.—Navarro's case, he states, was one of the first of hypertrophy of the pancreas ever published, and the first in which the stenosis of the pylorus was traced to this cause. Gastro-enterostomy was done for the stenosis, and reexamination of the woman twenty-one years later has confirmed the correctness of the diagnosis and the benefit from the treatment. He summarizes ten cases from the literature and three others in which the pancreatitis developed in an annular pancreas. In one of the latter, hematemesis and the pyloric syndrome were traced exclusively to the pancreatitis. The records show that with the pancreatitis causing the pylorus syndrome, the biliary passages were absolutely normal, even in the three cases with great enlargement of the pancreas. An instructive symptom of pancreatitis is the drop in the pulse of eight or ten beats when pressure is applied to the pancreas region. This symptom suggests abnormal conditions in certain ramifications of the solar plexus. One child was in the habit of leaning the abdomen against the edge of the desk, and there was hypertrophic pancreatitis. Besides the modification of the pulse, pressure on the spleen brought on vomiting, even when the pressure was not pronounced enough to elicit pain. Villar's patient was a new-born child and the laparotomy disclosed annular pancreas and atrophy of the duodenum, but the infant recovered after gastro-enterostomy. Separating the duodenum from the pancreas might be useful to supplement gastro-enterostomy.

Febriculas.—This is Ricaldoni's term for persisting slight fever and he warns that the temperature may transiently fluctuate a little in the healthy and the normal level may be a trifle higher than usual in some persons. There is never a wavelike or cyclic course as with true fevers. He warns further to be on the alert to detect factitious fever, and he then passes in review the true febriculas, saying that while tuberculosis is the most frequent cause, yet it is frequently incriminated erroneously.

Hemorrhagic Tendency Cured by Thyroid Treatment.—Summarized July 17, page 207, when published elsewhere.

*Intradermal Tuberculin Treatment of Pulmonary Tuberculosis in Children. J. Garcia del Diestro and B. Cordero.—p. 65. Begun in No. 1, p. 5.
Disease of Epiphysis. Three Cases. Rioseco.—p. 85.

Tuberculin Treatment of Children.—Garcia and Cordero found the subcutaneous injection of tuberculin difficult and dangerous for various reasons, in dispensary treatment of children in their ten years of experience. The intradermal injection by the Mantoux-Jeanneret technic, is comparatively free from these objections and they have been applying this method for three years. They give here the minute details of nine cases and assert that it is the best method for administering tuberculin to children who cannot be kept under strict control, it is much more harmless than the other technics while it is as ineffective as any of them in respect to the tachycardia and the fever and—aside from exceptional cases—has no or only very slight effect on the focal phenomena when the focus is at all advanced. But the tuberculin administered in this way had very often a favorable influence on the weight, the anemia and the appetite. The injection was made once a week, supervising the local reaction and the temperature and weighing the child once a month at least. The weight is the most reliable criterion of the benefit or harm from the tuberculin treatment.

Courvoisier's Law. Leonidio Ribeiro Jr.—p. 171
Preventive Antitoxin Treatment of Diphtheria. C. de Rezende.—p. 172

Lumbar Puncture in Syphilitics.—Clark declares that he hopes soon to see the ultramicroscope in universal use as the early diagnosis of syphilis, which is possible only with this, will permit the immediate and complete cure. In neurosyphilis, the meningeal processes are accessible to treatment, but the early clinical cure is liable to be only apparent unless the spinal fluid is found normal on reexamination once or twice a year. The meningeal lesions require early, vigorous and prolonged treatment. When this is the routine practice, we may hope to see tabes and general paresis diagnosed in time for a cure. He reiterates that the Argyll Robertson and similar signs are of no use for the early diagnosis. Clark knows of sudden deaths from lumbar puncture on the seated

patient In three cases tabes assumed a fulminating course after lumbar puncture, tabetics are not able to stand any form of traumatism He has also seen cases of intense gastralgia persisting for a week, after lumbar puncture, in other cases a condition simulating meningitis Ten cases of syphilitic meningitis are described, some of the patients have been apparently cured under vigorous treatment applied early

Chenopodium in Local Treatment of Tropical Ulcer N Botafogo Gonçalves —p 267

Access to Semilunar Cartilages and Crucial Ligaments—Brandão makes an incision at each side of the joint after turning back a U flap of skin Then he saws the patella, sawing out a pear-shaped piece on a broad pedicle the outline suggesting a doll's head and shoulders Turning back the interlocking halves of the patella with its ligament allows ample access to the entire joint and when the parts are replaced they automatically fit together as in a mortise The more strain on the joint, the closer the coaptation Five illustrations show the procedure which has been worked out on the cadaver with no clinical experience to date.

Temperature of the Cerebrospinal Fluid—Lopes has found that the lumbar puncture fluid is usually a tenth of a degree below the axillary temperature and nearly five tenths below the rectal temperature He suggests that it might prove useful for diagnosis and for intraspinal injections to know the exact temperature of the cerebrospinal fluid A thermometer might be devised to be introduced like a guide inside a needle or tube

Vaccination Against Typhus—Mollers and Wolff state that an effective immunity such as follows recovery from typhus cannot be brought about in guinea-pigs by means of injections of killed typhus virus as they have shown by experiments the results of which have recently been confirmed by Dorr and his co-workers The unsatisfactory experiments with the inoculation of humans are in accord with the animal experiments There is no persisting active immunity against typhus without the preceding specific infection process Analogous to the successful inoculations in other diseases (cattle plague anthrax swine erysipelas) vaccination by injections of living typhus virus mixed with immune serum seems to offer the best chances of success though typhus virus attenuated in some other manner—as in vaccination against smallpox—might also be successful

Subacute Atrophy of Liver, with Ascites, in Relation to Cirrhosis of Liver—Strauss found complicating ascites in over 20 per cent of the cases of atrophy of the liver, and that such cases have a special differential diagnostic interest He also finds from studying a case of his own which he gives in detail and other cases from the literature that there are marked points of contact between subacute atrophy of the liver and atrophic cirrhosis of the liver This may justify the conclusion that the ascites is due to obstruction of the circulation in the region of the portal vein He thinks that these relationships deserve further study both from the clinical and the pathologic anatomic standpoint

Operative Treatment for Habitual Luxation of Patella—Drever describes his method of operating for habitual and chronic luxation of the patella which he has found eminently satisfactory The muscular traction pulling the patella out of its proper place is arrested by cutting across some of the fibers of the vastus externus about 7 cm above the patella and twisting this bunch of fibers at right angles to its former course, and suturing it to the vastus medialis The traction on the patella is then in the opposite direction from before

Rhinologic Hints for the General Practitioner G Finder —p 524

Prophylactic Postoperative Treatment of Cancer—Blumenthal finds that raying of the field of operation can only destroy remaining cancer cells but does not

prevent recurrence The local tendency of the tissues to cancer production still remains Irradiation must be sufficiently intensive, for by inadequate excitation avirulent cells may become virulent It might be better, after operation for cancer of the breast to ray also the sternum, the pectoral region and the supraclavicular and infraclavicular fossae At first the sittings should be four weeks apart, later three months Irradiation may have to be continued indefinitely He has found that small recurring nodules in the skin sometimes react better to radium or mesothorium than to the roentgen rays In all operative cases of breast cancer the healthy mamma must be carefully controlled We should not trust in postoperative irradiation alone, but should use all other therapeutic means arsenic (intramuscularly or intravenously), extracts made from the tumor removed at the operation and autogenous exudates

Intracranial Injections in the Treatment of Trigeminal Neuralgia—Hartel has used this method for seven years and his fifty cases show that a permanent cure of trigeminal neuralgia can be effected by means of intracranial injections of alcohol Permanent analgesia of all three branches of the trigeminus assures a permanent cure He has observed cures *of over seven years' standing following a single injection* In case only partial analgesia is established, recurrences can be expected The recurrence can be cured by repeating the injections In hysterical cases and cases of doubtful diagnosis, intracranial injections should not be given Partial analgesia, omitting the ophthalmic nerve, is technically possible, and is indicated in mild cases in order to spare the cornea, in spite of the fact that this exposes to recurrence He sometimes determines in advance, by means of a roentgenogram, the size of the foramen ovale and whether there are any anatomic peculiarities in that region In 41 cases thus treated over six months ago a complete success was realized in 21 and partial analgesia in 16, 25 have been free from recurrence to date, the intervals since from seven to two years in 13

Experiences with the Third Modification of the Meinicke Precipitation Test—Schmidt and Pott say that in view of the simplicity of this test it should be applied to every serum or spinal fluid, as it seems to be marked by almost as high a degree of specificity as the Wassermann reaction

Significance of the Findings in the Renal Pelvis Urine for the Diagnosis of Pyelitis Gravidarum—In investigating the pelvic urine of twenty-four pregnant women, Zimmerman reached the conclusion that the degree of turbidity of the urine and the number of leukocytes and epithelial cells do not furnish a reliable diagnosis for pyelitis gravidarum for the reason that the casting off of epithelial cells into the urinary passages and the elimination of leukocytes into the urine appear to be normal physiologic processes during pregnancy

Experience with the Dahne-Haschke Artificial Leg—Meinshausen thinks that this apparatus marks a step in the right direction in the problem of proper prosthetic appliances after amputation of the thigh, although it is by no means ideal Orthopedists and technicians should labor to perfect the apparatus still further One disadvantage of the appliance is that it requires a new socket after a time—in fact, *rather soon, as the musculature of the stump changes its* shape as the fat is absorbed and exercise strengthens the muscles

Postoperative Roentgen Treatment of Cancer—Strauss concludes from his review of the literature on this subject that it is still a question whether postoperative raving is really of advantage or not It is important to collect extensive statistics and ascertain the forms of cancer best suited for it Strauss' own experience has been very favorable

Organotherapy in Skin Disease—Pulay's deductions from what has been published on the relations between skin diseases and the sexual glands are that there is no evidence of any direct connection between disturbances in the genital sphere and abnormal conditions in the skin with the exception of certain anomalies in the growth of the hair He cites *also the falling out of the hair sometimes noted with* uterine fibromyomas and the rapid growing in of the hair again after these tumors have been removed, also the subsidence of seborrhea during a pregnancy On the other hand, the mineral metabolism has undoubtedly something to do with skin diseases Mosse found that ovarian treatment of castrated animals induced pronounced diuresis while the phosphorus content of the urine declined Matthes found increased elimination of phosphorus and lesser output of calcium and magnesium salts under ovarian treatment, after castration the output of each was increased These findings suggest that ovarian treatment might modify certain dermatoses by its influence on the calcium and magnesium metabolism Ischovezco has also apparently established that all organs rich in lipoids like the endocrine glands, are stimulated to extra functioning when lipoids from the same organ are incorporated He injected rabbits with lipoids from the uterus and noted that the uterus became hypertrophied He also noticed an antagonistic action between lipoids from the corpus luteum and from the suprarenals *In conclusion Pulay refers to pityriasis rosea at the meno-*pause as an instance of a skin disease in which changes in the genital sphere are certainly an indirect factor, to some extent at least

By-Effects of Phenolphthalein—Silberstein took a single dose of a phenolphthalein purgative, and plaques developed on his tongue suggesting cancer and forcing him to give up smoking A year later he took another dose and developed a painful stomatitis with herpes on the genitals A woman consulted him recently for general lassitude loss of appetite and a strip of ecchymosis in the conjunctiva of both eyes She had taken seven tablets of a phenolphthalein preparation He warns physicians not to be misled by these consequences of the abuse of this drug

Operative Treatment of Tabetic Gastric Crises—Holfelder says that it now seems to be fully established that the cause of the gastric crises in tabes is an isolated pathologic condition of the sensory nerves of the stomach The motor phenomena are from reflex action By destroying the sensory nerves we put an end to the crises, and there are a number of ways in which this can be done The nerves can be temporarily blocked with paravertebral injection of procain, and this is his practice when the patient is too debilitated to stand thorough operative measures The effect is immediate, but lasts only a few days, it can be repeated, while the patient is regaining strength for the Foerster operation This he regards as indicated in all cases of pronounced gastric crises in which the participation of the vagus can be excluded The latter can be suspected from the epigaster reflex and the coincident disturbances on the part of the heart and larynx In this case treatment requires subphrenic severing of the terminals of the vagus at the cardia, according to Exner But in the majority of cases, the sympathetic fibers in connection with the splanchnic nerves are the ones involved, and these can be severed at the only point where

they can be isolated, namely, at the posterior roots It is necessary to resect the nerves from the fifth thoracic to the first or second lumbar spinal nerves This is done under local anesthesia the patient lying face down the head low with a few whiffs of ethyl chlorid as the roots are severed The suturing of the dural sac is the most difficult part of the operation, but it can be and must be done liquid-tight As the motor function of the stomach is paralyzed by the operation, it is indispensable to conclude the intervention with gastro-enterostomy

Subchronic Lethargic Encephalitis C Economo —p 371
*Extrasystoles R Singer and H Winterberg —p 391
*Cholesterin in the Blood M Richter Quittner —p 425

Dilatation of the Heart—Kaufmann was in charge of the Vienna military "heart station" where roentgen-ray records were taken of 70 000 men with heart symptoms Of the 500 beds 100 were constantly in use in treatment of abnormally large hearts In the great majority the heart was structurally sound not hypertrophied, but merely enlarged The power of the heart to dilate is one of its compensating mechanisms, but the larger the heart when the dilatation begins, the less the relief and the less complete the subsidence afterward The dilatation occurs just as it occurs with excessive athletic strain, but when the overexertion is frequently repeated, the heart does not get a chance to recuperate between It is not the severity of the exertion which determines the amount of strain but the previous condition of the heart, whether it has been weakened by preceding infectious disease or has not yet reached its full development or has been given improper physical training Some factor of this kind was evident in the eighty-five men with persistent dilatation which has not subsided during the two or three years they have been under observation but in only fifteen did the condition progress to actual insufficiency of the myocardium In examining 400 young men just called to the colors, Kaufmann found dilatation of the heart in 25 per cent after brief military training He adds that there are conditions in the pituitary has not been positively established to date Even with loss of the diuresis regulating property of the pituitary secretion normal compensating processes in the kidneys may ward off diabetes insipidus

Bence-Jones Proteinuria with Leukemia—Decastello reports here his third and fourth case of this combination The Bence-Jones body he says seems to originate in pathologic conditions in the bone marrow and hence it is not influenced by peripheral raying But administration of benzol might reach it in the bone marrow and he suggests that this should be associated with roentgen-ray treatment He cites four similar cases from the literature lymphatic or myeloid leukemia with the Bence-Jones proteinuria all in men The leukemia did not differ otherwise from the usual clinical picture nor the necropsy findings in two of the cases In a case of metastatic cancer in the bone marrow tests for this protein were repeatedly negative In three of his cases roentgen-ray treatment alone materially improved the blood count and general health but the proteinuria was left unmodified

The Urochromogen Fraction of the Urine—Weiss uses ammonium sulphate for enrichment of the substance in the urine giving the urochromogen reaction as he describes

Extrasystoles—Singer and Winterberg analyze a case in which the interference of two rhythms was plainly evident a normal sinus rhythm and an automatic ventricle rhythm interfering and causing the extrasystoles

Cholesterin in the Blood—Richter Quittner reports research which has apparently demonstrated that in normal condition the total cholesterin is divided about equally between the blood corpuscles and the plasma but the free cholesterin is exclusively in the corpuscles and the cholesterin ester exclusively in the plasma In pathologic conditions, cholesterin is found in abundance in the plasma along with a little cholesterin ester

or veins in the pia, and in one of these cases there was associated actual pertussis meningitis

Intake of Fluid and Composition of the Blood—Wimberger writes from Pirquet's clinic at Vienna to describe extensive series of tests on seven children from 7 months to 15 years old in which the refractometric findings and the daily variations in weight over long periods were compared with the intake of fluids They demonstrate anew that the concentration of the blood serum keeps at a very constant figure, irrespective of wide variations in the intake of fluids The solid tissues of the body take charge of the excess of fluids, the composition of the blood seeming to be independent of the water content of the body

Thrush—Steinert discusses the clinical picture of thrush and the biology of the fungus responsible for it His attempts to transmit the aphthae all failed When there was associated digestive disturbance, rinsing out the infant's stomach with an alkaline mineral water restored apparently normal conditions in both stomach and mouth without local measures Otherwise, he touched the aphthae with a 1 per cent solution of silver nitrate or gave the child a boric acid teat to suck This latter is particularly useful with diffuse thrush when the child sucks vigorously on it, as the mechanical effect helps

Age and Constitution in Respect to Infections—Huebner has compiled the history of the infectious processes of 190 infants less than a year old The younger the child the less the tendency to contract infections, but the severer the course when once installed

Convalescents' Serum in Prophylaxis of Measles—Degkwitz relates that at the Munich children's clinic about 183 children with measles are admitted annually, and the average death rate is 28 8 per cent for those under 2½ and 4 8 per cent for those above this He injected from 7 to 22 c c of convalescents' serum in young children when another child in family or ward had developed measles, and none of the injected children showed any signs of measles although continuing to sleep, etc, with the measles child, while many of the uninjected children developed the disease The blood for the purpose was drawn from a vein in the arm from seven to ten days after defervescence, a total of 40 c c, which yielded 16 or 18 c c of serum To this a drop of a 5 per cent solution of phenol was added, and the whole kept in a fused ampule in the cellar He queries whether the serum of normal adults most of whom have passed through measles might not have the same protecting potency, but larger doses would probably be required He intends to experiment in this line with the parents' serum both in prophylaxis and in treatment of developed measles, in the hope to ward off pneumonia He regards the results accomplished as very encouraging both for measles and as a hint for scarlet fever

*Tuberculin Inunction Treatment of Tuberculosis E Effler—p 11
*Contraindication for Artificial Pneumothorax E Rautenberg—p 13
*Iodin Treatment of Lupus K Moncorps and M Monheim—p 23

Tuberculin Inunction Treatment of Tuberculosis—Effler refers to Petruschky's inunction treatment of the tuberculous inhabitants of the peninsula of Hela, near Danzig with which he claimed to have practically stamped out the disease, as was mentioned in THE JOURNAL at the time, March 20, 1915 p 1038 Effler presents evidence that Petruschky s statements were too optimistic, ten cases are known to have developed since with four deaths, among the 300 inhabitants

Contraindication for Artificial Pneumothorax—Rautenberg induced the pneumothorax to arrest recurring hemoptysis in two men Both happened to be just 50, and in both the pneumothorax answered its purpose arresting the tendency to hemoptysis but both men soon displayed difficulty in breathing and the heart action grew progressively weaker with death the twelfth and fourteenth day The chest of each of the men was of a pronounced barrel shape, with rigid walls and a tendency to emphysema of the lungs This combination should warn against inducing pneumothorax.

Iodin Treatment of Lupus—Moncorps and Monheim refer to Bessunger's method of massaging a solution of iodin into the skin and then exposing the region to the roentgen rays The raying liberates nascent iodin, and this induces an inflammatory reaction with ulceration As this heals, the lupus disappears They report thirty-five lupus patients thus treated during the last year, saying that the results to date in two thirds of the cases rank with those of the best with other methods

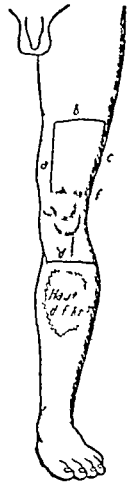
Operation for Cryptorchism G Lo heissen—p 442
*Cryptorchism and Its Mode of Development K Hofmann—p 443
*Bent Over Flaps in Plastic Operations M Kappis—p 445
Primary Focus with Deep Subpectoral Phlegmons U Hammer—p 448

Cryptorchism and Its Mode of Development—Hofmann has operated recently in seventeen cases of cryptorchism According to his anatomic findings, cryptorchism is attributable to arrested development or a malformation of the canal of Nuck There is no malformation of the testis or the spermatic cord their growth has only been prevented by mechanical causes Normal descent of the testes is possible only when there is normal development of the canal of Nuck. Imperfect development of this canal must necessarily lead to cryptorchism His method of radical operation follows as a matter of course from this conception of the anatomic relations

Bent-Over Flaps in Plastic Operations—Carrying out the suggestions of Neuhauser Kappis has been using twice turned-over flaps in plastic surgery In view of the simplicity and effectiveness of the method he thinks it deserves to be more generally applied In the first sitting a skin flap following the lines *a b* and *c* is dissected and turned over at the line *c f* with the raw surface uppermost Margin *b* of the flap is then sutured in a linear incision *d* which is made just above the defect The proximal margin of the incision *d* is sutured to the margin *b* of the bent-over flap, and the distal margin of the incision is sutured to the raw surface of the flap in such a manner that a wide raw strip of the flap is in contact with and grows to the incisional wound *d* The defect *a b c* is reduced to as small a size as possible and the balance is covered with Thiersch flaps. The pedicle of the flap, at *c f* is cut through gradually at several sittings The defect to be covered is carefully prepared to receive the flap, which is kept on the stretch so as not to shrink. The angle at *d* should gradually be made to approach 90 degrees (which may be accomplished by padding beneath with cotton), so that when the flap is turned over the second time it will not break away from the pedicle In the final sitting the flap is entirely severed at the line *e f* the defect and the margin of the flap are freshened and the flap is sutured over the defect Some of the advantages of this plastic operation are that the sound leg is left free and intact, and the whole operation is a matter of leisurely convenience The pedicle *c f* need not be separated from its blood supply until circulation has been definitely established in the new pedicle at *d* Very narrow bridges will often suffice to keep up the nutrition of the flap The success of the operation is assured provided the flap *a b c* does not necrose which with care working under such favorable conditions, we can usually prevent



a b c outline of flap *d* incision to receive upper margin of flap *Hautdefekt* ulcerated surface to be covered with flap

THE FUTURE OF THE PHYSICIAN*

FREDERICK PETERSON, M.D.
NEW YORK

Must we not provide good physicians for the state, and must not these be such as have been conversant with great numbers both of healthy and sick people?—*Plato's Republic*

Psychology teaches us that the essential function of the mind is its dealing with the future. Life is one long anticipation, preparation for what is to come, preoccupation with tomorrow. Of course, there could be no outlook without experience. The faculty of anticipation is based on the store of memories as the searchlight depends on electromotive force or the cantilever bridge reaches out ahead in direct proportion to the materials gathered and joined together behind, so the subject of this particular anticipation of the future of the physician is based on an experience of forty years in the practice of medicine. If the cantilever bridge is a good analogy, I ought to be able to project my anticipations forward, then, at least some forty years.

Most physicians of this generation and of all previous generations have busied themselves with diagnosis and therapy, and, of course, among the oldest generations of physicians therapy was the chief study and occupation, because knowledge of the changes in the body produced by disease and of accurate methods of diagnosis are all very recent in the history of medicine. They did not really know very much even about therapeutics in the old days, but they could and did prescribe. Theirs were not exactly shotgun prescriptions—they were more like shrapnel. A famous and favorite prescription for many centuries was the theriaca of Andromachus. It has attained immortality, together with its prescribers and its victims. Andromachus of Crete invented it. Nero promulgated it by order. I will not take time to name its sixty-one components—but in later centuries it was improved in the Codex of the Faculty of Medicine of Paris by the addition of eleven more ingredients—one of these the flesh of the viper—so that in the end the Favorite Prescription was compounded of seventy-two assorted medicaments.

I'm not so sure that we should laugh at this prescription. We might smile a little, with diffidence, with an eye on the future, for our posterity will probably find much to amuse them in our own therapeutic inventions, methods and agents. I wonder what they will say of some of our surgical procedures, our endocrine adventures, our psychanalysis, eye-muscle cutting, removal of submerged tonsils and turbinated bones, teeth-pulling—these therapeutic epidemics among physicians of our day?

No, we must not be amused at the past. We must rather remember that out of all the facts, errors, follies, mistakes, theories, absurdities, assertions, denials, experiments, failures, of these thousands of years our Tree of Knowledge has risen. These were the gropings of a myriad rootlets in the dark for food and drink and strength of hold. Out of this soil our Ygdrasil has grown.

Therapeutics is the oldest department of medicine. I have no doubt there were practitioners of therapy among the Aurignacians 25,000 years ago. It is indeed, an ancient and venerable art. It is also the chief interest of the patient today. He does not go to the physician for diagnosis especially, but for relief, for cure, and his demands are in the words of the old Latin therapeutic formula "Curare cito, tuto et jucunde" to cure quickly, safely and pleasantly. So therapy has had to be thus far the main practical occupation of the physician. To rationalize and improve his therapy he has studied disease, the alterations in the tissue made by disease, the symptoms of the disease, the causes so far as they could be learned, and the infinity of means and methods of diagnosis. And all this material has become so complicated and vast that the medical student of today must needs be an "invincible athlete" to compass it.

Take, for instance, this little fragment of what is required of a medical student today in one of our leading American colleges. It is a syllabus which I find reproduced in Sir James Mackenzie's book on "The Future of Medicine," a book, by the way, which should be read thoughtfully and carefully by every student and physician, and to which I shall refer again later. This is a prospectus of what a student should acquire during his first year of clinical work in the way of technic in special and instrumental methods of examination. It is too long to quote, but I have been strongly tempted to shorten it, to dramatize or put it in the form of vers libre, to make a sort of Whitmanesque poem of it, and it is reproduced herewith. It would have pleased Walt Whitman.

Sir James Mackenzie thus comments on this syllabus:

These are the subjects recommended in one school for the student's study during three half-day exercises per week for six months. When it is understood that even the specialists who employ these methods have only an imperfect knowledge of the meaning of the signs which their methods bring to light, the practical benefit to the student can be inferred. I need not dwell on the state of the student's mind at the end of a six months' course of this kind of instruction, especially when this subject is probably but one of several others pursued in the same spirit.

---

*Read before the Alpha Omega Alpha Fraternity, Syracuse, N. Y., April 13, 1920.

Sir James is concerned with the effects on the *student* of this wandering in a maze of technic and mechanical systems

My own query is, what does the *patient* get out of it—the patient who comes to the practitioner for help and relief from suffering? Would the patient who ran the gantlet of all this formidable array of diagnostic mechanisms (and survived the diagnosis) be in the end really any better off, or as well off, as if he trusted himself to some good old-fashioned sensible country doctor?

I met a patient who had had most of these tests tried on him, and he said the experience was most impressive I asked him what the doctor had done for him as a result of these labors He said "He gave me rhubarb and soda, and when I told him that was just what my doctor in Skaneateles had given me long ago, he said it was not rationalized not scientific Then I said rationalized rhubard was having a wonderful cathartic effect on my pocket book"

There is no doubt that ultimate good will result from all this effort at scientific precision It is the road of progress But this work is still mostly for the seekers after truth, the research men of our institutes and laboratories, and the medical student and practitioner should not be so overwhelmed with mechanics and half truths that they lose the power of close clinical observation, the power of giving every possible relief to the sick people out in the world who are their care

FOUR STAGES OF DISEASE

Now to turn again to Sir James' book, I want to call attention briefly to the most important thesis there set forth

In the first place, he points out that disease may be said to progress through four stages

A predisposing stage in which the individual is still free from disease but inherently weak or vulnerable

The early or curable stage, when the disease has not produced any perceptible alteration of tissue and the symptoms are mainly subjective

The advanced stage when the disease has progressed so far as to cause destruction or modification of tissue and when its presence is revealed by physical signs

The final stage when the patient dies and the tissues are subjected to a postmortem examination

We have a vast accumulation of knowledge concerning the third and fourth stages of disease, i e, of the pathologic tissue changes found at necropsy and of the coordination of such findings with the clinical manifestations of the third advanced stage with its active structural changes Now the chief aim in the practice of medicine, to cure the patient, has been almost forgotten in our intense devotion to the pathologic changes in tissues and to methods of diagnosis of disease in its advanced stage when usually irremediable damage to the tissues has already been done

He points out that we have magnificently equipped institutions for the study of disease after the patient has died, and great hospitals for patients suffering from the advanced stages of disease presided over by staffs of skilled, trained and experienced physicians, but few or no attempts are made to train men to detect disease when there is hope of cure

His plea is that we should now study and understand the first and second stages that there are signs and symptoms which we shall some day be able to discover, obscure and indefinite though they may seem to us now, that we should devote ourselves to observation of the predisposing and early or curable stages of disease

It is evident that patients in these early stages do not come under the observation of laboratory or hospital physicians, but, if vaguely uneasy about themselves go to the family physician for advice It is therefore in the hands of the general practitioner to make this new and highly important study of the earliest symptoms These earliest symptoms are mainly subjective, and it is for general practitioners everywhere to intensify their clinical observations of these cases just passing over the borderline between well-being and disease

This to me is the main thesis of this book, and the idea is developed with much suggestive detail

I believe that our immediate opportunity lies in a general, widespread, careful and exhaustive examination of the earliest signs and symptoms This entails a new significance to the study of subjective manifestations, and the development of new means and methods

Before passing to another part of my subject I want to make my position clear in regard to all these modern mechanical innovations in the practice of medicine What I oppose is their too ready acceptance and

PROSPECTUS FOR A FIRST YEAR OF CLINICAL MEDICINE

(After Walt Whitman)

O Neophyte in medicine
In thy first year
Acquire roentgenoscopy,
And roentgenography
And be fascinated
By the simplicity of teleroentgenography
As applied to head thorax abdomen
And all the bones and members
In the clinical laboratory
Learn microscopy and chemistry
In the bacteriological laboratory
Learn to collect materials
Diagnosticate by lens and culture
By inoculation of animals
By virulence tests
Seize the doctrines of immunology
And study agglutinins bacteriolysins
Hemolysins precipitins opsonins and ergins
mphasize Widal and Wassermann
chick and tuberculin
ext absorb rhinoscopy
haryngoscopy laryngoscopy
ranasal transillumination
emonstrate the bronchoscope
And puncture the pleura
Learn speedily sphygmography
Cardiography phonocardiography
Electrocardiography tonometry
And sphygmomanometry
And upon these superimpose

Clinical angiological methodology
Do not neglect odontology
Paradental infection
Pyorrhea alveolaris
The cognoscibility
Of roentgenograms
Of dental films
And if possible oesophagoscopy
Fail not to practice gastric intubation
With test and con rast meals
And contrast enemas
With proper serial survey
By roentgenography
It takes but little time
To know the pancreas
By service of the duodenal pump
And secretory analyses
Whence we proceed to proctoscopy
And rectosigmoidoscopy
And urogenital methodology
With urethroscopy cystoscopy
Ureteral catheterization
And pyelography
Grow competent in neurology
By accurate tests cutaneous
Deep gustatory olfactory
Acoustic vestibular visual
Motor reflex coordinative
Tests of the speech and writing
Sphincters and trophic functions
Adding to this anthropometry

Lumbar puncture electrodiagnosis,
And nervous architectonics
Pay attention to con ciousness
Of the patient as a whole
Not forgetting attention
Perception identification,
Diction feelings moods
Emotions and conative functions
Judged by behavior and conduct.
Then learn how indispensable
For diagnosis and therapy
Are studies of metabolism
Seize the doctrine of balances
Make preliminary tests
Of assimilation digestion absorption
Then determine the metabolism
Of proteins nucleins purins
Carbohydrates fats water
Mineral substances and vitamins
And learn direct and indirect calorimetry
These are only preliminary to the study
Of several amino acid diatheses
Of diabetes mellitus and gout
Thus prepared O Neophyte finally approach
The endocrine glands
By pharmacodynamics
Tests with epinephrin atropin pilocarpin
Till endocrinopathies are laid bare
These simple points are but an item
For first year students who recite em
Next year add more—ad infinitum!

adoption by practitioners all over the land before their real value has been thoroughly and finally demonstrated No one can gainsay the importance of the pursuit of these methods by experts in research laboratories and hospitals, but their exploitation in private practice before their real value or the significance of their findings has been conclusively ascertained is harmful to the profession and, incidentally, sometimes to the patient

For example, a patient rushed into my office not long ago with an armful of electrocardiograms They had cost him $300, and he was frightened to death They were exquisitely done and beautifully mounted, and there were enough of them for a frieze in a refectory He had a simple neurasthenia with the palpitations so common in that disorder There was no heart disease, and the pictures were formidable, unnecessary and expensive It took some little time to cure him of a cardiac hypochondriasis But it is not alone such elaborate machinery as this that is liable to misinterpretation by both physician and patient, even so simple and widely used an instrument as blood pressure apparatus has, I fear, proved misleading to many physicians and a source of much alarm and hypochondriasis to innumerable patients—not perhaps in the hands of experts, but in the hands of their less experienced imitators all over the country

HEALTH INSTRUCTION IN PUBLIC SCHOOLS

Now let me invite your attention to a still more important and fruitful field in the future work of the physician The quotation from Plato at the beginning of this paper suggests that the physicians provided by the republic should be such as have been conversant with great numbers both of healthy and sick people It is the healthy people whom we are now called on to consider We physicians have been so busy studying the seats and causes of disease, diagnosis, pathology and therapeutics that we have almost forgotten the healthy people Yet it seems to me that the physician of the future must make health and healthy citizens his chief concern There are two factors which have militated against our heretofore taking health into consideration First we have been and are too busy with relief repairs and consolation among our clientele to pay much attention to the healthy people about us Second, the healthy people, engrossed in their own objective affairs, slap themselves on the chest, and feel that the world is their oyster and that they can afford to laugh at fate and the doctors There are two serious but not insurmountable conditions I believe that the healthy people and the physicians can be brought together for a common purpose, namely, the reconstruction of the race

The span of life in this country is about sixty years and for a century or so we have had in our minds the extension of this average life span beyond the sixty years But these sixty years are not sixty health years, just sixty years of living, full of more or less ill health and physical decrepitude The "health span" of life, as Dr Eugene Fisk calls it, is a much more important matter than the length of life That "health span" is just about ten years When the robust, healthy citizens referred to learn the fact that no matter how long they live they are certain of only ten years of exuberant well-being, they are going to stop a moment in the rush of things and take thought They are going to insist on physicians lengthening that health span and as soon as the physicians also learn this fact, which few now know, they too will turn their attention to the healthy people and do their part to extend the health span of the race The ailments that impair health are mostly minor and remediable forerunners, perhaps but not the serious disorders from which people die

I hate to recite statistics but I must refer to the oft-quoted rejection of more than one third of the flower of our race between the ages of 21 and 31 in the army draft—nearly a million unfit for service—and among those accepted several hundred thousands in the camps found to have "physical defects ranging from syphilis and gonorrhea to flat-foot"

The British taking in the men of 40 years, rejected 69 per cent as unfit for military service

More than 16 000 000 children of our 22 000 000 now in the public schools have physical defects most of them preventable and remediable such as heart and lung diseases disorders of sight and hearing, diseased adenoids and tonsils, flat feet, weak spines imperfect teeth and malnutrition and among them 1 per cent of mental defect I mention these facts first to show how much work there is to be done by physicians among the supposedly healthy members of any community, and secondly to point out the most promising way in which the problem of health may be made evident to the whole people

We all know how disappointing and almost futile have been our efforts to rouse the people in the matter of public health—the millions expended our health exhibits our health lectures, our clean-up campaigns our pamphleteering—all these expenditures of money and energy have merely scratched the surface The foremost public health worker in America told me one day that our tuberculosis campaigns in certain states have accomplished practically nothing and that in one state where nothing whatever had been done there was as much improvement in tuberculosis statistics as in states where campaigners had done their best work

The point is that we cannot by these methods make clear the matter of public health to the conservative reactionary, more or less fossilized minds of the grown-ups We must reach the whole people in the matter of health through the plastic, receptive minds of the children in the schools

We need but ten minutes daily of health instruction in our schools It should be a thorough system of instruction in all matters pertaining to health with special emphasis on health problems rather than on disease in physical and mental habits in personal hygiene, in public health and sanitation in methods to avoid communicable diseases in the responsibilities of parenthood and in all that relates to nutrition and growth, including foods and food values and food habits

These facts reach the growing child become a part of him and affect his whole attitude toward life Moreover he takes them home and applies them to his younger brothers and sisters the children of preschool age and best of all he teaches his parents these facts and their importance and parents will take and absorb ideas from their children to which otherwise presented they would be impervious

The physician of the future is to be a Master of Public Health He will push and help instruction in health in the public schools He [illegible] ople will flock to him He will fortify [illegible] the

onslaught of disease He will recognize the earliest subjective signs of inroads of disorder and learn to defend his patients from its further encroachment His mission will be to lengthen the health span of life

A FIVE OR SIX YEAR COURSE IN MEDICINE

JOHN A KOLMER M D
PHILADELPHIA

It is generally recognized that the curriculum of the present four year course in medicine is so crowded that expansion of certain courses, to facilitate more thorough instruction and the inclusion of recent advances in the medical sciences, is almost impossible A saving of time could possibly be gained by more coordinated teaching to avoid repetition of instruction in the same subject or subjects in different departments, but even under these conditions it is exceedingly difficult to introduce new subjects to meet the ever increasing demands of a liberal education in modern medicine

For example, the medical student of today should receive more practical instruction in biologic chemistry, immunology and advanced bacteriology, medical zoology, medical drawing, preventive medicine and medical sociology, than afforded by the majority of medical schools at present, also, more recitations conducted by the professors for the purpose of review and coordination, more time and opportunity for conducting laboratory work in connection with the clinical branches and for clinicopathologic conferences, and increased opportunities for elective study and original research in the last year of the course

The majority of medical schools in this country now require that the student of medicine shall have completed a standard four year high school course of study, or its equivalent, plus two years of work in an approved college of arts and science including courses in French or German and in English, physics, chemistry and general biology or zoology, with appropriate laboratory work Some of these schools contemplate raising these requirements to include four years of collegiate work and a bachelor's degree in arts or science

Instead of demanding these two extra years of college work, I believe that medical education will be better served by keeping the entrance requirements at the present minimum and extending the course in medicine one year, or two years if the medical school can guarantee a hospital internship for its students so that the degree in medicine is conferred after the successful completion of at least one year's residence in an approved hospital

If a collegiate degree is demanded for admission to a medical school, the student spends eight years in college after graduation from high school before he or she is prepared for the practice of medicine, and nine years, if one year of hospital residentship is taken, with the foregoing plan the whole time required, including a year's hospital internship, is eight years Furthermore, the student devotes the extra year or two to study in a medical atmosphere, and I believe that the better opportunities afforded for the teaching of the medical sciences will give the student as good an opportunity for developing mental capacity and cultivation as is afforded by the third and fourth years in a college of arts and science For example, a reading knowledge of French or German is usually required for admission, with an extension of the medical course, time is permitted for the teaching of what may be called "medical French or German" during the first and second years, requiring the students to develop sufficiently in these languages to read medicine in one or both with fair success, which is far from being true of the average student under present conditions

By reason of the added facilities for teaching the medical sciences, I believe that all students successfully finishing the first two years' course in medicine should receive the degree Bachelor of Science or Bachelor of Medical Science (B Med Sc), the degree of Doctor of Medicine should be conferred after the successful completion of the entire course of five or six years

A FIVE YEAR CURRICULUM

As previously stated, the added year will permit the extension of certain courses and the inclusion of others, a curriculum as follows could be worked out by the majority of schools, a year embracing thirty-two weeks of from thirty-eight to forty hours a week, and divided into semesters or trimesters as necessary

FIRST YEAR

Anatomy including histology, embryology osteology, syndesmology, topographic anatomy and neuro-anatomy
Physiology
Toxicology
Medical drawing
Illustrated lectures in the history of medicine.
Study hours with special reference to French and German literature with the aid of instructors

SECOND YEAR

Pharmacology, including materia medica and pharmacy
Physiologic and biologic chemistry
General pathology
General bacteriology and medical zoology
Hygiene and preventive medicine
Medical drawing
Study hours with special reference to collateral reading in German and French with the aid of instructors

THIRD YEAR

Special bacteriology and immunology
Special pathology (neurosurgical-gynecologic pathology) and clinicopathologic conferences
Clinical pathology and microscopy
Applied anatomy
Physical diagnosis
Medicine including practical and applied therapeutics and dietetics, medical sociology
Surgery
Obstetrics
Roentgenology and electrotherapeutics

FOURTH YEAR

Medicine including pediatrics, neurology, medical psychology and mental diseases
Surgery including orthopedic and genito-urinary surgery
Gynecology
Obstetrics
Ophthalmology otology rhinology and laryngology
Dermatology and syphilology
Clinicopathologic conferences
Lectures in medical jurisprudence and medical ethics

FIFTH YEAR

Medicine obligatory with associated laboratory work in bacteriology chemistry immunity and clinical pathology
Surgery obligatory with associated laboratory work on concrete cases

Clinicopathologic conferences obligatory
Electives and research in any of the branches given in the first four years, each student being obliged to select a minimum amount of work

COMMENT

The first four years would give a liberal and comprehensive course in medicine, including instruction in the specialties The added fifth year will afford more time for developing dispensary teaching, including sociological medicine and for more laboratory work in connection with the clinical branches, as so clearly emphasized by Dr Vincent[1] The fifth year, by providing ample opportunity for elective studies, will also enable the student to concentrate on one or more clinical or laboratory branches and engage in original investigations under certain conditions to better advantage than at present, without sacrificing the principal aim of the medical school to give a broad and comprehensive course of instruction before the student is permitted to begin specialization

I do not wish to convey the impression of being opposed to a complete collegiate education preliminary to entering on the study of medicine, indeed, this is far from being the case But the time has come when schools must seriously consider the extension of the course in medicine, and to do this without greatly increasing the expense and time required, I believe it is better to keep the entrance requirements as they are at present in Class A schools, extend the course in medicine for at least one year and reward the extra time devoted to the study of medicine with the degree Bachelor of Medical Science at the completion of the first two years' course, and the degree Doctor of Medicine, after the completion of the last three years If the medical school is so situated that the graduate can be guaranteed a year's residentship in an approved hospital, preferably with a mixed or rotating service, this extra and valuable year may be demanded for the degree of Doctor of Medicine, although I do not believe that the majority of schools are in position to adopt this requirement at the present time

TEACHING THE PATHOLOGY OF FUNCTION

HOWARD T KARSNER, M D
CLEVELAND

If the position of pathology in the medical curriculum today were to be described diagrammatically, it might be stated that it occupies the neck of an hour-glass The students receive in the earlier years their conception of fundamental sciences, and as the sand concentrates toward the neck of the hour-glass so are the methods of these fundamental sciences concentrated in the study of pathology, the student later branching out in the clinical divisions to apply to the diagnosis of disease the methods and conceptions acquired in his preceding work In further elaboration it may be stated that the student learns in his first and second years of study the special methods of anatomy, histology, biochemistry and physiology He is then prepared to enter on the study of those changes from the normal which constitute the natural history of disease

Gay[1] has concisely said that "'pathology' is still used to mean morbid anatomy rather than the natural history of disease" Fortunately for medicine however, this conception is gradually being discarded and the term more broadly applied to the alterations of form and of function which go to produce the manifestations of disease Henderson[2] has stated that "a man trained by necropsy and microscope is inevitably a morphologist" Medicine does not suffer from having morphologists among her devotees unless those morphologists are devoid of a sense of proportion and possessed of minds incapable of appreciating the phenomena of function

I wish to express the profound conviction that just as the science of medicine depends on a comprehensive understanding of anatomy in order properly to interpret function, so does the pathology of function find its basis in pathology of form This is not to be interpreted as an indication that alteration of function and alteration of form are parallel, an idea readily controverted in almost any clinical pathologic conference To teach pathology without a systematic course of instruction in pathologic morphology would be as absurd as attempting to teach medicine without the study of anatomy It may very well be that the fields of investigation in pathologic anatomy are not at the present time of such great promise of early and fruitful results as the fields of pathologic function, but this does not by any means excuse the teacher of pathology from omitting morphology as the basis in teaching work

Recognizing the broad scope of pathology as it was conceived by Virchow, we come to a realization of the fact that in the same sense as anatomy is not the science of medicine, so is pathologic anatomy not the science of pathology In agreement with Opbuls[3] I must emphasize that "a thorough understanding of the biologic processes of health and disease cannot be reached by one method alone" In order to convey to students of medicine the proper conception of pathology, we must recognize that pathology in itself is not a science in the same sense that medicine itself is not a science Pathology constitutes a melange of scientific methods, and adopts for its own purposes not only the methods of the premedical sciences but those of the more fundamental pure sciences as well Pathology, without physics and without mathematics is on an extremely insecure basis Few there are who take exception to this point of view as regards investigation in pathology but many still hold to the view that teaching this subject should be confined to morphologic methods The latter fail to recognize that the student of today is the investigator of tomorrow, whether he directs his attention to the practice of medicine or to a life devoted to investigation of disease from a more fundamental point of view The so-called seclusion of the laboratory often leads one to forget that the living patient as he appears for diagnosis represents a problem in investigation

The pathology of Rokitansky was pathologic anatomy but inspired by the stimulus of Virchow and particularly that of Colnheim, pathology took over the method of physiology and chemistry With the epochal work of Pasteur, pathology adopted the

3 Opbul William Anatomic Structure and Function J A M A 63 521 (Aug 15) 1914

methods of bacteriology, parasitology and immunology As time has gone on, a certain amount of specialization in these various fields has become apparent, but this fact does not exclude the teacher of pathology from being familiar with at least the fundamentals of these methods of examining disease The pathologist who ignores any of these methods is remiss in his duties to his students and his school

If, in the curriculums of most of our medical schools, pathologic anatomy and histology and also bacteriology are given very definite places and allotments of time, there has been, nevertheless, a regrettable neglect of pathologic physiology and chemistry, as well as immunology, in the required work of the student The widespread application of physiology and chemistry in internal medicine, the important utilization of immunologic methods in the diagnosis and treatment of disease, make it essential that the properly trained student must have had work in these divisions as a required part of his training in medicine The student who graduates without training in at least the fundamentals of these subjects is not sufficiently equipped to practice his profession Leaving to chance the possibility that these topics will be touched on in the courses of medicine and surgery is an injustice to students and to the institution Providing for instruction simply by permitting students to take electives in these subjects is almost equally unjust The curriculum that places in a group of electives subjects of fundamental importance is neither well balanced nor properly conceived That this principle will not be conceded by thoughtful teachers seems unbelievable This being granted, there remain the problems of time and place There is no lack of agreement that the medical curriculum at present is overcrowded, but this fact cannot be accepted as an excuse for omitting from the course of study those fundamentals that are necessary I am in agreement with those who believe that in order to accommodate the necessary subjects, the curriculum must make room at both ends of the present four-year course of study This means that the colleges must accept some of the burden of premedical work which is now included in the four-year course, and also necessitates adoption of a fifth year into which may be placed some of the clinical work included in the third and fourth years of the medical course The growth of medical science necessitates procedures of this sort In this way lies success of medical education, in any other way lies failure

The place in which pathology of function is to be taught cannot be single, it must be multiple If the preclinical subjects are to be taught as a part of technical education in medicine rather than as abstract science, it is necessary that there shall be brought to the attention of the students certain variations from the normal which constitute part of the process of disease The clinic concerns itself largely with manifestations of disease, or, in other words, with pathologic physiology in the broadest sense, from which are interpreted not only the outlines of treatment but also the diagnosis of disease The disease is manifested in a group of functional disturbances which may or may not be dependent on demonstrable morbid anatomic alteration of an organ or group of organs The question then arises as to how far one is justified in taking into the course in pathology a consideration of the alterations that accompany the changes of form There is little doubt that the pathology of the dead, so far as it concerns the great bulk of medical students, is a study of death and not of life The ideal of teachers of pathology is to make the subject an exposition of the causes, processes and results of disease Therefore any method that brings clearly to the mind of the student the fact that he is studying, in pathologic anatomy, only the end-results of disease is of the utmost pedagogic importance That these methods include only those of experiments on animals is entirely erroneous, for a proper correlation with clinical branches makes it possible for the clinician and pathologist to cooperate at least in certain exercises, so as to emphasize the fact that the lesion studied is similar to that found in the living patient

The teacher who can attain this ideal can well afford to sacrifice some details of pathologic anatomy or pathologic histology, for his larger object is to aid in the training of physicians, and not simply the production of students with a facile, though evanescent, knowledge of pathologic morphology The advantage of including studies of function in the course in pathology is twofold, in that such a procedure makes the subject a living subject and at the same time is of great value in the development of a well-trained graduate I am by no means insistent that the course in pathology should include the list of experiments published by my distinguished teacher, R M Pearce,[4] in spite of the fact that I am firmly convinced that all these experiments have an important bearing on the subject The student learns more by doing than by seeing others do and, accordingly, it would seem more desirable to have a large number of students do a small number of experiments in which all can partake, than to have a small number of students do a large number of experiments and demonstrate to the remaining members of the class It must be conceded, however, that there is an irreducible minimum of essential experimental procedures, and the individual teacher must accommodate his facilities and training to the number of students in his classes If, however, the student is limited to observation on animals he is likely to lose sight of the application to human medicine, in spite of the most earnest direction of his teachers Therefore a certain amount of clinical correlation[5] should be attempted As an example, one might say that listening to a heart murmur produced artificially in a dog would have relatively little significance unless the student is able also to listen to a murmur in a living patient Correspondingly, the study of alteration of secretory effectiveness of the kidney in an artificially produced nephritis is of little value unless the student can be shown the same sort of test as applied to human cases of nephritis

As concerns general pathology, more particularly the phenomena of inflammation, the mere fact that bacterial infection may produce certain types of inflammation is insufficient unless there is correlated with this the development of immune processes I shall not discuss in extenso the position of immunology in the medical curriculum, that is whether it should be taught in the division of pathology or in the division of bacteriology That it should be a part of the medical curriculum as a required subject is

4 Pearce R M The Teaching of Experimental Pathology and Pathological Physiology to Large Classes Bull Johns Hopkins Hosp 22 249 1911 Karsner H T The Function of the Experimental Method in the Course in Pathology Boston M & S J 167 511 1912

5 Karsner H T The Experimental Method as Utilized in the Clinico Pathological Conference Boston M & S J 170 723 1914

indicated by action taken on the part of certain of our medical schools in the recent past Furthermore, the study of inflammation and infectious disease as a part of general pathology is fruitless unless the immunologic phases are considered and at all times supported by experimental study

The institution of special departments of experimental medicine or of research medicine does not in any way absolve the teacher of pathology from pedagogic methods of the broadest scope or from bringing to the attention of his students, from the experimental point of view and from the clinical aspects, the living nature of his subject

CONCLUSION

Let me express again the firm conviction that pathologic morphology is the fundamental basis of this subject from the teacher's and investigator's point of view, but that this method alone is not sufficient to meet the demands of modern medical education and investigation Time for the study of pathology of function in the course in pathology should be found, even if it involves some sacrifice of detail in the study of morphology The place for teaching pathology of function is in every department of the medical school It may be emphasized in one department or another as local conditions necessitate, but if it be omitted in any department, that department is not fulfilling its proper duties toward the training of students, the advancement of medical education, and the forwarding of the investigation of disease

---

A PLAN FOR A GRADUATE COURSE IN PEDIATRICS FOR GENERAL PRACTITIONERS

JOHN LOVETT MORSE, A M M D
Professor of Pediatrics Medical School of Harvard University
BOSTON

The department of pediatrics which offers instruction to graduates should be prepared to give courses of five different types in order to meet the needs of various classes of students These five types should be planned as follows

1 For general practitioners who wish to improve their general knowledge of pediatrics and to become acquainted with the recent advances in the subject

2 For general practitioners or recent graduates who wish to become specialists in pediatrics but not teachers or investigators

3 For those who wish to become teachers and investigators as well as specialists in pediatrics

4 For general practitioners living in the vicinity who wish to familiarize themselves with pediatrics

5 For specialists in pediatrics who wish to undertake special investigations

I shall consider, however, only the first type of course, that intended for general practitioners who wish to improve their knowledge of pediatrics and familiarize themselves with the recent advances in the subject Such a course should be continuous throughout the year and so arranged that physicians can enter it or leave it at any time In this way only can it properly meet the needs of general practitioners, who are not always able to leave their work at a definite time and remain away for a fixed period, as is necessary if a course is given only during a part of the year and is of fixed duration It is of great advantage to them to be able to begin their work the day that they arrive and to continue it up to the time that they have to leave They should, however, be made to understand that it is far wiser for them to take the course for at least a month and better for three months The course should occupy the whole of every day and should be so arranged that it may be taken for a part of the day only or all day for part of the days, if desired Such an arrangement allows physicians to divide their time between pediatrics and some other subject or subjects, if they wish It may be argued that a physician who takes the course for only a week or two, or for half a day for a few weeks, will not learn much about pediatrics This is unquestionably true, but if he attends but one exercise and learns but one new point at that exercise, he is better off than he would be if he had not taken that one exercise For my part I can see no reason why we should not try to teach a man a little, simply because we do not have an opportunity to teach him much

TABLE 1—ARRANGEMENT FOR A COURSE OF LECTURES

1 Diphtheria	20 Acid intoxication
2 Exanthems	21 Diseases of the blood
3 Exanthems	22 Congenital heart disease
4 Infant feeding—metabolism	23 Acquired heart disease
5 Breast feeding	24 Bronchitis and bronchopneumonia

16 Diseases of the new born	36 Infant mortality
17 Scurvy	37 Infant welfare
18 Rickets	38 Infant welfare
19 Spasmophilia	

The work of a course of this sort must necessarily be largely clinical It should be given partly in the wards of the hospitals and partly in outpatient departments, in order that the physician may see both ambulatory and bed patients, because, if only one type is seen, the range of diseases covered is limited and the instruction is onesided Special attention should be paid in this clinical work to the newer developments in pediatrics about which the general practitioners are not likely to be well informed Special opportunities should also be provided for instruction in the details of physical examination for those who are weak in it This clinical instruction must, of necessity, be rather unsystematic, because it must depend, of course, on the patients who happen to be in the wards or come to the outpatient departments at the given time

It is important, therefore, to have a systematic course of lectures given as a part of the work This course of lectures should be so arranged as to cover all the more important subjects in pediatrics This can be done in three months, if the lectures are given three times a week, in six weeks, if the lectures are given daily Another course should be begun as soon as one is finished, so that the lectures may go on continuously A student can, therefore, if he stays six weeks or three months, as the case may be attend

whole course, no matter when he begins A reasonable arrangement for such a course is given in Table 1

These lectures should not be of the same type as those given to undergraduates It should be taken for granted that the graduates are familiar with the rudiments of the subjects These should be passed over quickly, therefore, and the chief stress laid on details, the newer developments in our knowledge, and new methods of treatment

Most general practitioners are out of practice in laboratory work or are unfamiliar with the newer methods, especially as applied to pediatrics. Provision should, therefore, be made for instruction in the ordinary clinical laboratory methods This should cover at any rate the examination of the blood, urine, stools and cerebrospinal fluid One afternoon a week is sufficient to do this superficially, but two are better Instruction in the technic of more complicated procedures, such as the Wassermann test and the examination of the blood for sugar and nitrogen, can hardly be given in a course of this sort If graduates wish instruction in laboratory methods of this kind, they should get it in some of the other courses

Friday	
3 5 p m	Laboratory Harvard Medical School Building C H Room 393 Drs Grover Hill Percy and Wyman

The physicians taking such a course should also be given an opportunity, as a part of the course, to see something of the workings of a good social service department and of infant welfare clinics or milk stations They should, in addition, not only be encouraged to read, but also told what to read It is advisable to have a list of the best and most recent literature on each subject prepared and placed at the disposal of the students Incidentally, the student should be given a schedule, showing in detail just what the exercises are each day and where they are held, otherwise he is almost certain to go astray The schedule given in Table 2 is illustrative of a month's work in such a course, as given at the Harvard Medical School

It is comparatively easy to plan a course of this sort, it is another matter to make it a success It cannot be a success unless all the instructors are interested and enthusiastic They must be willing to put as much time and energy into it when there are only two or three students as when there are ten times that number They must always have in mind how much they can give to the students, not how much they can get out of it Such a course cannot be a success unless the head of the department and the older instructors do a considerable part of the teaching It will almost certainly be a failure if the teaching is left entirely to the younger members of the department They should, however, be given their share of the work, as in this way they get an opportunity to lecture and do more advanced teaching than they ordinarily do with the undergraduates Finally, if such a course is to be successful, every one in the teaching staff must be prepared to do his best gladly and enthusiastically at every exercise, realizing that the more of himself he puts into his teaching, the more the students will get out of it

HOW THE PEDIATRIC TEACHING OF NUTRITION MAY AFFECT THE NATION'S WELFARE*

HENRY DWIGHT CHAPIN, M D
NEW YORK

In the management of early life, nutrition forms the most important factor, and the building-up process naturally depends on proper food Any serious mistakes made at this time soon show their effects and are difficult of compensation Growth is to be stressed in addition to repair and heat production, and, as the two latter elements need only to be considered in adult life, the child stands in a nutritional class by himself

It is a truism to state that proper nourishment forms the foundation of satisfactory growth and enduring health

The pediatrician is often consulted by the general practitioner in obscure or difficult cases, and he determines what shall be taught mothers concerning nutrition during the period of most active growth, when the physical foundations of the entire population are being laid Therefore, pediatric teaching of nutrition plays an important part in national affairs, although this may not be generally recognized

The importance of this subject has been emphasized by observations during the recent war period The large number of young men rejected by the draft for physical reasons, averaging one in four, at once attracted attention Various investigations have also shown an alarming amount of malnutrition among schoolchildren During 1917 and 1918, the health department of New York estimated that about 20 per cent of the children in the public schools were suffering from malnutrition This condition is not always limited to the poor, but is found to a certain extent among all classes It is thus due to a failure in the proper selection and preparation of food materials, in addition to pov-

* Read before the Section on Diseases of Children at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

erty The question naturally suggests itself as to how much of physical defectiveness and malnutrition is the result of teaching faulty theories of nutrition This subject has at last gotten away from theory and is being based on experiment It is now possible to consider the various theories of infant feeding in the light of knowledge obtained by animal experimentation

The literature of infant feeding during the last twenty-five years has been based principally on divergent theories of pediatric authorities For a long time the steady gain in weight by an infant was considered a demonstration that its food was satisfactory, but many animal experiments have shown that poor growth and rapid gain in weight may go together, and that some individuals who are of satisfactory weight may really be stunted The important thing is to see that gain in weight is the result of real growth and not of simply storing water and fat in the tissues Failure to distinguish between gain in weight and true growth, therefore, may result in poor physical development and malnutrition among children as well as in domestic animals From the standpoint of the infant, insistance on breast feeding, as stressed by Sedgwick and others, will give the best nutritional start If not entirely sufficient, complemental feeding will enable the breast to continue its work The principal mistake has been in neglecting the breast and in holding wrong theories on artificial feeding

A few years ago it was taught that food should be selected according to its chemical composition, as all foods were composed of proteins, fats, carbohydrates mineral matter and water, in varying proportions [1] The suitability of a food thus depended on the quantity of these elements present and artificial feeding consisted in accurately changing and controlling the quantities of these component food substances Much effort and money were expended on chemical analyses of foods and milks But if these efforts were desirable in such direction, they did not go far enough Today it is known that there are many kinds of proteins—the term protein as formerly used having been discontinued, likewise, many forms of fats, carbohydrates and mineral matter Some forms of proteins will produce growth while others will not, some that will cause growth are more efficient in this respect than other forms Not all fats are alike in properties or nutritive value, nor are all carbohydrates It is easy to see how much malnutrition might result from selecting foods on the basis of their chemical composition alone

At another time a great deal of discussion took place over the supposed necessity of adding alkali to cow's milk in feeding infants to make it have the same reaction as human milk It has been widely taught that from 20 to 40 grains of sodium bicarbonate should be added to from 4 to 12 ounces of cow's milk This was then diluted and heated to pasteurize or sterilize the milk in order to make it suitable for infants The heating changes the sodium bicarbonate into sodium carbonate, which is very alkaline This was poor chemistry for the amount added was far in excess of the quantity which would be needed to neutralize the acidity of the milk even if it were sour The real effect was to neutralize the acid of the stomach and throw the milk in a fluid condition into the intestine for digestion There may be times when this procedure will be useful but it must be intelligently employed with the knowledge of what is aimed at and accomplished thereby

Since the discovery of the so-called "fat soluble A" and "water soluble B" of milk and their relation to deficiency diseases the routine addition of alkalis to milk acquires a new interest To quote McCollum [2] "the work of a number of investigators has shown that 'Water soluble B' is readily destroyed when an excess of such weak alkalis as soda are added to food" The necessity or advisability of adding soda to milk for infants has been diligently taught to mothers all over the country and it appears that this practice must be eradicated if milk is to have its full nutritive and physiologic value This is a striking example of a good food being weakened in nutritive value as a result of pediatricians following an incorrect theory

A later and popular teaching has been that foods were of value in proportion to the amount of heat they yielded on combustion, this amount being expressed in calories The animal experiments showing the differences in nutritive value of the various kinds of proteins fats carbohydrates and mineral matters have made clear the inadequacy of this method of valuing foods, even if it were not known that much nutrition does not depend on combustion Under this method very improper foods have been advocated and there can be no doubt as to its responsibility for much bad feeding showing itself in malnutrition, especially in infants and children during the period of growth I have recently called special attention to the fallacies involved in the caloric system of food valuation [3] It is thus evident that much of the theoretical pediatric teaching of nutrition has not been such as to promote the most efficient feeding or the best utilization of admittedly good food There have been those who for many years have persistently advised the use of cereals with milk as the best form of feeding for infants and children, basing their beliefs largely on the practical results obtained The cereals were used with the milk not only for their nutritive value, but for physically adapting cow's milk to the digestive tract of the infant, which is quite unlike that of the calf for which cow's milk is produced in nature

The only objection raised to this teaching was that it did not conform to what was claimed to be theoretically correct As the theories have been found to be incorrect, the proper basis for judgment rests with the nutritional results obtained by the various methods that have been proposed It has been found that milk makes cereals more efficient in producing growth and cereals make milk more suitable for infants from the diluent standpoint

One of the effects of food not being in a physical form that is natural to the digestive tract has been experimentally shown by McCollum and Pitz Guinea-pigs died of scurvy on a diet of milk and oats that did not fit their digestive tracts, but the addition of inert matter which prevented the food becoming too solid in the digestive tract caused recovery from the disease The peculiar anatomic structure of the alimentary tract of the guinea-pig makes it difficult to thrive unless its diet contains a succulent vegetable which gives the feces favorable physical characters

and makes them easy of elimination" Many years ago I showed that the proteins of various milks have a developmental function as well as a nutritive value Hardness or softness of the curds depends on the kind of digestive tract they are designed by nature to serve and develop [4]

The practical advantages of cereals with milk as food have recently been demonstrated on a large scale During the late war, Denmark was subjected to a blockade and the people had to be strictly rationed According to Hindhede,[5] beef was so costly that only the rich could afford to buy it in sufficient amounts, therefore, to quote, "reliance was placed on our potatoes and the large barley crop, which was given to man and not to pigs as heretofore, with the results that the pigs died of starvation, but the people received sufficient nutrition The principal food was bread made of whole rye, plus wheat bran and 24 per cent of barley meal, barley porridge, potatoes, greens, milk and some butter People entered no complaint and there were no digestive disturbances" Sugar was not mentioned, as this is not a necessary article of food and has only been widely used for a comparatively short time Various sugars that are frequently consumed in excess are not always necessary and are sometimes harmful It is only during the last three centuries that sugars have been used at all as foods They are not infrequently the cause of faulty metabolism Cases have been recorded in which hyperglycemia has been found with little or no glycosuria [6]

During the year of severe regulation in Denmark the death rate dropped 34 per cent, being 10 4 per thousand Hindhede says "It would seem, then, that the principal cause of death lies in food and drink The people must first have bread, potatoes and cabbage in sufficient quantity, and then some milk If Central Europe had adopted this plan there would have been no starvation or malnutrition It seems to me that the German scientists, as represented by Rubner, have not learned anything from the war"

It will be found that practically all experiments in nutrition, whether conducted on animals or on human beings, show the most efficient foods to be cereals supplemented by milk and green vegetables This is contrary to the common belief that meat, from its similarity to human flesh, is more suitable for conversion into bodily tissue than vegetable protein It should be remembered that meat is not absorbed as such but is broken down into amino-acids, which are then recombined to make the specific body tissues that are peculiar to each species of animal The real test for proteins rests in their supplying the requisite kinds of amino-acid, not whether they are of animal or vegetable origin

One of the most active causes of social unrest and discontent is the high cost of living, and this high cost is largely due to false theories of what is really needed for proper nutrition One way to lessen this high cost is to diminish the use of animal food and depend more on milk, cereals and vegetables Proteins, carbohydrates, and even to a certain extent fats, can thus be satisfactorily administered As food transformers and producers, animals are very expensive To show the efficiency of various food-producing animals as food transformers, that is, to show what proportion of the food they eat becomes available as human food, Jordan [7] has reduced to a basis of dry weight the intake of digestible nutrients and the output of materials suitable for human food, as follows

From 100 pounds dry nutrients Cows produce 18 pounds milk solids, 9 4 pounds cheese solids, 5 44 pounds butter, steers produce from 2 5 to 3 5 pounds meat solids, sheep and lambs produce 2 6 pounds meat solids, pigs produce 15 6 pounds meat solids, calves produce 8 1 pounds meat solids, fowls produce 4.2 pounds meat solids and 5 1 pounds egg solids

Hopkins states that "1 000 bushels of grain has at least five times as much food value and will support five times as many people as will the meat and milk that can be produced from it" Meat can never be cheap unless animals can be fed rough materials that would otherwise be wasted, and dairy products cannot be cheap with labor and feed both high When meat is used, the cheaper cuts, if properly selected and prepared, will serve as well as the most expensive portions

In countries where population is dense, as in Japan and China, meat and milk are not used to any extent because the food needed to produce them can be used to better advantage by the people, and land is so thoroughly cultivated that there is little or no rough, nonutilizable human food material that could be used to advantage by animals Zavitz of the Ontario Agricultural College, in an intensive study covering three years, found that in the case of a steer, for each pound of meat as sold by the butcher there was required about 3 9 pounds of milk, 5 9 pounds of concentrates, 7 7 pounds of hay and 20 5 pounds of succulent feed These data exemplify the fact, already noted, that animals are highly expensive as food transformers

Pediatricians can render the nation no greater service than to start the feeding of infants and children with foods that will be efficient economically as well as physiologically Habits and tastes formed in early years have much to do with food customs lasting all through life, and children should be taught to live on simple, nutritious and inexpensive foods This should form part of their education The palate must be educated as well as the brain

An amusing incident of how opinions change at different epochs on the food question, because of habit, is cited in the following quotation from J Russell Smith [8]

There is a pitiful tale of woe in the State Archives of Maryland, where it has rested since it was sent up to the Royal Governor about 1680, by the inhabitants of one of the islands on Chesapeake Bay They petitioned that he should send them from the royal bounty some food, for they were about to starve They went on to rehearse that their crops had failed and that they had been forced to such extremities by the approach of starvation that they had been compelled to go down to the bay dig up oysters out of the muddy waters and eat them

As the food that is craved, or considered best, is that for which a taste has early been created, it is peculiarly within the province of the pediatrician to influence national food habits Food costs can often be reduced and better nutrition obtained at the same time As an example, one of the future sources of

protein and fat, as a possible substitute for meat and milk, will be soy beans, which contain twice as much protein and fat as meat Soy bean gruel flour contains 44 per cent protein, 20 per cent fat, 10 per cent sucrose, 4 3 per cent ash, 2 per cent fiber and 4 6 per cent water[9] It has been used successfully in feeding diabetics and also in nourishing infants when cow's milk is not well tolerated By combining this flour with other cereals we may produce a fairly balanced diet that may be administered in the form of bread, breakfast porridge, soups, biscuits and even cake All possible food sources of the world should be searched by scientists to find other food supplies that will be at the same time nutritious and economical This is one of the most fruitful fields wherein a physician can be of service to the state in trying to allay one of the greatest sources of social unrest Finally, trial, experience and results, rather than mere theory, must prove the final test of the utility of any plan of nutrition

ABSTRACT OF DISCUSSION

DR. JOHN FOOTE Washington D C Dr Chapin emphasized the necessity for active interest by this Section in the education of the lay public He says that one out of every four men examined was found to be physically defective The U S Public Health Service says that one out of every three men examined was found to have some physical defect When we remember the large number examined, and realize that at least a million men were suffering from physical defects which curtailed their working and earning capacity we can appreciate what this means economically to the United States Sir Arthur Newsholme the great English authority on public health, said a short time ago that they found a similar condition of affairs in England and that it confirmed a belief they had long entertained that the function of child welfare work in the education of the public was something that should be vested in the local or national health department, in order that it might be enforced They found that in England were a great number of persons for whom they could do nothing because they were suffering from diseases which ought to have been corrected when they were children—perhaps, in the case of some of them, before they were born by proper education of the mother That is the condition existing here now If we are to do anything about it it is properly a function of the physician and particularly of those interested in diseases of children What would we think of a corporation that had no cost accounting system and yet boasted about the great amount of business it did? We have really no cost accounting system in the United States, in respect to infant mortality, in many of the states of the Union no attempt is made to register births, and in some states where birth registration prevails, very little help is given local medical men to enforce it

DR LEWIS W HILL, Boston The general impression prevailing among medical men, as well as among the laity is that children need a great deal of protein food, in order to thrive and grow I do not feel sure that this is true, or that our old standard of 2 gm of protein per kilogram of body weight is correct It may be a good deal less than that Accurate figures of the protein requirements of children are not available Nobody has any adequate idea as to what these requirements are Last summer I saw three boys who bore out very well what Dr Chapin said I never have seen more healthy boys They were athletes, ranging from 12 to 16 years old They were perfectly well in every way They had always been vegetarians The mother of these boys wanted to know whether this was a suitable diet for them They weighed from 10 to 15 per cent more than normal children of their respective ages and they were also taller and bigger than most children of those ages would have been We worked out their nitrogen metabolism and found that they were receiving a very adequate supply of nitrogen apparently Those boys had never had any animal food of any sort and still they had developed normally in every way

DR HENRY DWIGHT CHAPIN New York My object in presenting this paper was to show the wide field that the pediatrician may and should occupy not only in treating individual cases but in approaching broad social questions and this certainly is one of the most important ones At a time when laboring men are striking and crying for porterhouse steaks and everyone is feeling that the food question is so very important we can simplify it a great deal and the time to simplify it is at the beginning of life We can give a thoroughly balanced nutritious diet from the beginning and carry the child through puberty to manhood or womanhood with a thorough development on food that is nutritious and at the same time economical That is the great public question of the day and the pediatricians are going to solve it

THE TEACHING OF MEDICINE

A G ELLIS M S M D
Professor of Pathology Chulalongkorana University
BANGKOK SIAM

I have been greatly interested in recent articles in THE JOURNAL and elsewhere, dealing with medical education Foster Wood, Symmers Hare, Bastedo and Vaughan have presented various phases of this subject The report of the Congress on Medical Education and Licensure with its committees regarding teachers and teaching is evidence of an increasingly active interest in the problem by that influential body All this is extremely gratifying to those who are teaching medical students because inquiry and discussion always mean betterment of existing conditions Many things might be said for or against numerous questions raised by the foregoing writers or by participants in the congress Instead, I wish to present a view that is broader than any of these, but which at the same time is intimately related to most of them

One burden of many of the articles to which reference has been made is that the curriculum of medical colleges is overcrowded With this all teachers will agree Yet some departments are insistent in their demands for additional hours in the schedule and still other subjects possibly should be added What is to be done? Suggested remedies are few and excepting that of making postgraduate work of waiting subjects, disappointingly indefinite So far as I have read, no one has referred to improvement of existing methods of teaching as a possible aid to the overloaded curriculum I believe that much of a practical nature for the relief of present conditions can and ought to be done by teachers themselves In this way concrete help may be afforded the more or less abstract efforts of authoritative curriculum makers I wish to suggest three ways in which the time now used for teaching what is on the schedule may be lessened If this can be done scheduled subjects now slighted may be given more time and others may possibly be added

1 DEVOTE LESS TIME TO LABORATORY INSTRUCTION

In these days of emphasis on laboratory training as a foundation for clinical medicine and when laboratory expansion is a dominant note this statement may sound as the voice of one crying in the wilderness Nevertheless, I believe that many hours can thus be saved without detriment to the laboratory

student's education I do not say, "Give less laboratory instructions", I do say, "Give less time to it" The two are not synonymous The problem, as I see it, is one of efficiency The business man installs filing systems, card indexes and adding machines, shortens methods, systematizes his work, and is able to accomplish much more in less time, then he takes on more business In my opinion this principle can be applied in our laboratories with a saving of time and no sacrifice of knowledge imparted, in fact, improved methods of teaching should result in the student's learning more in the shorter time

In illustration For seventeen years (exclusive of one year in Siam) I have been teaching morbid histology, and I have acquired a very positive belief that eighty well chosen sections are sufficient for this course, instead of from 100 to 150 or more, as are usually employed With these can be given all the knowledge of morbid histology that a second or third year student should be expected to acquire This statement is based on observation of how students work in laboratories and on the fact that only a very small percentage (one or two) will study sections after leaving the laboratory The exact working out of this reduction problem in each laboratory will in the final points depend largely on the individual in charge Regarding my own method of teaching morbid histology and how I would apply it on the suggested basis, I hope later to write with some detail, that would be out of place in this article, which is intended to be broadly suggestive rather than insistent on personal ideas

Suffice it to say that the eighty sections should be stained by technicians, the student's time being too valuable to be occupied with this work Those sections in which the lesion is well shown by hematoxylin and eosin could be kept as loan collections The others should be freshly stained by van Gieson's stain because many lesions cannot be satisfactorily demonstrated in eosin preparations, though this is often attempted With this fundamental requirement as to sections; with properly systematized demonstrations (didactic and lantern), and a sufficient number of demonstrators, I believe that a practical instructive and quite satisfactory course in morbid histology can be given in 100 hours If so, why use from 175 to 200? We are teaching future practitioners of medicine, not technical laboratory experts, morbid histology is part of a greatly overcrowded course, and the prime object of a medical college is to teach the prevention, diagnosis and treatment of disease Special work may require further histologic knowledge on the part of a few this is postgraduate or vacation work, as all specialties must be

Now, if this reduction process can be applied to morbid histology, why not to normal histology bacteriology, chemistry, physiology? The questionnaire reported to the congress gives to histology (including organology) and embryology 280 hours I am asking those teachers whose composite figures are 280 hours whether, in case an official edict (as may well happen) requires less laboratory time in order to balance the curriculum, they could not give students essentially the same facts in 200 or an even smaller number of hours? I feel sure that if thus presented the students will have no difficulty in acquiring them in this lesser time

In the bacteriologic laboratory are we requiring students to learn the characteristic growth of each organism on six to ten different mediums? This is knowledge which only expert bacteriologists have the least reason for possessing In the physiologic and chemical laboratories are there exercises which theoretically appear desirable but which really are nonessential, or are beyond the capacity of the student to grasp or the curriculum to accommodate? Is biologic chemistry justified in asking for 260 to 280 hours? I ask these questions as a laboratory teacher and a firm believer in the value of laboratory training Are we doing what we should do in the least possible time or can we do this essentially as well in less and hand over to the student a goodly number of hours to be used in the study of patients? I have stated what I believe I can do in my branch

Army officers report that one of the noticeable things in the medical service of the training camps during the war was the inability of graduates of recent years to make physical examinations and give a diagnosis More bedside instruction of students is very properly the suggested remedy But whence are the hours to come? I believe that a not far distant future will point to the laboratories Let us, then, to use a phrase beloved of politicians, have "reform within the party" before it is forced on us from without To maintain the valued place of laboratory training in medical education we should not only avoid undue expansion, we should retrench wherever possible

2 REDUCE THE TIME DEVOTED TO LECTURES

Some lecturers give value received for the hour spent by students listening to them Many do not Why not apply the same principle just suggested for laboratory workers, in some of the following ways, for example? Give only the essentials in an orderly form with outlines and headings that students can follow and incorporate in their notes As a rule, spend little time on theories unless there are no available facts Quotations from literature should have a minimum of space, even as illustrative quotations Textbooks are not to be used as lectures, they are for students to read The lecturer's time is better spent in explaining the content of the book, with homely language and illustration not considered worthy of printing This is because most textbooks are written in fear of critical reviewers rather than with a righteous regard for the student learner Lectures should not be intricate dissertations for the delectation of learned men, but clear, concise presentations of the subject at hand, designedly at the level of the student's understanding Remember you are to hold him to account later for what he has obtained from these hours

I think that one trouble with us as teachers is that we become more or less fanatical and develop the obsession that our branch is the only one really worth while Therefore, we must deliver it to students complete—facts, statistics, theories, speculations, probabilities and even possibilities A very laudable ambition indeed—if possible to execute But the student can take only a very small, carefully prepared, digestible or even predigested portion of this great mass of knowledge and theory He has almost to be desensitized to this foreign protein How easy to give him mental anaphylaxis with a ponderous dose in the shape of a badly prepared, abstruse lecture!

Another reason for lack of preparation and condensation of lectures is pure inertia (Were I not including myself as a teacher in these statements, I would have used the word laziness) It is much easier to say a thing in fifty-five minutes than in forty,

or to devote sixty instead of forty lectures to a subject when it has enough material for 100 or 200 Boiling down, systematizing, outlining selecting, rejecting—all this is time-consuming and tiresome and even vexatious when one has little enough time to keep himself informed of progress in his own branch, to say nothing of related branches But emphatically it is the business of a teacher so to do He has no right to do otherwise It would have been much easier for me to put these few ideas in a ten-page article instead of the length it is But I have no right to ask you to read so much to get a little And yet you can read this or not as you choose, the student must get the substance of his lectures, no matter how it is served

How, then, can we apply the reduction process to lecture courses? By condensing, by giving fundamentals instead of recent unproved speculations and experiments Instead of a continuous talk with no divisions, give headings and points, you, as well as the student, can follow it much better Cut the regular course 10, 20, 30 per cent in time If the one hour period be deemed the best length for lectures, reduce the number Dividing the session into at least two terms will aid in this With the whole session as a term it is very easy to extend through it a course of lectures that really could be given in considerably less time The shorter term will help condense the work I am not one of those who believe that didactic teaching should be entirely eliminated Lectures permit giving to an entire class systematic instruction that cannot as well be given in laboratory or ward But much can be done toward lessening the time devoted to them

3 SAVE TIME BY MORE INTIMATE CORRELATION OF DEPARTMENTS

This means real teamwork To institute it, the members of the faculty and their first assistants should meet and arrange in exact detail the subjects and parts of subjects each department is to handle For instance, that portean subject inflammation is discussed in some of its phases by every department, and necessarily so But only one department should deal with the general pathology of inflammation as a tissue process That department is pathology, because it has the gross and microscopic material with which to demonstrate the tissue changes Then the surgeon and gynecologist and obstetrician and others should not take up these points Let them deal with the symptoms and diagnosis and treatment of inflammation of the organ they are discussing Let them tell what to do with abscess of the lung or liver or pelvis, but leave out the description of *an abscess* In the same way the pathologist describes types of inflammation of mucous membranes, the clinician shows cases of these, gives symptoms and treatment, but does not take up half his hour describing catarrhal or diphtheritic or hemorrhagic inflammation as such Repetition is admittedly the way in which one learns, but the length of the medical course does not permit of several departments giving the same subject

In the same way a course on surgical anatomy, if it be given, should not spend most of the time with details of descriptive anatomy, problems of the surgeon are to be uppermost Diseases of the blood are to be handled by the medical or pathologic department, not by both How much of the subject of syphilis is considered by the genito urinary department, the pathologic department and the lecturer on etiology? Many similar problems will present themselves in the conferences mentioned Time can be saved if they are adjusted with the knowledge and consent of those concerned If left to the dean or the curriculum committee, satisfactory results will not be secured

But, says some one, I must go over this work that belongs to another department because there it has not properly been taught This sometimes is too true but it is very easy to overdo this accusation Such a spirit engenders sarcastic ideas and references to other departments and interferes with good teaching It is so easy for the morbid anatomist or histologist to intimate gently but firmly that he has to spend much time making good the deficient instruction in the anatomic department And the staff in clinical medicine and surgery and obstetrics bemoan that pathology has not been properly taught And the pathologist waxes sarcastic over mistaken diagnoses by clinicians

As a help along this line, I believe that these conferences to divide subjects can well discuss methods of teaching and their results as viewed by other departments Let the various branches compare notes and the teachers say to each other in a friendly spirit what they have been saying to others in sarcasm or hurtful criticism Determine what is needed from each to give students a well balanced course and then each do his part Each should be willing to give up teaching hobbies if these do not fit in the general scheme or are not conducive to real teamwork Finally, if there is a department that really is not doing its work properly or will not cooperate with the others, these conferences will show this and the governing board can act accordingly

In connection with these teachers' meetings it should be noted that I suggested the inclusion of first assistants (whatever their title) not only because they spend much more time with the students than do the heads of departments (in other words do most of the teaching) but also because they get more of the student's point of view The student dare not approach the professor with his difficulties, but he feels fairly free to unburden himself to assistants And I am speaking not only for the student body but also for the teachers when I say that the ideas and suggestions of the former are not to be disregarded They are young men many of them well along in the twenties, and not a few of them have previously taught school And every one knows whether the teacher whether professor or instructor is presenting his subject in a way that can be understood They are not to be asked to prepare the curriculum or to decide just how subjects are to be taught, but their comments on the effectiveness of teaching methods are most valuable I have learned much from students

CONCLUSIONS

The medical curriculum is now overcrowded and still other subjects in modern medicine are waiting to be added

The demand for increased hours for subjects now on the schedule especially laboratory branches is making worse instead of relieving this condition

In this article are offered suggestions for practical relief by lessening the number of hours given to each subject except the actual study of patients

The principle advanced is that of applying efficient methods to teaching with the idea of

same knowledge in less time In laboratories, condense to essentials, in lectures, give systematized fundamentals without aiming at entirety, between departments, secure real teamwork

The medical school that effectually utilizes this principle will be blessed by its students and honored wherever its graduates may serve

THE DIAGNOSIS OF HUMAN PLAGUE

C L WILLIAMS, M D
Passed Assistant Surgeon, United States Public Health Service
NEW ORLEANS

Much has been written on the diagnosis of bubonic plague in rats and other rodents, but very little has appeared, in this country at least, concerning the disease as it appears in man Diagnosis is a matter of much more than academic interest, particularly to physicians resident in our seaports, for it is the prediction that it is only a matter of time when this disease will appear in many if not all of the seaports of the United States When infection does occur, the first observed manifestation will be a human case, and for the diagnosis of this dependence must primarily be placed in the practicing physician

The early discovery of the occurrence of plague infection in a community is of supreme importance In the United States, methods of control have been developed which can with certainty be depended on to limit and eradicate plague infection If the infection is discovered early, control measures can prevent hundreds of human cases and can almost at once eliminate the danger of spread to other cities, hence it certainly behooves us to be acquainted with at least the principal clinical signs and symptoms

Unfortunately, textbooks give little attention to plague, and their descriptions of the disease are usually generalizations without outstanding points that may stay in the reader's memory There are good descriptions of plague in the literature, but mostly these are in books on tropical medicine, too seldom studied by the average physician For a more extended description than is given herein, the reader is referred to Stitt's[1] "Diagnostics and Treatment of Tropical Diseases" Since my intention is to emphasize the "high points" of plague, no lengthy or very detailed description is being attempted

TYPES OF THE DISEASE

Plague occurs in four forms, only one of which far exceeds the others in importance They are, in order of frequency and importance to the American physician, bubonic, pestis minor, septicemia and pneumonic Of these, bubonic is far and away the most important to us, since it is the type that is most likely to occur in this country Recently there has been a small outbreak of pneumonic plague in one of our western cities, and it is realized that should another such outbreak occur and get beyond control, a fearful epidemic might ensue, but the chances of this are regarded, on good grounds, as remote compared with those of bubonic cases making their appearance

Bubonic Plague—There are three principal symptoms of this type of plague, and one clinical sign, surely a small array to remember The symptoms are sudden onset, rise of temperature and marked prostration The sign is the bubo The onset is usually quite sudden, the patient feeling well in the morning, say, and very sick before the end of the day At onset frequently appears mental haziness and disordered motor coordination resembling similar conditions in some stages of alcoholic intoxication A chill is quite common The temperature varies from 100 to 106 F, with 102 as the average Prostration is as marked as in severe influenza, or more so, on the fourth or fifth day of the disease the patient is apt to be semicomatose and limp as a bag of meal These signs may vary in degree, cases sometimes being seen which merge into pestis minor The usual picture is that of a very sick man with temperature of 102 or thereabouts, who complains of a bubo Minor symptoms are full but rapid and compressible pulse, injected conjunctivae and flushed skin The important point is the association of these symptoms with a bubo The plague bubo is characteristic

The bubo, nine times out of ten, is femoral and virtually always on one side only Occasionally axillary buboes occur due to infection through flea bites on the hand or forearm, and very rarely the glands of the neck are the ones affected Since, however, the rat flea usually bites man on the lower portion of the leg, we find that scarpa's triangle on one leg or the other *is the site of election* It *is not to be inferred* from this that the inguinal glands above the bubo are normal—far from it, as a rule, but usually a glance is enough to determine that the main mass is below Poupart's ligament, though a lesser swelling frequently appears above it

The bubo has four main characteristics It appears coincidentally (approximately) with the onset of the disease, the swelling is caused by infiltration of the tissues with fluid at least as much as if not more than by enlargement of the glands, the skin immediately over the bubo is hot and red, and the mass is exceedingly tender and painful to the touch The bubo is an entity not a string of enlarged glands, but a mass of acutely engorged necrotic glands embedded in gelatinous inflammatory tissue It appears suddenly and does not suppurate until a week or two after the onset, if at all Unlike venereal buboes, it shows a broad, flat surface, seldom coming to a point When seen within the first three or four days, the individual large glands can be made out, thereafter the infiltrated tissue toughens and only a large hard mass is palpable

Minor signs are palpable spleen, large liver and occasionally the presence of a blister or 'phlyctenule" on the extremity carrying the bubo The last occurs only in about 5 per cent of cases, but should always be searched for because, if found, it renders diagnosis exceedingly easy, smears from the contents revealing the typical *B pestis* in tremendous numbers These phlyctenules resemble blisters with turbid contents, they vary from one-half inch to an inch and a half in diameter

Pestis Minor—Pestis minor is the mild form of bubonic plague It differs from the description above in lacking a sudden onset and prostration, fever is usually present for two or three days, with general malaise The bubo is quite characteristic, but is likely to develop more slowly These cases are usually seen late, when the bubo is hard and only moderately tender The patients usually recover, the bubo being slowly absorbed, occasionally suppurating Cases in which

1 Stitt E R The Diagnostics and Treatment of Tropical Diseases Ed 3 Philadelphia P Blakiston's Son & Co 1919

the patients do not recover pass into the more severe type

Septicemic Plague.—This is the type in which there is an overwhelming infection of the blood, with death in three or four days, without the appearance of buboes. It need not be considered at any length here, for the reason that its diagnosis without previous knowledge of the existence of plague in the community is hardly to be expected. All that the physician sees is a patient who has suddenly been taken very ill, and who dies without showing any definite evidence of what ails him. At necropsy it can be diagnosed definitely if smears and guinea-pig inoculations are made from liver and spleen.

Pneumonic Plague.—In pneumonic plague, we have a relatively rare form of the disease which, however, being directly contagious, is highly apt to become epidemic when it does appear and with disastrous results. It is unlikely to occur in the Southern cities, but from San Francisco and Norfolk on the two coasts North it must be borne in mind as a possible menace.

Primary pneumonic cases seldom occur in warm climates, since for direct droplet infection of the respiratory passages it has been definitely shown that conditions preventing even moderately rapid drying are necessary. For example, the great epidemic of pneumonic plague in Manchuria was associated with tightly closed native homes and a severely cold winter, while in India where pneumonic involvement from axillary buboes is not uncommon, primary pneumonic infection of attendants on such cases is rare.

Plague pneumonia differs from other forms of pneumonia on three points. After sudden onset, the patient is extremely prostrated with almost no chest signs, by the time definite involvement of the lungs is demonstrable, the patient dies. The sputum is watery, never thick and tenacious, and soon becomes very bloody, the sputum contains typical *B. pestis* in large numbers. Pneumonic involvement occasionally supervenes in bubonic cases.

DIAGNOSIS

Plague is one of the few diseases which can be absolutely diagnosed by the bacteriologic findings. Any case still showing well marked signs or symptoms can be positively shown either to be plague or not plague by proper laboratory methods. *Bacillus pestis* can always be found, if it is present.

Procedures for Recovery of the Organisms.—In bubonic plague and pestis minor, the organism is obtained by inserting the needle (18 or 20 gage) of a syringe into the bubo, going into a gland, if palpable, and aspirating some of the gland juice. One or two drops is usually all that can be aspirated, but this amount is quite sufficient. Most of this is used to make smears, after preparation of which 1 or 2 c.c. of salt solution, or just water, are drawn into the syringe, shaken up a bit and portions of it injected subcutaneously or intraperitoneally into two guinea-pigs. In 90 per cent of cases of plague the characteristic bipolar bacilli will appear in the smears, in 99 per cent of cases, one or both of the guinea-pigs will die within ten days, showing the characteristic injection, bubo, large liver and large, granular spleen with the bacilli present in great number in smears. Intraperitoneal injection causes earlier death of the guinea-pigs, but without the appearance of bubo or markedly granular spleen. It has the advantage of speed and the appearance in the peritoneal exudate of a practically pure culture of *B. pestis*.

In suspected septicemic plague 3 or 4 c.c. of blood is drawn, thick smears made and guinea-pigs inoculated. In only a few of these cases will the smears be positive, but the guinea-pigs are quite reliable, having been proved susceptible to as few as three or four bacilli.

In pneumonic plague *B. pestis* is present in ever increasing numbers in the sputum. Guinea-pigs should be inoculated for production of the characteristic lesions in all cases since the microscopic appearance, except to the eye of an experienced observer, is not a reliable guide.

In preparing smears they should be made reasonably thin. After drying in air they should be fixed by passing once or twice through a flame and then stained with carbolthionin, carbolfuchsin or Loeffler methylene blue, preferably the former when obtainable since it brings out best the bipolar staining. The plague organism is a relatively short, thick rounded end or oval bacillus. When it is present in smears from tissues at all it usually occurs in considerable numbers, a diagnosis should never be based on two or three bacilli. Smears showing *B. pestis* have three principal characteristics. The bacilli are lightly stained and a considerable proportion of them show distinctly heavier staining at the two ends shading down to the central portion, which is almost completely clear (the proportion of bipolar stained individuals varies very much in different smears but is almost never 100 per cent). The individuals vary markedly in size from short coccobacillary and round coccoid forms to rods two or three times as long as wide with all intervening sizes. There is no particular arrangement, chains are not formed, and individuals do not lie parallel. In smears from human buboes it is not unusual to find plague bacilli inside of phagocytes.

When any case suspected of plague infection has progressed to the point of finding what are believed to be specific organisms or suspicious lesions in guinea-pigs it should be reported to the proper health authorities as a suspicious case, the absolute determination of the specificity of the organism, which is a somewhat complicated procedure, being placed in the hands of a competent bacteriologist.

POSTMORTEM APPEARANCE

The postmortem appearance of human cases differs somewhat in the various types, except that in the bubo and hemorrhagic pneumonia there are no very marked gross lesions. The bubo cannot be 'shelled out," but must be dissected out. On section it shows the large hemorrhagic necrotic or caseous glands embedded in a mass of blood-stained more or less gelatinous inflammatory tissue. Only the glands themselves are necrotic. The viscera show marked enlargement and congestion of the spleen and liver. Smears from spleen liver and bubo show *B. pestis* usually in profusion. In plague pneumonia large areas of hemorrhagic necrotic consolidation of the lungs appear with plague bacilli in great numbers. Guinea-pigs should always be inoculated for confirmation.

In closing it is proper to emphasize the statement at the opening of this paper that the probability of plague eventually appearing at our seaport cities makes the diagnosis of human cases a matter of highly practical importance and not academic interest.

535 St. Charles Street

CLINICAL MANIFESTATIONS OF INFECTION OF THE LATERAL SINUS*

FRANCIS P EMERSON, M D
Surgeon, Massachusetts Charitable Eye and Ear Infirmary
BOSTON

Infection of the lateral sinus we submit as a comprehensive term covering the subdivisions usually spoken of as phlebitis, sinus thrombosis and septicemia The object of this paper is to differentiate these types, if possible, more clearly, in order that it may be shown that the diagnosis is often exceedingly difficult, even when the facilities of a large hospital are at hand, that the dangerous types may not have thrombosis, and that the cases in which the operative findings disclose complete blocking of the sinus extending back to the torcular have developed more slowly and are the least dangerous Although this subject is one that has been discussed many times, yet no one will deny that many cases are still being overlooked This is particularly true in children and in adults when the symptoms are atypical It is probably true in the past that we have attempted to define too specifically the clinical picture of a complication resulting in infection of the lateral sinus in which the specific organism varies, and where no account is taken of the amount of toxins thrown into the circulation, whether it has been gradual or sudden or of the resistance of the host This complication is not then a disease entity resulting from a specific infective organism, but must vary in its clinical manifestations with almost every case Instead of a so-called typical picture with a chill, a sudden rise of temperature of 104 to 106 F , followed by a subnormal remission and sweating, there may be no chill, no temperature over 100, no subnormal remission or sweating, about the only thing common to all being an increased leukocytosis If the blood stream has been invaded to any appreciable extent there must be an increased leukocytosis The three cases here reported show three distinct types with temperature charts bearing no resemblance to each other, and yet it was necessary to ligate the jugular in all

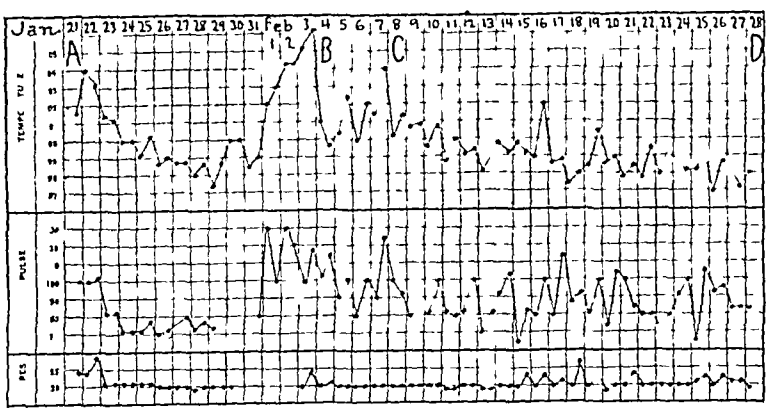

Chart 1 —Temperature pulse and respiration in the case of P B *A* mastoid operation at Infirmary *B* secondary mastoid operation and ligation of jugular *C* white blood cells 17,400 *D*, discharged

PATHOLOGY

The operative findings in mastoiditis in which the sinus is exposed give us no certain evidence as to the present or probable development of a thrombus in the lateral sinus or of the blood stream being invaded We may have a perisinus abscess with the lateral sinus uncovered The sinus wall may not appear normal in color, and may or may not be covered with granulations There may be undoubted resistance to the touch from thickening of the wall, and yet no infection of the blood stream has resulted On the other hand, there may be left a thick and healthy looking plate of bone over the sinus with infection already present The exposed sinus, thickened wall, or change in color are only suggestive, although the first stage, especially when a thrombus is found, is usually a phlebitis involving the thickness of the vessel wall and resulting in roughening of the intima While this in most cases is secondary to a suppurative otitis media and mastoiditis, one case was recently reported by Mosher in which the infection was an extension from a peritonsillar abscess Other cases have been reported as secondary to a labyrinthitis, and in many the blood is the avenue through which the infection reaches the sinus Again, at the time of the mastoid operation, if this has been performed during the congestive stage before the bone inflammation has been walled off by leukocytes, the operator may fail to remove all infected cells These cells about the sinus may later break down, and three or four weeks after the original operation there may suddenly develop symptoms of sinus infection

This is shown in the case of P B (Chart 1); seen in consultation Feb 3, 1920 Eleven days after the primary mastoid operation following influenza, the temperature suddenly rose to 105, with a remission to 99 4 The boy was distinctly toxic, mentally clear with a leukocytosis of 22,000 and 92 per cent polymorphonuclears His reflexes were within normal limits and there was no papillitis The mastoid cavity was filling in with rather flabby granulations There was tenderness over the emissary vein, with slight edema The next day the mastoid was reoperated and the jugular ligated Much soft bone was found at the tip and around the sinus, when the sinus was opened there was a gush of blood but no thrombus The toxemia was in evidence clinically over a longer period than usual on account of the poor resistance of the patient His recovery was uneventful

While the sinus infection may not be present at the time of the mastoid operation, if the sinus has been exposed, more bone should be removed and the edges made smooth in case it needs to be opened later In the preinfective stage, if the invasion of the sinus has been slow and the infecting organism of low virulence, the resulting thrombus is likely to be large and even extend to the torcular

In the case of A M G (Chart 2), the ligation was performed one month after the primary mastoid operation In the interval the patient had had an attack of whooping cough At the end of three weeks the patient commenced to cry bitterly for ten minutes after coughing grasping her head with her hands Before this she was very quiet There was no discharge from the middle ear, and the mastoid was healed, except for a small pustule over the tip There was an increasing leukocytosis which reached 26 000 There were no focal symptoms Physical examination by a pediatrician was negative The temperature was coming down, but the pain on coughing remained and the leukocytosis was increasing It was thought best to explore The mastoid was reopened The aditus was found shut off, and the mastoid

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

cavity in the region of the antrum was healed There was soft bone around the sinus, however, and the sinus wall was found thickened and covered with granulations After ligation of the jugular, when the sinus wall was incised, there was found a thrombus that extended back so far that no attempt was made to remove it A section of the sinus wall was removed and the usual packing applied Recovery was uneventful

These patients often undoubtedly recover without the condition being recognized On the other hand, if a large amount of infective material of high virulence is suddenly thrown into the circulation, there may not be any thrombus found on opening the sinus The incision of the sinus wall will be followed by a sudden gush of blood flooding the entire field, unless controlled by pressure These are the cases in which ligation is urgent, for we now have a septicemia which will be followed by metastases if the general circulation is not shut off

SYMPTOMS

Local—The most constant in my experience has been edema and tenderness over the emissary vein This, however, is only suggestive, for it is present in perisinus abscess and in some cases of mastoditis When the primary periostitis over the cortex has subsided and is followed by edema and tenderness over the emissary vein as a later development, we expect that there is active trouble around the sinus Of less importance, because more rare, is tenderness over the upper part of the jugular vein I have seen it only a few times

General—One of the important symptoms is fever, which may be typical if the patient is markedly septic, but is never typical if the infection is mild but depends on the amount of toxemia In the severe cases we have a chill, temperature from 103 to 106, subnormal remission and sweating, i e, a septic temperature With this temperature there is marked leukocytosis and high polymorphonuclear percentage, and the diagnosis is very easy Here Charts 3 and 4, of P S, are of interest as being typical of a case with pronounced sepsis having the wide excursions between 95 2 and 106 It is also interesting from the age of the patient, as it occurred in a child 13 months old

The baby had an acute infection Aug 1 1919, with several reinfections and finally a general bronchitis August 19 the temperature had fallen to 98 a m and 100 p m August 21 there was a double acute otitis media, temperature 105, double paracentesis within twelve hours August 22, free discharge August 23 11 a m, chill, temperature 105 with remission to 96 4 and marked prostration August 24 4 p m temperature 106 and another chill, ears discharging freely On this date I saw the patient in consultation August 26, the temperature was from 105 6 to 106, pulse 150 respiration, 60, white count 24 000 polymorphonuclears 70 per cent There was no postaural swelling or tenderness, and no sagging of the posterior superior wall The left ear looked like any middle ear with acute infection The right membrana tympani was boggy and we assumed that the trouble was on this side The next day a mastoid operation with ligation of the jugular was done There was a well developed tip cell and antrum with surrounding cells When the sinus was opened the blood flowed sluggishly and then more rapidly no clearly defined clot having had time to form Recovery was uneventful

On the other hand, following the mastoid operation, the temperature, instead of dropping after one initial rise, may be continuos ranging from 99 5 to 102, and extending over weeks Between these extremes there may be any type (as in A M G) Infection of the sinus is one of the most common complications of mastoiditis and should always be suspected Many cases with meningeal symptoms due to a bacteremia from an infected sinus, cannot be differentiated from actual meningitis

The case of E F P soldier seen at Camp Lee, is reported in full because of the complete data even to the testing out of the virulence of the specific organism We believe that the ligation of the jugular and the repeated drawing off of cerebrospinal fluid were the important factors in his recovery Unfortunately, for scientific purposes, he was given some antistreptococcus serum He had already commenced to improve, but the order for the serum, which had been given two days before, had not been withdrawn, and so it was used

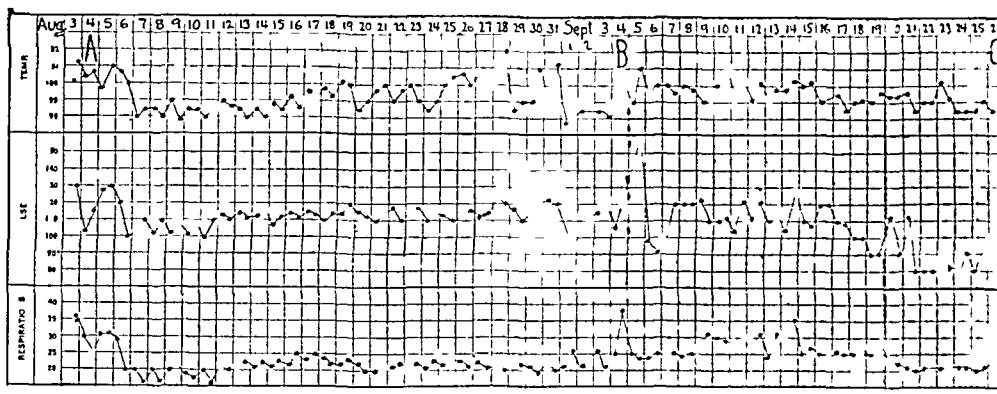

Chart 2—Temperature pulse and respiration in the case of A M G *A* mastoid operation *B* ligation of jugular *C* discharged

E F P private Co K Sixty-Second Infantry, bricklayer whose family history was negative, had had the usual diseases of childhood but no other illness except a right acute otitis media when 16 years of age lasting three days The patient was admitted to the base hospital at Camp Lee Va, Dec 4 1918 complaining of sore throat which had existed for four days previous to admission He had pain in the right ear which started discharging Dec 3, 1918 Examination of the throat revealed bilateral acute follicular tonsillitis *Streptococcus hemolyticus* was obtained on culture The patient complained of slight pain over the right mastoid region A profuse mucopurulent discharge continued to December 7 when it became less marked remaining about the same until December 20 when the membrana tympani was incised a profuse discharge following

December 23 the temperature was 102 respiration 24 pulse from 116 to 120 At this time the patient developed an acute exacerbation of a subsiding tonsillitis with some pain in the mastoid region and tenderness on pressure

During the night of December 27 28 the patient vomited During December 28 29 he became drowsy had a chill There was marked stiffness the back Kernig's sign was positive.

December 29, the patient was somewhat drowsy, he had vomited three times in the last forty-eight hours There was no mastoid tenderness or edema The inner end of the right auditory canal was considerably narrowed and there was some drooping of the superior canal wall The temperature was 103 at noon The first lumbar puncture was performed The fluid was under pressure and was cloudy Culture revealed the presence of hemolytic streptococcus A culture from the middle ear revealed the same organism

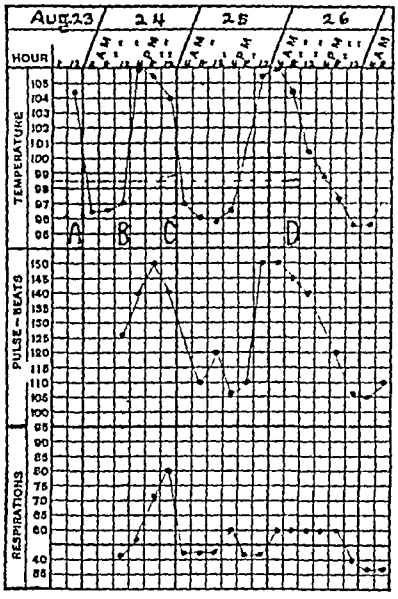

Chart 3 —Four hour chart in the case of P S *A* chill *B* white blood cells 27 000 *C* chill *D* white blood cells 34 000 poly morphonuclear leukocytes 70 per cent

A simple right mastoidectomy was performed The cells were broken down and the cavity was filled with pus under pressure The area of the lateral sinuses was exposed by disease and covered with granulations A small area of the dura over the antrum was exposed by the disease All necrotic bone was removed

December 30 the patient was very restless, with twitching of the face muscles and beginning papillitis of the right eye An inoculated mouse died in four hours As the lateral sinus was exposed and covered with granulations, and as hemolytic streptococci were found in the spinal fluid and isolated from the ear, it seemed advisable to ligate the internal jugular vein, which was done Lumbar puncture revealed 680 mononuclear cells 80 per cent polymorphonuclears There were faint traces of globulation No meningococci were found

Dec 31, 1918, 25 c c of cloudy fluid was withdrawn from the spinal canal revealing 390 cells, 70 per cent polymorphonuclears, smear negative Jan 1, 1919 the fourth lumbar puncture was performed 35 c c of fluid being withdrawn It was clearer than on the previous day, and showed 320 cells, negative smear, and no growth on culture Twenty-five c c of antistreptococcus serum was given intraspinally At 8 p m, 25 per cent glucose solution was given intravenously The patient was restless and delirious, the condition was not very good

January 2, he developed erysipelas on the right side of the face and neck The fifth lumbar puncture was performed Fifty c c of practically clear fluid was withdrawn, and 25 c c of antistreptococcus serum injected, 200 cells, smear negative At 3 p m, 25 per cent glucose solution 550 c c, was given intravenously over a period of one and one-half hours

January 3, the sixth lumbar puncture was performed Seventy-five c c of clear fluid was obtained, and 25 c c of antistreptococcus serum was injected, 300 cells, smear, negative At 10 30 a m, 550 c c of 25 per cent glucose solution was given intravenously over a period of one and one-half hours The general condition was very much improved

January 4, at the seventh lumbar puncture, 35 c c of fluid was withdrawn, 20 c c of antistreptococcus serum was injected, cell count, 250, polymorphonuclears, 78 per cent, smear, negative The general condition was improved, the patient took nourishment well and did not complain The erysipelas was improved The dressing was changed, there was considerable pus from the neck wound, but no discharge from the middle ear

January 5 examination revealed normal eyegrounds About this time some swelling of the right temporal region was noticed with some brawniness of the tissue

January 10, the condition was very good, the ear dry, the mastoid wound clean, with very much less discharge from the neck wound, and the patient was allowed out of bed for two hours The swelling over the temporal region was increasing and the patient complained of headache This *condition increased in severity up to January 25, when* it was decided to open wound to see whether or not there was any pus in the temporal region Operation revealed zygomatic vertical perforation and a large epidural abscess, about 3 drams of pus was obtained January 2, the white cell count was 15,300, January 3, 17 100, January 6, 17,600 From this time on the patient made an uneventful recovery The mastoid wound was clean and in good condition The general condition was very good

In this case there were present mental dulness, positive Kernig's sign, stiff neck, papillitis, turbid cerebrospinal fluid, bacteremia, virulent organisms that killed a mouse in four hours, and yet the patient recovered after ligation of the jugular, and repeated withdrawal of cerebrospinal fluid

When symptoms of meningitis follow mastoiditis, however stormy their character, the jugular should be tied at once Sinus infection is often diagnosed by exclusion If a mastoid operation turns out badly and an exploratory secondary operation reveals nothing wrong in the technic of the primary operation, in the presence of a marked leukocytosis the jugular should be tied, if there are no definite indications of other complications With a septic patient it is safer *to explore than to wait and see what will happen* Every year patients die of meningitis and no attempt is made to ascertain the condition of the sinus Many of these lives, I believe, could have been saved by prompt ligation of the jugular

OPERATION

The jugular, having been exposed by an incision parallel to the anterior border of the sternomastoid and on a level with the thyroid cartilage, is ligated in two places and dropped back into its bed The superficial fascia is brought together by two or three interrupted sutures Lastly, the skin is brought together by a continuous suture and a collodion dressing applied to prevent infection from above With a fresh toilet and a change of gown and gloves, the operator now blocks off and incises the sinus which was widely exposed at the mastoid operation If a thrombus is present and is circumscribed so as to be removed readily, there is no surgical contraindication On the other hand, if the thrombus is so extensive that there is danger of pushing infected material farther on, I feel that it is better judgment to remove a section of the sinus wall and let the thrombus remain It seems faulty technic to remove a clot that is acting as a protection and then block the sinus and have another form that may not be so

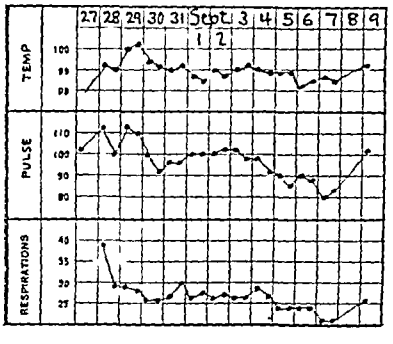

Chart 4 —Temperature pulse and respiration in the case of P S

safe If a clot is not present, iodoform wick is packed down on each side of the sinus wall and then on top, and kept distinct from the general packing of the mastoid cavity for the reason that the sinus packing should not be disturbed for eight or nine days and should then be removed very gradually The mastoid dressing will usually be changed on the fourth or fifth day

CONCLUSIONS

1 Sinus infection should be used as a comprehensive term covering three subdivisions phlebitis, thrombosis and septicemia

2 The symptoms vary with the infecting organism, the avenue of invasion, stage of the complication and resistance of the host

3 The diagnosis can be made only by a study of the history, local conditions and blood findings

4 There is no typical picture

5 In septic cases with bacteremia, all the symptoms of meningitis may be present

---

ABSTRACT OF DISCUSSION

DR CULLEN F WELTY, San Francisco I saw four cases without any symptoms whatever in which complete obstruction of the sinus was discovered at operation I think many cases of sinus thrombosis are not detected These cases were found accidentally, in two, the sinus was full of pus, in the other two, an infected thrombus was present

As I understand it, Dr Emerson ligates the jugular in every case I think it is a nice point to decide when to ligate and when not to ligate the jugular In some instances ligation is not necessary and in others it is quite important The invasion of the sinus does not begin as a clot infecting the whole sinus There is a small invasion or a deposit on the inside of the vessel, which is called a mural clot, that only partially obstructs the vessel and as it increases in size complete obstruction occurs I maintain that in this mural clot (which the Doctor did not find) he had an infected sinus just the same, but in this particular case you do not need to ligate the jugular Furthermore, if the jugular is ligated it is bad surgery to drop the ligated vessel back into the wound and cover it up because there is a piece of the thrombus within the ligated and covered up vessel or an infection of the vessel wall In getting rid of infection we must do all we can to get rid of every possible bit of that clot When the jugular is ligated go down until bleeding from the petrosals occurs if possible Sometimes the petrosals are likewise thrombosed Then go to the distal end and remove the bone until a healthy sinus is in view then curet the sinus until free bleeding occurs I do not think it good judgment to put a tampon into a sinus that does not bleed freely The cases that have not had a speedy convalescence have been those in which I could not get free bleeding from the posterior wound

DR JOHN F BARNHILL Indianapolis The internist often sees these patients first and does not always recognize them until too late It is the experience of many that if these patients are seen early by the otologist and operated on a vast majority of them will get well, whereas formerly when classical symptoms were awaited most of them died Dr Ewing W Day, of Pittsburgh reported six cases of sinus thrombosis without any fever or little fever and now Dr Welty reports four cases without fever Such reports serve as a warning always to be on guard I never have seen a case of this type, but possibly I may have overlooked some cases that were thus atypical Diagnosis is most important and these reports of cases lead us to believe that there are several types of sinus thrombosis and that therefore we should be on the lookout for some type in almost every case of aural discharge I have never seen a case of lateral sinus thrombosis with temperature so low as Dr Emerson has stated in two cases the temperature did not exceed 101 F We should bear such possibilities in mind

I have seen four cases such with no symptoms whatever except a continued temperature of septic type In three of the four cases there were no aural symptoms and no history of ear disease, except that there had previously occurred a discharge that had not continued longer than twenty-four hours Concerning the question of dropping the stump back into the wound I have always followed that plan, and have never seen any ill results

DR LEE W DEAN Iowa City In my judgment in every case where it is necessary to ligate the internal jugular the gutta-percha drain should be left at the lower end of the wound

DR H H MARTIN Savannah Ga A boy of 20 who had had chronic otitis from the first year of his life following scarlet fever had a large granuloma in the ear filling the external canal His only complaint was frontal headache I sent him to the hospital to have the granuloma removed and incidentally had a blood count made which showed 28 000 leukocytes The next morning he awoke complaining of a chilly feeling When I saw him at noon he seemed to be all right I did a simple mastoid operation with removal of the granuloma I found no pus in the mastoid, but deep down a necrotic groove leading to the tip Immediate improvement followed the operation the leukocyte count dropping to 8 800 About two or three weeks afterward however the symptoms had become just about as they were in the beginning the patient also complained of pain in the back of his neck The leukocyte count was 20 000 I came to the conclusion that I had probably not uncovered the focus of infection in the mastoid and reopened the wound and removed the posterior canal wall He again improved for a few days but complained intermittently of pain in the back of his neck and his leukocyte count remained high Eventually we opened the sinus and found a nonseptic clot a thrombus that was white and shriveled Cultures revealed no pathogenic organism The temperature never was higher than 101 5 F Later there developed clear evidence of cerebral abscess which was evacuated but without any result other than perhaps that the boy lived somewhat longer All the cases I have ever seen had choked disk which appeared about the fourth week Therefore it seems to me that the outstanding diagnostic points in lateral sinus thrombosis are frontal headache vomiting without nausea the presence of a high leukocytosis, pain in the back of the neck and choked disk

DR LEON E WHITE Boston We examine all cases roentgenographically as part of our routine Both mastoids are taken on the same plate so that comparison is easy In a recent case in which the question of involvement of the sinus was under discussion the roentgen ray was most helpful The involved sinus was very much larger and higher than the uninvolved sinus In two cases infection was not suspected until the mastoid was opened In many cases it is extremely difficult to determine the presence of a clot I have had cases in which the assistants declared there was thrombosis but on slitting the sinus there was the usual hemorrhage As to the question of ligating the jugular I feel that this should be done if there is infection enough in the sinus to warrant opening it It is wrong not to eliminate the possibility of its draining into the system If a patient has a high temperature and a high leukocyte count not otherwise explainable we do not dare delay operation Dr Emerson is very apropos in saying that meningitis and sinus thrombosis are hard to differentiate in the early stages Meningitis may be prevented by getting rid of the infection in the sinuses

In the different services at the infirmary there are various methods of handling the neck wound In my service we use metal clips and at the lower angle of the wound we insert a small piece of silkworm gut which is removed in from twenty four to forty-eight hour

DR. FRANCIS P EMERSON Boston Some of the questions that have arisen in regard to my paper I think are due to the fact that I tried as far as possible to keep strictly to the subject and so I went over the operative technic very hurriedly

One case which I reported, in which the temperature was 102 F and then dropped to normal, I think probably would have terminated in recovery without operation But in the presence of elevation of temperature and an increasing leukocytosis, the only safe course is to shut off the general circulation from the infection I do not cut the jugular after ligating it I ligate in two places and drop the entire vein back into the neck The rest of my procedure is almost identical with that which Dr Dean mentioned

MIGRAINE THERAPY

BERNARD FANTUS, M S, M D
Associate Professor of Therapeutics Rush Medical College
CHICAGO

Some years ago, I came across the recommendation by T Lauder Brunton of a mixture of sodium salicylate, 1 gram, and potassium bromid, 2 grams, for the relief of attacks of migraine, which was couched in terms of such enthusiasm[1] that I was led to employ it in suitable cases, and my success with this combination has been such that I have not as yet had the courage to experiment with modifications of the formula

It is essential that the dose be given at the earliest possible moment when the headache is approaching, best, indeed, that it be given before it sets in by taking advantage of the signs by means of which these patients know that they will have a headache In some it is a peculiar nervous irritability at bedtime, in which case the dose should be taken before the patient goes to sleep In other cases, the patient awakens in the morning very drowsy and disinclined to rise, and perhaps with a feeling of weight in the head If he now goes to sleep again, he wakes up with his headache If, at the time when he first wakes up, he takes a dose of the medicine, the headache may be prevented Whatever other "aurae" the patient may have, such as scotomas or fortification phenomena, should be seized on to introduce the dose into the system before emesis takes place, as the presence of vomiting makes the retention of the dose rather difficult I have the impression that imparting effervescence to the medicine favors its efficiency and retention If the whole dose is vomited up, the patient might be able to retain a quarter of it taken in a wineglassful of seltzer water every fifteen minutes If a single dose does not suffice to jugulate the headache, a further dose may be taken hourly, until phenomena of salicylism, such as ringing in the ears, compel discontinuance I have found it rarely necessary, however, to push the remedy to this point

Effervescence may, of course be secured by administration of the dose in seltzer water It is more practical, however, to prescribe the remedy in this form

	Gm or Cc
℞ Sodium salicylate	6|0
Potassium bromid	12|0
Sodium bicarbonate	12|0
Mix and divide into six blue powder papers	10|8
Tartaric acid	

Divide into six white powder papers
Label Mix contents of a white and a blue paper in half a glass of water Repeat dose hourly if required

For very nervous and presumably sensitive persons and for poorly nourished individuals, it is prudent to advise that half the dose be taken at first to see whether or not it might be sufficient In this manner, possibly disagreeable effects, due to idiosyncrasies, would be avoided

PROPHYLACTIC TREATMENT

Of course, the patient is also given a thorough physical examination, including a specialist's investigation of eye, ear, nose and throat, and roentgenoscopy of the teeth, and the attempt is made to eradicate or correct any physical defect found It is just as important to place the patient under optimal hygienic conditions This means the best hygiene for that particular individual an adundance of sleep, a sufficiency of physical exercise (walking) to balance the usual excess of nervous work, a diet that might take cognizance of the idiosyncrasies of the individual and the requirements of daily bowel evacuation, and, above all, the cultivation of equanimity

In some highly neurotic individuals, the prolonged administration of bromid, as in epilepsy, has been distinctly useful in lessening the frequency of the attacks

It may be that, in view of the alleged potency of suggestion in this condition, the confidence with which I prescribe this treatment, and the assertion I usually make that I have a special remedy which I am quite sure will help the patient, may endow it with greater power than it intrinsically possesses I also tell the patient that the prospects as to ultimate recovery are good, since, in the natural course of events, the tendency of these attacks will become less with advancing years I furthermore advise the patient to report whenever a tendency to frequent recurrence manifests itself In this case, the attempt to discover physical or hygienic defects is repeated, and another course of bromid is prescribed, or the dose of bromid that is being taken is increased

Clinical Notes, Suggestions, and New Instruments

ANTHRAX FROM REMOVING HIDE FROM MULE

RALPH KING M D Olney Ill

W L and C L father and son, aged 46 and 21 years, respectively lost a mule by death, March 21, 1920 The animal had been sick nine or ten days with a bad swelling of the head and one front leg There were no sores or nasal discharge and the animal was apparently paralyzed before death About one hour after death the hide was removed and sold They stated that they found water under the skin Forty-eight hours later both were taken ill with chill and a temperature of 103 F A few hours later painful papules appeared on the left index and right middle finger of the father and the external canthus of the left eye and point of the chin of the son These lesions rapidly broke down into discharging ulcers with depressed gangrenous bases surrounded by an edematous induration March 31, they were admitted to the Olney Sanitarium with marked prostration A diagnosis of anthrax was made from the history and physical findings The organisms were later demonstrable in the discharges from the ulcers

The treatment consisted of 40 c c of antianthrax serum given to each in 20 c c doses intravenously at six hour intervals This was followed by a slight reaction Moist dressings of boric acid were applied to the eye, and 50 per cent alcohol to the chin and finger lesions They left the hospital in five days Their convalescence was slow likened by them as to "one that had typhoid' Scars are left at the site of the lesions with no other ill effects No other animals

on this farm or those of their neighbors have had a similar illness

On account of the prostration and the fact that ten days elapsed before their admission to the hospital, we consider their recovery remarkable

TORSION OF SPERMATIC CORD

PETER MARSHALL MURRAY M D WASHINGTON D C
Assistant Surgeon Freedmen s Ho pital

C P, a colored man aged 28 laborer, with negative family h story, who had had a mild case of gonorrhea five years before, with no complications, complained of pain in the paraumbilical region May 29, 1920 had slight nausea and vomited once This attack came on without any apparent cause Next day the pain had subsided except in the lower right iliac fossa, and the right testicle began to swell The testicle was not painful but was tender to the touch and enlarged gradually The patient continued to be comfortable, the pain subsided except on handling of the testicle As no improvement followed rest in bed, elevation, ice bag, etc for forty-eight hours, operation was performed There was a moderate amount of straw colored fluid in the tunica Vaginalis The spermatic cord was twisted inward two and one-half turns just proximal to the globus minor The testicle and epididymis were swollen, dark hemorrhagic, and almost gangrenous Orchidectomy was performed Recovery was prompt and uneventful the patient being up and able to leave the house within a week The symptoms in this case were very mild and after the first day the picture was certainly not one of strangulation

OBSEPVATIONS ON SOUTH AMERICA

II PERU

WILLIAM J MAYO, M D
ROCHESTER, MINN

General Gorgas freed the coast country from yellow fever, but the disease is still to be found in the sparsely inhabited back country, both in northern Peru and in Ecuador General Gorgas was engaged by the Peruvian government to continue the work of eradication, and it is hoped that yellow fever will soon be a thing of the past

In 1532, just forty years after Columbus discovered America, Pizarro with 310 soldiers landed in Peru and overturned the Empire of the Incas In 1535 he founded the city of Lima, which now has about 200,000 inhabitants On viewing the mummified remains of the 6-foot buccaneer lying in state in the cathedral, one visions the great mental and physical force of this man who subjugated Peru in nine years, from the time of his landing to his assassination

Peru is a vast country, half of it unmapped and scarcely explored Between the Andes and the Pacific lies a narrow strip of land on which there is no rainfall It has not rained in Lima for seventeen years, but the dust and general grime are forgotten in irrigated spots containing beautiful trees and flowers Lima is 2½ miles from the ocean, with its port at Callao, 8 miles away The Humboldt Antarctic Current, flowing along the west coast, keeps the climate pleasantly cool, but condenses the moisture in the air between the coast and the Andes and thus prevents rainfall The lack of water is painfully apparent in Peru and has much to do with sanitary failures which even the dryness cannot wholly overcome The country is tropical, and while the air is cool in the shade it is very oppressive on exercise or in the sun The noon siesta, a custom of the country, undoubtedly is based on human needs for it recuperates the body from the results of the heat on the tissues, especially the nerve tissues By dividing the day into two parts, the strain of the most trying hours in the climate of Peru and other tropical countries is reduced, and what might be called a protective neurasthenia, greatly resembling the neurasthenic state seen in the United States, is developed Certainly the siesta, a two hours' rest in bed after the noon meal with the removal of day clothing, is useful in the treatment of neurasthenia In the high valleys between the mountain ranges are fertile plateaus, the home of the Incas The Amazon River, rising in the Peruvian Andes, has a port at the city of Iquitos in Peru which harbors vessels of considerable size A railroad is being built connecting Iquitos with the Peruvian coastal plains

Peru has much to interest the medical sightseer All through South America the hospitals are of Spanish design, excellent for the tropics They are usually of one story, with high ceilings, large high windows, large porch effects for shade, and surrounded by fine gardens In Lima are two large charity hospitals The older, the Hospital de Santa Ana for women and children, boys up to 10 years of age, has a capacity of 300 beds A large new hospital is now being built to replace this old one, in which the government expects to install American nurses and American methods for caring for patients One of the greatest innovations will be the introduction of wire screens against flies Hospital Dos de Mayo for men was founded in commemoration of the victory over the Spanish fleet in Callao, May 2, 1866 The independence of Peru had, however, been declared in 1824 This hospital contains 700 beds and is more modern than the Santa Ana Hospital Miss Soper, a trained nurse from London, has been working courageously for four years to develop a nurses' training school and to improve the nursing and hospital conditions generally The results of her efforts are beginning to show

Several cases of verrugas, a disease of the skin peculiar to Peru, were seen in one of the wards of this hospital The disease is found in the higher Andes and is characterized by fever and eruption The cause is unknown, although it is believed to be the bite of a night insect Most patients recover, but there are fatal forms, when hemorrhages occur under the skin, forming pustules

Both the Hospital de Santa Ana and the Hospital Dos de Mayo are maintained, as indeed are all municipal charities, from the public charity fund, which is accumulated by private contributions and public amusements

The Italians, of whom there are many in Peru, maintain a good hospital, and the French also have a very good hospital of forty beds There are a number of private hospitals, notably Dr Febres, which is quite modern in its appointments Dr Graña's hospital with a capacity of 100 beds, now being built on the seashore about 3 miles from Lima, will be the last word in modern construction and equipment American nurses and a nurses' training school will be installed There are several excellent hospitals connected with Amer-

ican mines in Peru, with American physicians and nurses

Lima has 120 physicians, twenty of whom are surgeons The surgical technic is far in advance of hospital installation, and the highest praise should be accorded these men for their excellent work, which is further illustration of the fact that surgical results depend on the surgeon and not on his surroundings I attended many interesting clinics and saw Dr Gasañeta, Dr Aljovin, Dr Carvallo, Dr Denegri, Dr Morales, Dr Graña, and others doing clean, careful and skilful surgery Physicians qualified to do good roentgen-ray and cystoscopic work are needed in Lima

San Marcos University in Lima, the oldest in the Western Hemisphere, was founded in 1551 Señor Ngarteche Prado, president of the university, is a talented, gracious gentleman, fully equal to the duties devolving on him in the management of this great university, the only one in Peru, with its 4,500,000 inhabitants The university medical school is also in Lima and is the only one in Peru, it has about 300 students The spacious buildings are in beautiful grounds Dissecting material is ample The laboratories in charge of Dr Hercelles, professor of bacteriology and pathology, are excellent There are many unusual and beautifully preserved specimens in the museum of the medical school and in the laboratories The university impresses one as being in every way a real teaching institution

Primary school education, a course of six years, is compulsory in Peru, the secondary course of six years has a limited attendance The medical student must add to the two courses two years of science and seven years of medicine, making in all nineteen years of study to obtain a medical degree The exceptional student can reduce this period two years Medical students are much alike the world over, and one of their great virtues is their independent spirit, with little respect for tradition or authority To the medical student Thomas must be the greatest of apostles Our reception at the medical school by the faculty and the students was most impressive and formal In reply to some very beautiful eulogies of the United States, Dr M with characteristic felicity said that he wished to congratulate the students on the high character and professional attainments of the Faculty of Medicine There was no student applause He then said that he wished to congratulate the faculty on the extraordinary fine body of students they had to teach, and although these remarks were in English, the student applause was uproarious and long continued

The Peruvian Surgical Association, made up of men distinguished in the profession, have their headquarters in a fine building in Lima The visitor interested in medicine leaves Peru with profound respect for its medical profession

In the matter of industrial achievement, Peru is one of the most backward of the countries of South America, largely because of the lack of means of communication between the different parts of a country containing about 700,000 square miles of land broken up by great ranges of the Andes mountains The population, as represented by the upper classes, is refined, intelligent and progressive Their ideals are essentially those of North America, and they are developing along similar lines The lower classes are engaged in small agriculture, they are industrious, but, like children, are easily led by noisy political demonstrations

The bullfight still flourishes in the old ring at Lima, built nearly 200 years ago, but it is not very popular and will soon be abolished Several surgeons in Lima told me that they had never seen a bullfight The bullfight has its points of interest to those interested in comparative anatomy, and it requires skill and courage It is not, however, as exciting or as dangerous to the human participants as football, but, like our North American sports, it permits the multitude a great deal of vicarious exercise on the principle that it is much easier to allow some one else to undergo exertion than to take setting up exercises themselves There are no public lotteries or open gambling in Peru, but there is little attempt to control the liquor traffic

Besides the yellow fever, cases of a mild form of bubonic plague are frequently seen in the northern back country, many are "walking cases," and account for the virulent flare-ups which occasionally call public attention to the matter Such conditions are characteristic of all the countries

The United States is popular in Peru Without the protection of the United States it is probable that Peru would have a struggle to maintain her political integrity, the people of Peru are not warlike, in contradistinction to her more aggressive neighbors

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION W A PUCKNER, SECRETARY

STERILE SOLUTION OF LUTEIN-H W D—Each Cc contains the water soluble extractive of 0.2 Gm of Lutein-H W D, freed from protein in physiological solution of sodium chloride

Actions and Uses—See general article on Ovary, New and Nonofficial Remedies, 1920 p 201

Dosage—1 Cc daily intramuscularly It is claimed that the solution may be given intravenously with no reaction other than urticaria

Manufactured by Hynson Westcott and Dunning Baltimore No U S patent or trademark

Ampules Sterile Solution of Lutein H W D—Each ampule contains more than 1 Cc sterile solution of lutein H W D

Sterile solution of lutein H W D is made by extracting lutein H W D with a solvent composed of equal parts of alcohol and water The extract is freed from proteins by addition of lead acetate and subacetate After removal of the excess of lead the liquid is freed from alcohol and the concentration adjusted so that each Cc shall represent the soluble extractive of 0.2 Gm lutein H W D in physiological solution of sodium chloride

OVARIAN RESIDUE-H W D—The residue from the fresh ovaries of the hog after the ablation of the corpus luteum

Actions and Uses—Ovarian Residue is used for the same conditions as the entire ovarian substance but is claimed to have the advantage of being somewhat more stable in composition (see general article on Ovary, New and Nonofficial Remedies, 1920 p 201)

Dosage—From 0.3 to 0.6 Gm (5 to 10 grains) Supplied in the form of tablets only (see below)

Manufactured by Hynson Westcott & Dunning Baltimore No U S patent or trademark

Tablets Ovarian Residue H W D 5 grains—Each tablet contains ovarian residue H W D 5 grains

Ovarian Residue H W D is a grayish powder having a characteristic odor It is prepared from the entire fresh hog ovary by removal by mechanical means of the corpus luteum The residue is dried and powdered

MEDICAL EDUCATION IN THE UNITED STATES

ANNUAL PRESENTATION OF EDUCATIONAL DATA FOR 1920 BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

The tabulated statistics herewith presented are for the year ending June 30, 1920, and are based on reports received from the medical colleges or from other reliable sources We acknowledge here the splendid courtesy and cooperation of the officers of the colleges who have made the compilation of these complete statistics possible

STATISTICS OF COLLEGES

Table 1, on pages 380-382, gives the colleges in session during 1919-1920, the population of the city, the rating given to the college by the Council on Medical Education and Hospitals, the number of students, men and women, registered during the year, the number of 1920 graduates, men and women, the number of graduates holding collegiate degrees, the number of teachers for each college, the number of weeks of actual work in the college year, the total fees for each year, the executive officer of the college, and the dates of beginning and ending of the next session The figures in heavy-faced type show the totals by states Beginning on page 398 are given essential facts concerning all medical colleges arranged by states

HOME STATES OF MEDICAL STUDENTS

Table 2, on pages 384-385, shows from what state the students came who were in attendance at each medical college during the session of 1919-1920 The influence of the proximity of the medical school is seen in the fact that states having medical colleges contribute more students in proportion to the population than those which have no colleges This is shown by the dark zone of figures running diagonally down the page A comparison of this table with the large tables based on state board examinations,[1] which show the distribution of the alumni of each college, is interesting The college that has widely distributed alumni usually has a student body from an equally large number of states

The state furnishing the largest number of students this year was New York with 2,138 Illinois contributed 1,059 and Pennsylvania 1,038 The next states, in the order of the number of students contributed, are Massachusetts, 765, Ohio, 702, California, 519, Texas, 450, and Michigan, 435 Three states had less than 10 each, these being New Mexico, 9, Nevada, 5, and Wyoming, 5 There were 114 students from Hawaii, Porto Rico and the Philippine Islands, and 269 students from foreign countries

1 THE JOURNAL A M A State Board Number April 17 1920 pages 1084 to 1089 inclusive

NUMBERS OF STUDENTS BY CLASSES

In Table 3, on page 386, the students enrolled in each college are shown by classes This permits one to see whether the attendance at each college is increasing or decreasing The total attendance for the first year was 4,234, as compared with 3,104 last year and 4,283 in 1918 The second year attendance was 2 837, as compared with 3,587 last year, and 3,521 in 1918 The third year attendance was 3 464, as compared with 3,272 last year, and 2,893 in 1918 The enrolment of the fourth and fifth (intern) years, combined this year, is 3,553, as compared with 3,089 last year, and 2,933 in 1918 The first, third and fourth (including the fifth) year class enrolments, therefore show increases, respectively, of 1,130, 92 and 464 over the enrolments in those classes last year This indicates that the college enrolments have largely been readjusted under the higher entrance requirements and the total enrolments in medical schools are again increasing

TABLE 4.—MEDICAL COLLEGE ATTENDANCE

Year	Non sectarian	Homeo pathic	Eclectic	Physio Med	Nonde script	Total
1880	9 776	1 220	830			11 826
1890	13 521	1 164	719			15 404
1900	22,710	1 909	552			25 171
1901	23 846	1 683	664	80	144	26 417
1902	24 876	1 617	760	91	140	27 401
1903	24 930	1 498	848	149	190	27 615
1904	23 662	1 309	1 014	123	234	28 142
1905	24 119	1 104	578	114	232	26 147
1906	23 116	1 085	644	110	249	25 204
1907	22 303	1 039	545	97	292	24,276
1908	20 936	891	419	90	206	22 [illegible]
1909	20 564	899	413	52	227	22 145
1910	20 136	867	436	49	19	21 506
1911	18 414	890	436	49		19 789
1912	17 247	827	308			18 41[illegible]
1913	15 919	850	256			17 015
1914	15 438	794	270			16 502
1915	13 914	736	241			14 891
1916	13 121	638	263			14 012
1917	12 925	580	250			13 764
1918	12 727	540	138		22	13 630
1919	12 259	397	86		310	13 052
1920	13 270	386	93		339	14 088

NUMBER OF MEDICAL STUDENTS

The total number of medical students (Table 4) in the United States for the year ending June 30, 1920, excluding premedical, special and postgraduate students, was 14,088, an increase of 1,036 over last year This is the largest enrolment of students since 1915 It is noteworthy (Table 12, page 387) that in the high grade (Class A) medical colleges both the number and the percentage of students has increased Of the total number of students, 13,220 (93 8 per cent) were in attendance at the nonsectarian (regular) colleges, 386 (2 7 per cent) at the homeopathic, 93 (0 7 per cent)

(Continued on page 382)

E Eclectic H Homeopathic N Nondescript
C Gives only the first two years of the medical course
1 This school has just been moved from Mobile to Tuscaloosa and clinical teaching has been suspended
2 This school has just been suspended
3 The two colleges consolidated teaching in 1918 but retain a nominal existence until 1921 in order to grant degrees to the three remaining classes which are being taught elsewhere
4 The following state universities make an additional charge for students who are nonresidents as follows Colorado $70 Georgia $0 Iowa $1 Kansas $10 Michigan $50 Minnesota, $0 Missouri $10 Ohio $0 Tennessee $40 Texas $100 West Virginia $50
5 This was formerly the Chicago Hospital College of Medicine
6 Figures for enrolment approximate graduates exact
7 Figures are as reported regarding students and graduates They have not been verified
8 Figures for enrolment approximate graduates exact
9 Formerly the Central College of Osteopathy Reported to be conducting both osteopathic and medical courses
10 Ordered closed by trustees in 1919 Has continued for two years until two remaining classes are graduated Will permanently close in 1921

F Eclectic H Homeopathic N Nondescript
* Gives only the first two years of the medical course

†† The Canadian schools count the one or two years devoted to premedical sciences as a part of the medical course

Enrolments include students of all last four years only are shown The fees for the years

(Continued from page 379)

at the eclectic, and 389 (2 8 per cent) were enrolled in three nondescript colleges These three colleges consist of two semi-osteopathic and one nominally eclectic affair Two of them are outlawed in their home state—Missouri—and one is in Massachusetts, which has a feeble medical practice law None of them, therefore, is subject to rigid laws or regulations One of them, the Kansas City College of Medicine and Surgery, exists only by the enjoyment of special privileges obtained through a sectarian licensing board in an adjoining state, the Eclectic Board of Arkansas, even though it is disowned as an eclectic college by the National Eclectic Medical Association

NUMBER OF MEDICAL GRADUATES

The total number of graduates for the year ending June 30, 1920, was 3,047, an increase of 391 over 1919 The number of graduates from the nonsectarian colleges was 2,826, or 403 more than last year The number from the homeopathic colleges was 97, or 8 more than last year, and from the eclectic colleges there were 30 graduates, or 2 more than last year The three nondescript colleges had 94 graduates, or 22 less than last year

TABLE 5 —MEDICAL COLLEGE GRADUATES

Year	Non sectarian	Homeopathic	Eclectic	Physio Med	Nondescript	Total

1915	3 286	195	55			3 536
1916	3 274	166	78			3 518
1917	° 134	180	65			3 379
1918	2,454	114	42		60	2 670
1919	2 423	89	28		116	2 656
1920	2 826	97	30		94	3 047

Of the 3,047 medical graduates, 1,321 (see Table 11) held also degrees in arts or science This total includes those taking the combined courses in arts or science and medicine This year 43 4 per cent of all graduates held collegiate degrees, as compared with 15 3 per cent in 1910 This increase is what was expected under the general adoption by medical schools of the entrance requirement of two years of college work Of the 2,826 nonsectarian school graduates, 1,307 or 46 2 per cent were reported to have baccalaureate degrees, of the homeopathic graduates, 11, or 11 3 per cent, were so reported, and of the eclectic graduates this year, 3, or 10 per cent, held such degrees Of the 94 graduates of the nondescript

GRADUATES HOLDING DEGREES IN ARTS

colleges not one was reported as holding a bachelor's degree in arts or science As will be noted by referring to Table 11, of the 1,321 graduates holding baccalaureate degrees, 224—the largest number—came as last year from the Illinois colleges New York had 168 graduates this year holding baccalaureate degrees, followed by Pennsylvania with 125 and Massachusetts with 114 The percentage of graduates holding collegiate degrees should continue to increase, since all the better medical schools are now requiring two years of college work for admission, which brings more students in reach of the combined course for the B S and M D degrees

WOMEN IN MEDICINE

During the past year there were 818 women studying medicine or 132 more than last year, and 237 more than in 1918 The percentage of women to all medical students this year is 5 8, the largest percentage since the presenting of these statistics was begun There were 134 women graduates this year, 27 more than last year, but 19 less than in 1917 Of all the women matriculants, 89 were in attendance at the one medical college for women, while 727 (90 1 per cent) were matriculated in the 64 coeducational colleges From the one women's college there were 12 graduates, while 122 (91 0 per cent) secured their degrees from coeducational colleges This increase of women students in coeducational colleges is not surprising, since in recent years some of the largest and oldest medical schools, as Columbia, Tulane, the University of Pennsylvania, Harvard and Western Reserve University, have thrown open their doors to women

NUMBER OF COLLEGES

Since June 30, 1919, one college the College of Physicians and Surgeons of the University of Southern California, was closed, and Fordham University School of Medicine was temporarily reopened, leaving 85 still existing Of these, 76 are nonsectarian (regular), 5 are homeopathic, 1 is eclectic and 3 are nondescript Two of the nondescript colleges are not recognized by the licensing board of Missouri the state in which they are located

2 Number and distribution of students are approximate number of graduates is exact
3 Distribution by classes is approximate totals are exact
4 Had only two classes will close June 1921

(Continued from page 383)

LENGTH OF TERMS

During the last twenty years there has been a decided lengthening of college terms This has reference to the weeks of actual work exclusive of holidays Prior to 1904 the majority of colleges had sessions of twenty-eight weeks or less For five years no colleges have had sessions shorter than twenty-nine weeks, and this year only one college reported a session as short as thirty weeks Sessions of from thirty-three to thirty-six weeks were reported by 67, or 78 9 per cent, of all colleges

TUITION AND OTHER FEES

Attention is called to Table 1, on pages 380-382, to the amount charged by the various medical colleges per annum for tuition, matriculation, laboratory and graduation fees for each student In Table 10, the eighty-five colleges have been grouped according to the amount of fees charged and according to their classification by the Council on Medical Education and Hospitals Twelve colleges charge fees of $100 or less per year, *thirty-four* between $100 and $175, thirty-one between $175 and $250, and eight charge above $250 Of the twelve colleges charging $100 or less, ten (83 per cent) are listed among Class A (acceptable) colleges[2] by the Council on Medical Education, while one each is in Class B and Class C The ten Class A colleges having these low fees are the schools of medicine of the state universities of Iowa, Missouri, Oklahoma, North Dakota, South Dakota, Texas and West Virginia—for residents of those states On the other hand, five colleges listed by the Council in Class C charge fees of from $100 to $175 per year for each student, and two exact fees of about $200 Diplomas from Class C colleges are reported as not recognized by from 37 to 42 state licensing boards[3] No intelligent student would knowingly spend his time and money in a low-grade college, the diplomas of which are not recognized by many states, when in the same time, and for even less money, he could attend one of the best-equipped colleges, the diplomas of which are recognized everywhere Although 45 colleges listed in Class A charge fees ranging from $150 to $350 per year for each student, the actual expense for teaching that student

2 See classification on p 395
3 See THE JOURNAL A M A April 17 1920 p 1092 Table D

for the year in these colleges is much more than the fee charged This larger expenditure is possible because the colleges receive either state aid or private endowment This shows that no medical college can properly teach medicine on the income received from fees alone

COLLEGES STUDENTS AND GRADUATES BY STATES

Illinois formerly had the largest number of medical colleges (Table 11), but for the last three years the first place has been held by New York where there are still nine colleges Illinois, Missouri and Pennsylvania have six colleges each, Massachusetts and Ohio have five each, and Tennessee has four Of Class C colleges, however, Missouri has three, Massachusetts has two, and there is one each in Illinois and Tennessee In Missouri the Class C colleges are not recognized by the local state licensing board and exist because that board does not have or does not exert the power to their charters revoked

For the last four years New York has had the largest number of students enrolled, this year having

275 to 300	2			2
300 or above	4			4
Totals	70	7	8	85

2,160, followed by Illinois with 1,690 and Pennsylvania with 1,456 New York leads also in the number of graduates, having reported 542 followed by Pennsylvania with 399, Illinois with 321, Missouri with 228, and Massachusetts with 215

QUALIFICATIONS OF STUDENTS AND GRADUATES

Table 12 shows the students and graduates of the last six years grouped according to their classification by the Council on Medical Education and Hospitals Note that during the eight years the *percentage* of students enrolled in Class A colleges has increased from 65 4 to 90 2, and that for the last four years also the total numbers of students in attendance at these schools has increased from 11,317 to 12,610 Note, on the other hand, both the numbers and the percentages of students enrolled in Class B and Class C colleges have been reduced The percentage of students in Class B colleges has been reduced from 24 4 to 4 1 and in Class C colleges from 10.2 to 4.2 Of graduates also, the percentage in Class A colleges shows an increase, while in Class B and Class C colleges there has been a decrease The reduction in the total number of students and graduates, therefore has been largely at the expense of the lower grade colleges while the numbers of students and graduates in the higher grade colleges are increasing

HINTS TO PROSPECTIVE MEDICAL STUDENTS

The student who is contemplating the study of medicine should read with care the instructions entitled "Choice of a Medical School" beginning on page 391 The selection of the school in which he is to obtain his

medical training is a matter of extreme importance and should be considered by the student with special care He should note the standards of premedical education which are given on page 393, he should note the subjects required by the individual medical schools which, if different from those outlined by the Council on Medical Education and Hospitals will be found in the descriptive statements of those colleges appearing on pages 398 to 408 A careful review of the material published this week will be a great service to such students

HOSPITALS FURNISHING ACCEPTABLE INTERNSHIPS

On pages 409 to 415 is published this year a list of hospitals which, after careful investigation, have been considered in position to furnish acceptable internships Although not previously published in THE JOURNAL, this list has already passed through several revisions The information from the hospitals has become more and more complete so that the lists are also more reliable

The present list includes 469 general hospitals, providing a total of 2,960 internships Included in the list, also, are 25 state and other hospitals for the insane which provide places for graduates who may desire to obtain special training in nervous and mental diseases There is also a list of 99 special hospitals providing internships for 388 students It is usual for those seeking internships in state or special hospitals to have first completed an internship in a general hospital The 469 general hospitals listed have a total of 103,997 beds The state hospitals have 41,722, and the special hospitals have 215,443, making a grand total of 361,162

This list also shows in the last column the hospitals which have nurses' training schools The fact that these institutions are approved for interns indicates that they also are fairly provided with nurses, which would indicate that they are also worthy of approval from the standpoint of nursing instruction

GRADUATE MEDICAL EDUCATION

The facilities for graduate medical instruction in the United States are set forth on the next few pages Not only are the separate graduate medical schools given, but also the opportunities available in undergraduate medical schools In the latter, the courses vary somewhat from year to year but the outlines given indicate the variety and extent of such work It is hoped that by the publication each year of these data opportunities in undergraduate schools may be enlarged and a greater use be made of the abundance of clinical material in this country The majority of undergraduate medical schools are now on a par with those in other leading countries, their future development need not be hindered by providing also for the giving of graduate courses

---

GRADUATE COURSES IN PUBLIC HEALTH

Graduate courses in public health have been established in connection with eleven medical schools, the first of which was at the University of Pennsylvania in 1909, the latest is that in connection with the medical department of the Johns Hopkins University which began its course in 1918 Two institutions, the University of Colorado and Tulane University, suspended their courses in 1918 Five of the schools have courses leading to the degree of Doctor of Public Health (Dr P H) after a two-year course The University of California offers the degree of Graduate in Public Health (Gr P H) after a two-year course instead of the degree of Dr P H The degree of Certified Sanitarian (C S) after a one-year course is offered by the University of Pennsylvania to graduates of colleges of arts and sciences The degree of Master of Public Health (M P H) is offered after a one-year course by the Detroit College of Medicine and Surgery and the University of Wisconsin Medical School The Master in Arts in Public Health [M A (P H)] is offered by the University of California Medical School, and the Master in Science in Public Health [M S (P H)] by the University of Michigan The courses offered by the eight schools of public health are as follows

THE UNIVERSITY OF CALIFORNIA Courses began in 1915 number of instructors, 20 three courses leading to degree of Gr P H (a) a four year course covering three years in the college of letters and science and one year in the medical school (b) a two year course covering one year in the college of letters and science and one year in the medical school for graduates of the college of civil engineering who have completed the work in sanitary engineering and (c) a course of one and a half years including one year in the college of letters and science and a half year in the medical school for students who have completed three and a half years of the medical course Completion of this third course gives the degrees of M D and Gr P H The University of California also offers a one year course to graduates in arts or sciences for the degree of Master in Arts in Public Health [M A (P H)] Fees are $150 each year A thesis is required for the degree The course extends from August to May Students 1919 1920 16 graduates 10

JOHNS HOPKINS MEDICAL SCHOOL The School of Hygiene and Public Health was opened in October 1918 There are 12 professors and 37 lecturers associates and instructors a total of 49 Four courses are offered (a) A two year course leading to the degree of Dr P H requiring for admission a bachelor's degree and a degree in medicine The degree of M D and the degree of Dr P H may be obtained in a combined course of five years A thesis is required for graduation (b) A three year course leading to the degree of Doctor of Science in Hygiene requiring for admission a bachelor's degree and adequate training in physics chemistry biology and the medical sciences anatomy physiology and pathology A written and oral examination and a dissertation embodying the results of an independent investigation are required for graduation (c) A two year course leading to the degree of Bachelor of Science in Hygiene the course consisting of combined work in the medical school and the School of Hygiene and Public Health For admission the applicant must have completed at least two years of work in an approved college and have studied courses in physics biology inorganic and organic chemistry (d) A one year course leading to a certificate in public health is also offered to graduates of approved medical schools or graduates in arts or sciences who present evidence of satisfactory training in the physical and medical sciences The fees charged are $250 per year Courses for special students are $50 per trimester Altogether 84 students were enrolled during 1919 1920 including 30 who were candidates for degrees The course extends from September 28 to June 21

MEDICAL SCHOOL OF HARVARD UNIVERSITY The School of Public Health was opened in 1910 there are 40 instructors A one year course is offered leading to a certificate in public health For admission the applicant must have completed two years of work in a recognized medical school or have received a bachelor's degree from an approved college or technical school or have had special experience in public health work In any instance he must show evidence of having completed satisfactory courses in physics chemistry and biology and modern languages and the fundamental medical sciences Although not a prerequisite all candidates are advised to obtain a medical degree before specializing in public health work Fees are $250 per year Course extends from October to June

DETROIT COLLEGE OF MEDICINE AND SURGERY The course began in 1913 with ten instructors A one year course leading to the degree of Master of Public Health (M P H) is offered to graduates of approved medical schools The work is conducted at the college the Detroit City Board of Health and the Municipal Contagious Hospital It includes sanitary engineering laboratory clinical and field work Fees are $100 per year No thesis required No students enrolled during the past session The course extends from September to June

THE UNIVERSITY OF MICHIGAN MEDICAL SCHOOL The graduate courses in public health were established in the University of Michigan in 1913 The number of instructors is approximately 10 Two courses are offered—one to graduates in arts and sciences or medicine extending from one to two years leading to the degree of Master in Science and Public Health the other a course of from two to three years in length for graduates in arts or sciences and medicine leading to the degree of Doctor of Public Health For residents of Michigan the fees consist of $10 matriculation and $80 for men students and $76 for women for nonresidents of Michigan matriculation $25 and an annual fee of $105 for men and $101 for women A thesis is required for the degree of Dr P H There is a summer session but the regular session extends from October 1 to July 1 In 1919 1920 4 students were enrolled

UNIVERSITY AND BELLEVUE HOSPITAL MEDICAL COLLEGE The graduate course in public health began in 1916 with approximately 30 teachers Two courses are offered—a two years course leading to the degree of Doctor of Public Health for graduates of approved medical schools and a correspondence course of indefinite length especially adapted for health officers The tuition for the Dr P H course is $200 for the first year and $25 for the second The fee for either the correspondence or 26 days resident course is $30 including the matriculation fee For the correspondence course the last week must be spent in residence There were 145 health officers reported as taking the correspondence course during the year The courses run from October to June

THE UNIVERSITY OF PENNSYLVANIA The graduate courses in public hygiene began in 1906 there are 19 instructors two courses are offered —a two years course for graduates in medicine leading to the degree of Dr P H and a one year course for graduates of arts or science leading to the degree of Certified Sanitarian A thesis is required for graduation The fees are $250 per year There were 8 students during 1919 1920 4 graduates The course extends from October to June

THE UNIVERSITY OF WISCONSIN Graduate courses in public health began in 1910 There are eight teachers Two courses are offered— a one year course for graduates in medicine leading to the degree of Master of Public Health (M P H) the other a two year course for physicians leading to the degree of Doctor of Public Health Fees are $50 per year for residents of Wisconsin and $170 for nonresidents A thesis is required for graduation Address inquiries to Miss Ruth Hames Secretary Medical School

Uniform Requirements in 1920-21

On February 28 1919, at a conference of representatives from a number of universities in the country held at New Haven Conn the following regulations were adopted to take effect with the Session 1920-21

1 That the degree of Doctor of Public Hygiene (for which the abbreviation shall be Dr P H) for graduates in medicine shall be awarded after two years of work done under academic direction, of which one year at least shall be in residence, and that the requirements for the degree shall include class work, practical field work and an essay based on individual study of a particular problem

2 That the degree Doctor of Philosophy or Doctor of Science in Public Hygiene shall be conferred on students who hold the bachelor's degree from a college or technical school of recognized standing and have satisfactorily completed not less than three years of graduate study It is understood that this degree is based on a knowledge of physics, chemistry, biology anatomy physiology, physiologic chemistry, pathology and bacteriology

GRADUATE COURSES IN MEDICAL SCHOOLS

Special correspondence with medical schools shows that there are many opportunities for graduate study which physicians have not been able to take advantage of through the lack of knowledge in regard to them The following list has been prepared to correct this deficiency More complete information can be obtained by correspondence with the medical school concerned

CALIFORNIA

LELAND STANFORD JUNIOR UNIVERSITY SCHOOL OF MEDICINE San Francisco —Graduate courses are open to physicians (a) Mid-day clinics 11 30 to 12 30 daily covering medicine medical specialties surgical specialties obstetrics gynecology and pathologic conferences free of charge (b) Clinical examinations at the Polyclinic of the San Francisco Hospital On Thursdays beginning 9 a m the work is in surgery and the surgical specialties on Fridays beginning 9 a m medicine and the medical specialties These courses are free of charge (c) Assistantships in clinics and laboratories A physician may be assigned to some research problem or receive regular instruction from a member of the staff For the latter an appropriate fee is charged and a nominal fee also for materials used During the last five years an average of 28 physicians each year has occupied these assistantships

UNIVERSITY OF CALIFORNIA MEDICAL SCHOOL —Resident positions are open to properly qualified medical graduates as follows In the University Hospital A resident position in general medicine and four assistant residentships one each in general medicine and dermatology in neuro psychiatry and infirmary in out patient department in medical research Besides a residentship in surgery there are five assistant residentships one each in general surgery urology orthopedic surgery ophthalmology ortorhinolaryngology out patient department and surgical pathology There are a residentship and two assistant residentships each in pediatrics and in obstetrics and gynecology There is one residentship each in pathology and in biochemistry and clinical laboratories In the San Francisco Hospital as house officers there are two positions in medicine and tuberculosis two in surgery one in pediatrics and isolation and one in obstetrics and gynecology Special courses to physicians and advanced students are open in the departments of anatomy (at Berkeley) neuro surgery pathology and research medicine An announcement regarding public health work appears in another column

COLORADO

UNIVERSITY OF COLORADO SCHOOL OF MEDICINE Boulder Denver — During the present summer courses for physicians were given in bacteriology biochemistry blood chemistry anatomy histology embryology clinical laboratory technic advanced pathology and ophthalmology The session extended from June 14 to August 28 divided in two terms Physicians may register for either term or for the entire quarter

ILLINOIS

RUSH MEDICAL COLLEGE Chicago —The following courses are offered for physicians (a) Operative surgery on the cadaver extending over four weeks (b) A course on tuberculosis (c) Special course for three or four physicians who are willing to spend a full year in diseases of the ear nose and throat (d) Attendance at arena clinics for which a visitor's ticket for a week is issued—registration not limited (e) Opportunities for a few physicians for investigative work in pathology Fees $25 for each major's work or $75 for a full quarter

UNIVERSITY OF ILLINOIS COLLEGE OF MEDICINE Chicago — The summer quarter is devoted to courses for physicians and during the balance of the year a large number of fellowships are available in courses leading to the degrees of Master of Science and Doctor of Philosophy A well organized course in ophthalmology has been established Special opportunities for individual research work in anatomy pharmacology and pathology and bacteriology were offered during the present summer quarter

MICHAEL REESE HOSPITAL Chicago —There are five Fellowships one each respectively in medicine surgery and gynecology eye ear nose and throat pediatrics and genito urinary diseases The five Fellowships are open to physicians who have completed internships in acceptable hospitals preference is given to former interns of this hospital The work includes daily service in dispensary clinics and a limited number of visits to the sick in their homes The time devoted is about six half days per week These Fellowships provide excellent clinical training and offer opportunity also for special research work The Fellowships include an annual stipend of $900 each

INDIANA

INDIANA UNIVERSITY SCHOOL OF MEDICINE Indianapolis — Opportunities for any physicians resident in the state who make application During the present summer courses on immunity and on disease production and resistance were offered Other courses will be arranged as requested so far as facilities will allow

IOWA

STATE UNIVERSITY OF IOWA COLLEGE OF MEDICINE Iowa City — During the present summer a four weeks review course limited to 14 physicians was offered There are opportunities for physicians to act as clinical assistants research workers hospital chemists etc in the various departments of the medical school Special opportunities are always open for physicians with research ability

MARYLAND

JOHNS HOPKINS UNIVERSITY MEDICAL DEPARTMENT Baltimore — During the present summer a six weeks course in medical diagnosis was offered limited to twenty physician The course consisted in ward round lectures clinics group courses physical diagnosis laboratory work in clinical microscopy and group clinics in the special study of syphilis Provision can be made for similar classes in the other main departments of the medical college Opportunities for advanced work open to a certain number of qualified men The work is arranged for by personal communication between the applicants and the heads of the various departments Special opportunities for long time service in the hospital

UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE Baltimore — Courses are open for physicians in operative surgery anatomy obstetrics genito urinary diseases roentgen ray and clinical laboratory work Arrangements made by personal communication

MICHIGAN

UNIVERSITY OF MICHIGAN MEDICAL SCHOOL Ann Arbor — Special courses open for any qualified physicians in laboratory or clinical work regional anatomy as a preparation for medical specialties also special methods and investigative work in bacteriology Extended courses also offered leading to the degrees of Master of Science Doctor of Philosophy and Doctor of Science Summer courses are open for advanced work in research anatomy and bacteriology

MISSOURI

WASHINGTON UNIVERSITY MEDICAL SCHOOL St Louis —A series of courses are open for physicians in the Barnes and City Hospitals and in the outpatient department and clinical laboratory of the medical college The physician may devote all or a part of his time in the wards dispensary or in the laboratory The courses extend over four weeks during the summer session Maximum fees are $50 for a half day or $100 for the entire day During the present summer courses were offered in physical and differential diagnosis clinical chemistry and microscopy tuberculosis dermatology and syphilis diseases of metabolism applied immunology mental dificiency and cardiovascular renal diseases In several of these subjects the courses included clinical subjects lectures ward round instruction in diagnostic methods application of laboratory tests and in mental diseases interpretation of intelligence tests Special courses are given in pediatrics Courses arranged by individual communication

NEBRASKA

UNIVERSITY OF NEBRASKA COLLEGE OF MEDICINE Omaha —Opportunities for a few physicians to do graduate work in the departments of anatomy physiology biochemistry pathology and bacteriology A few opportunities open also in the clinical department

NEW YORK

COLUMBIA UNIVERSITY COLLEGE OF PHYSICIANS AND SURGEONS New York City — Courses for physicians are being arranged which will become available in the fall of 1920

LONG ISLAND COLLEGE HOSPITAL Brooklyn —Positions comparable to fellowships open for physicians who have completed internships These are in several clinical departments of the hospital Courses open in fundamental branches courses also open in embryology neuro anatomy histology bacteriology biochemistry physiology preventive medicine and hygiene Also opportunities for research work in biochemistry and physiology Special courses on animal locomotion heart and circulation and functional diseases Opportunities also for physicians to do advanced work Arrangements made by personal communication

UNIVERSITY AND BELLEVUE HOSPITAL COLLEGE OF MEDICINE —Various graduate courses are open for physicians as follows Research courses in anatomy embryology chemistry physiology pharmacology and therapeutics as well as special courses in pathology bacteriology and surgery Clinical courses occupying about six weeks each are also offered in medicine and physical diagnosis clinical and operative gynecology genito urinary diseases laryngology ophthalmology pediatrics and dermatology

OHIO

WESTERN RESERVE UNIVERSITY SCHOOL OF MEDICINE Cleveland — The summer session is devoted especially to courses for physicians Courses also available during the remainder of the year especially for physicians desiring advanced research work either in clinical or laboratory subject Arrangements by personal communication

VIRGINIA

MEDICAL COLLEGE OF VIRGINIA Richmond —Opportunities open for a few physicians to take courses in the combined laboratories of the college of the State Board of Health and of the Richmond City Board of Health

ONTARIO

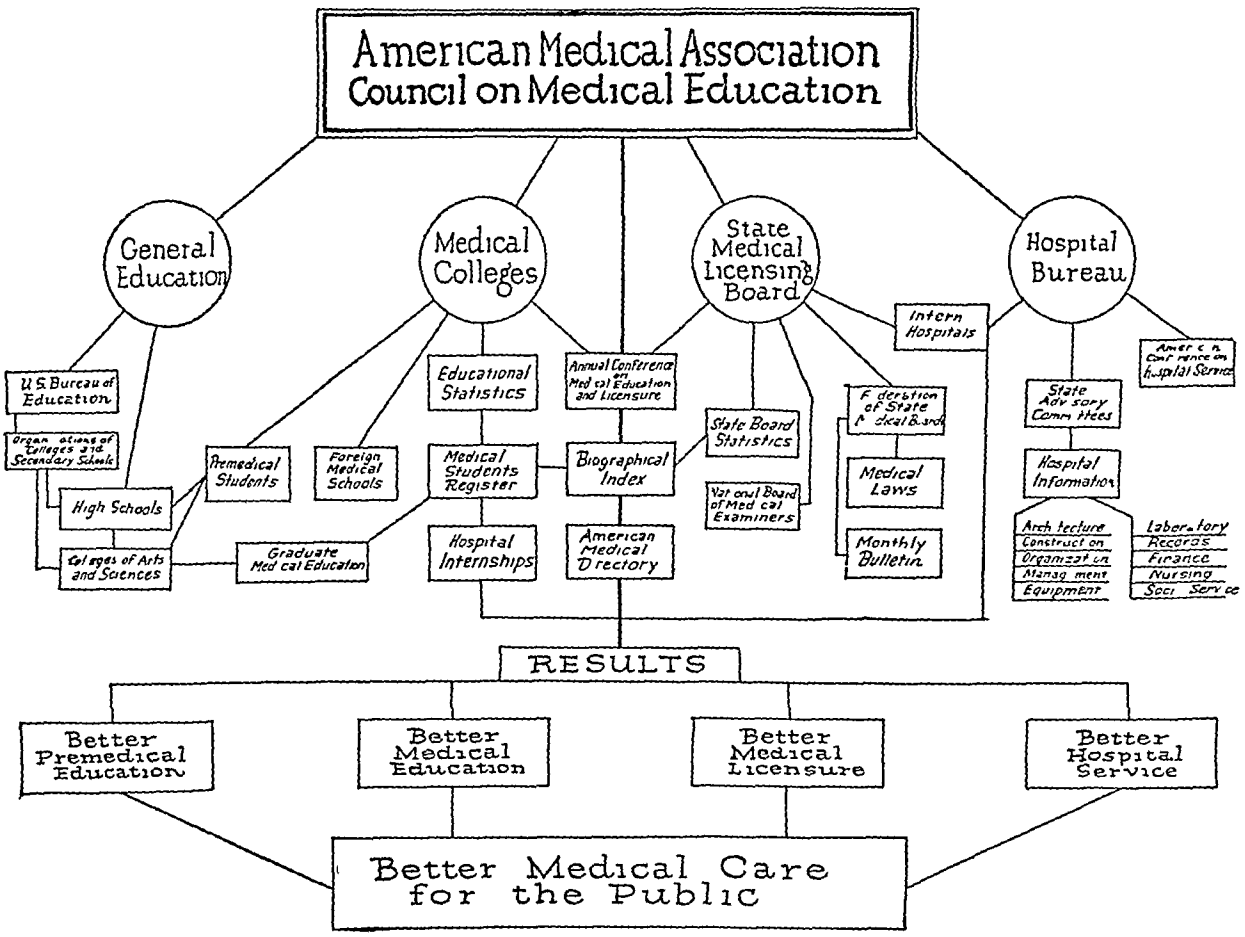
UNIVERSITY OF TORONTO FACULTY OF MEDICINE, Toronto —Graduate courses in clinical and laboratory work are available to physicians on application During the present summer session a special course in pediatrics was offered Also a series of lectures were prepared and given before medical societies or other groups of physicians in the country district The courses dealt with biochemistry [illegible] medicine pediatrics obstetrics and gynecology [illegible] pharmacology physiology and respiration of the [illegible]

GRADUATE MEDICAL SCHOOLS

There are now eighteen graduate medical schools in the United States These are commonly referred to as post-graduate medical schools Of these institutions, seven are connected with universities in which the graduate teaching is, or will be, as thoroughly and scientifically given as are the courses of the undergraduate medical school The universities having graduate schools are the Universities of Alabama, California, Tulane, Harvard, Minnesota Columbia and Pennsylvania The University of Chicago has received a generous endowment preparatory to the establishing of a large graduate school Active steps toward this end will be taken in the the early future Following is the complete list of the graduate medical schools

ALABAMA

GRADUATE SCHOOL OF MEDICINE OF THE UNIVERSITY OF ALABAMA Ave F and 20th St Birmingham Organized 1915 Formerly the Birmingham Medical College Suspended in 1918 reopens in fall of 1920 The dean is Dr Lewis C Morris, Empire Bldg



Reproduction of a chart from the exhibit of the Council on Medical Education and Hospitals at the session of the American Medical Association in New Orleans April 26 30 It shows the many ramifications of the work of the Council on Medical Education by which the latter has come into intimate touch with other departments of education with medical licensure and with hospitals

CALIFORNIA

SAN FRANCISCO POLYCLINIC AND POST GRADUATE SCHOOL 1535 Jackson St San Francisco The dean is Dr H D Arcy Power

GRADUATE SCHOOL OF MEDICINE OF THE UNIVERSITY OF CALIFORNIA Buena Vista and Alpine Sts Los Angeles Organized 1914 Formerly the University of Southern California College of Medicine The dean is Dr George H Kress

ILLINOIS

CHICAGO POLICLINIC 219 221 W Chicago Ave Chicago The secreary is Dr Malcolm L Harris 32 N State St

ILLINOIS POST GRADUATE MEDICAL SCHOOL 1844 W Harrison St Chicago The secretary is Dr James A Clark

POST GRADUATE MEDICAL SCHOOL 2400 Dearborn St Chicago The secretary is Dr Emil Ries 77 E Washington St

CHICAGO EYE EAR NOSE AND THROAT COLLEGE 235 W Washington St Chicago The secretary is Dr John R Hoffman 31 N State St

PROVIDENT HOSPITAL POST GRADUATE SCHOOL 16 W 36th St Chicago For colored physicians The dean is Dr George C Hall

LOUISIANA

NEW ORLEANS POLYCLINIC Post Graduate School of Medicine of the Tulane University of Louisiana Tulane Ave and Liberty St, New Orleans The dean is Dr Charles L Chassaignac

NEW ORLEANS POST GRADUATE SCHOOL OF MEDICINE 135 S Rampart St New Orleans The secretary is Dr Joseph A Danna

MASSACHUSETTS

HARVARD MEDICAL SCHOOL COURSES FOR GRADUATES, 240 Longwood Ave Boston Organized as a separate division of the Medical School 1912 all instruction under the charge of the Faculty of Medicine Instruction is given throughout the year The officer in charge is the assistant dean Alexander S Begg M D

MINNESOTA

UNIVERSITY OF MINNESOTA GRADUATE SCHOOL OF MEDICINE Minneapolis Organized 1914 In 1915, the resources and facilities of the Mayo Foundation were added with the staff clinics laboratories library and records at Rochester Minn A nine months course of advanced work is offered in the science departments giving the fundamental training essential in ophthalmology and otolaryngology will begin Sept 29 1920 It will include anatomy embryology and histology of the sense organs and of the head region, physiologic optics physiology of the special senses and of speech pathology and bacteriology as applied to the eye ear nose and throat The course will include lectures demonstrations quizzes and clinical work in the outpatient department The course is limited to ten students There are also two teaching fellowships each available in internal medicine surgery obstetrics ophthalmology and otolaryngology pediatrics, and mental and nervous diseases Five others are available in the laboratory sciences and eighty six others are available under the Mayo Foundation Courses in various specialties leading to higher degrees in medicine (M A M S PH D) Instruction throughout the year The dean is Guy Stanton Ford PH D Minneapolis

NEW YORK

The New York Association for Medical Education is organized to collect information regarding available graduate medical instruction to work for the improvement of existing courses and the establishment and development of new opportunities for advanced study to bring about an affiliation between medical schools and hospitals whose facilities have not before been utilized for teaching purposes and to serve as a bureau of information and assistance to prospective students The executive offices are at the Academy of Medicine Bldg 17 W 43d St New York The graduate schools are as follows

NEW YORK POST GRADUATE MEDICAL SCHOOL 2d Ave and 20th St New York City The secretary is Dr J Bentley Squier

NEW YORK POLYCLINIC MEDICAL SCHOOL 341 51 W 50th St, New York City Is to be taken over and the work developed by Columbia University The president is Dr John A Wyeth 341 W 50th St

MANHATTAN EYE EAR AND THROAT HOSPITAL AND MEDICAL SCHOOL 210 E 64th St New York City The secretary is Dr Samuel J Kopetzky

SCHOOL OF OPHTHALMOLOGY AND OTOLOGY 13th St and 2d Ave New York City The secretary is Dr George S Rixon 40 E 41st St

COLLEGE OF THE NEW YORK OPHTHALMIC HOSPITAL 23d St and Third Ave New York City The secretary is Dr W C McKnight 13 Central Park West

PENNSYLVANIA

GRADUATE SCHOOL OF MEDICINE OF THE UNIVERSITY OF PENNSYLVANIA Philadelphia Organized 1916 by a merger with the University of the Medico Chirurgical College of Philadelphia The Philadelphia Polyclinic was merged in 1918 The faculty includes about 230 teachers Courses extending over from four to twelve months in medicine pediatrics neurology dermatology syphilology roentgenology surgery gynecology obstetrics orthopedics urology proctology ophthalmology otolaryngology and the medical sciences Fees Four month courses $200 eight month $400 twelve month $600 Special schedules (few only) special fees The dean is Dr George H Meeker

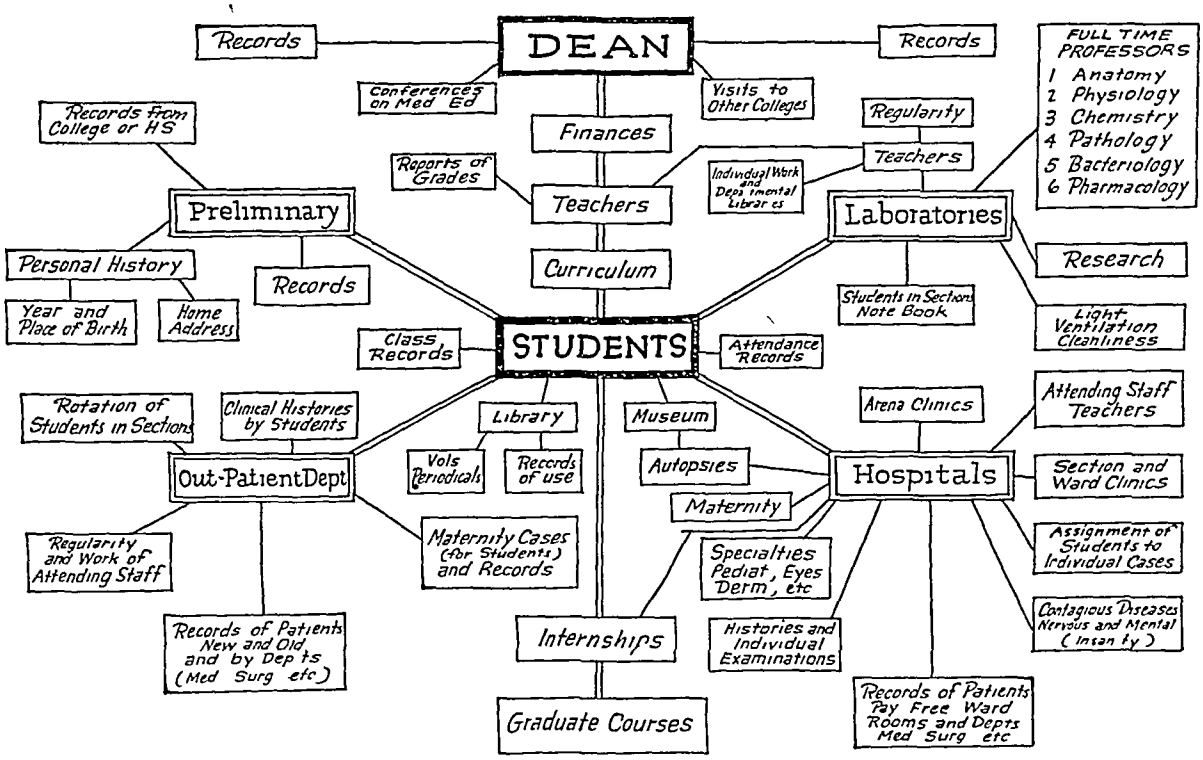
CHOICE OF A MEDICAL SCHOOL

For the student who has decided to study medicine the first and most important step is the selection of a medical school, a false step here may handicap him for life thirty-three states he may later miss a great opportunity by being thus debarred He should know also that all the better medical colleges now require this higher preliminary education since—most important of all—the student needs it to study and understand the difficult and complex subjects of the modern medical course Lower entrance requirements by any medical college therefore should be regarded as an indication that the medical training furnished will be correspondingly low

BETTER MEDICAL TRAINING ESSENTIAL

Medicine is now based on scientific knowledge, without which the physician will be seriously handicapped Adequate instruction in the recognition, treatment and prevention of diseases can be given only in acceptable (Class A) medical schools, which have expert teachers well-equipped laboratories and dispensaries and hospitals where the student can study patients having all varieties of sickness and injuries

A MODERN MEDICAL SCHOOL



Reproduction of a chart from the exhibit of the Council on Medical Education and Hospitals at the session of the American Medical Association in New Orleans April 26 30 It gives some idea of the intricate mechanism of a modern medical school it shows the many inter relations of the medical school with its laboratories hospitals and dispensaries and the many lines of work with which the dean or executive officer of the medical school needs to keep in intimate touch

Before choosing a medical school the student should obtain information in regard to its requirements of preliminary education, the character of its teaching its classification, the tuition fees charged and—most important—whether or not its diplomas are recognized by all state medical boards

ADEQUATE ENTRANCE QUALIFICATIONS

The student should make sure that his preliminary education is sufficient to meet the requirements of the state licensing boards of the country He should know that at the present time thirty-four[1] (69 4 per cent) state licensing boards require that before beginning the study of medicine the student must have completed *two years* of work in an approved college of liberal arts, in addition to a four-year high school education Although he may not at first seek a license in one of these

IS THE MEDICAL COLLEGE RECOGNIZED?

Formerly a course in almost any medical college furnished an adequate qualification for the license to practice medicine in all states At present however, state licensing boards are refusing to recognize medical colleges which are deemed not properly equipped to furnish a training in modern medicine The student should know that the diplomas granted by some medical schools are not recognized in as high as from 37 to 2 states[2] A diploma from one of these medical colleges therefore would not qualify him to practice medicine in any of those states The student must make sure not only that he has adequate preliminary education but also that he has secured his medical training in a college recognized in all states

CONSIDER CAREFULLY THE COST

The student of course is bound to consider the expense of his medical training and herein lies the basis

1 These states may be noted in Table L THE JOURNAL April 17 1920 p 1099

2 The courses required and recommended in the high school and two year premedical college courses are set forth on page 393

3 See Table D THE JOURNAL April 17 1920 p 10

some inferior colleges which profess deep interest in "the poor boy" endeavor to attract students If the training is not thorough and up to date, the student should know that the training furnished will be a mighty poor investment at any price As a matter of fact, and as may be noted in Table 1, on page 380, the total fees charged by some of the best (Class A) medical colleges, particularly the medical departments of some state universities, are lower than those charged by some of the poorly equipped (Class C) institutions which are not recognized by the majority of state licensing boards

In the same length of time therefore, and often for even lower fees than he would pay in a poorly equipped institution, the student may acquire his education in one of the best medical colleges of the land Although some of the better schools do charge higher fees they spend on each student per year several times the amount of money that the student pays for tuition This they are able to do because of their larger incomes from endowments or state aid It would be poor economy, therefore, for a student to enter a low-grade college whose diplomas are not recognized in the majority of states, when for a few additional dollars each year he can enter a thoroughly equipped institution, receive a far better medical training and obtain a diploma recognized everywhere Even if one should be required to work one s way through in whole or in part the opportunities for doing so are usually more abundant in the better than in the lower standard colleges As a rule however, the student who works his way through college appreciates not only the value of money but also the value of the medical course he is getting and many such students are found in the high-grade medical colleges There are now over 300 free scholarships as well as generous loan funds, available for deserving students in the better medical colleges [4]

GET RELIABLE INFORMATION

How may the student secure reliable information on these matters? Some medical colleges advertise extensively in newspapers and popular magazines and through announcements and circulars containing exaggerated if not misleading, statements *Of course, such advertisements do not show the more important fact that their diplomas are reported as not recognized in from 37 to 42 states* It is essential therefore, that the student should secure information from impartial and reliable sources so as to make sure he is not enticed into a low-grade institution To inform himself thoroughly therefore, he should not depend alone on the announcements of the medical schools After extensive and repeated investigations the medical schools of the country have been rated by the Council in three classes, namely, A, B and C, according to their degree of excellence [5] If the student is otherwise in doubt, he will not make a mistake by choosing one of the colleges in Class A By so doing he will not only obtain a better training in medicine but also after graduation, will be eligible to secure a license in any state he may choose

A STRONG AND SURE FOUNDATION

In his preliminary and medical education the student should bear in mind that he is *laying the foundation for the rest of his life* If he finds that additional preliminary education is needed to enter one of the better medical colleges, he should consider the time well spent since he is all the more sure of having laid a solid foundation Although all professions in this country are crowded there is always room for the thoroughly competent On the other hand the student will be disappointed if because of lower entrance requirements or other allurements he is induced to get his training in a poorly equipped college and finds after graduation that his diploma is not recognized in many states, and that otherwise he is handicapped for life

AVOID CULTS AND FADS

Among the worst pitfalls confronting the present day student is the number of institutions representing various unscientific or pseudo-scientific cults, such as osteopathy, chiropractic, etc, which profess to train those who desire to treat human ailments Medical knowledge is now based on scientific facts and there is no longer room for the differences of opinion which in earlier days were justifiable No one can afford to confine his training to the narrow theories held by any cult but should obtain a thorough all-round scientific training by which he will be prepared to care intelligently for any form of human ailment or disorder which presents itself and to apply skilfully any form of treatment which each particular patient may require One must have a thorough training in *all the fundamentals of medicine* before he can intelligently employ any particular method of treatment, even as the member of an orchestra must have a thorough training in all the fundamentals of music before he can play any particular instrument in that orchestra One must first become a good general practitioner of medicine, then if he wishes to specialize along any particular line he will naturally secure further training for such specialty

4 A list of colleges which provide scholarships and loan funds will be found on page 398

5 See classification on page 395

STANDARDS OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

SCHEDULE FOR GRADING MEDICAL SCHOOLS

Schools are rated on a civil service basis on a scale of 100 points Data relating to each school will be grouped under four general heads in such manner that the groups will have as nearly equal importance as possible, each group being allowed a possible 25 points The revised schedule under the four general heads is as follows

1 FACULTY —Number qualifications (standing in profession evidences of special training teaching experience etc), research ability efficiency proportion of time to teaching proportion to student enrolment organization of departments completeness of department staffs including dieners employees etc, esprit de corps

2 PRODUCT —Qualifications of students admitted student organizations esprit de corps records of graduates before state and national boards research articles written excellence as teachers membership in medical organizations reputation in profession other evidences of character of training reputation of college

3 ADMINISTRATION AND SUPERVISION —Curriculum grade of course sequence of subjects arrangement of subjects in class roster and by departments in annual announcements completeness of curriculum Division of students in sections ward classes etc Efficiency of routine Faculty meetings Supervision of entrance requirements of teaching in college and in dispensary and hospital Records entrance requirements class grades promotion of students dispensary and hospital records attendance of teachers and students conditions etc completeness Budget use made of funds proportion to salaries etc

4 BUILDINGS AND EQUIPMENT —College building including class rooms laboratories library museum storage rooms animal houses and their contents Dispensary rooms used for accessibility number and regularity of staff quantity and use of clinical material character of histories and records Hospital accessibility ownership or control quantity variety and use of clinical material Other equipment Apparatus Funds in addition to students fees, endowed chairs fellowships etc

Colleges obtaining 70 per cent or above are rated in Class A, those obtaining from 50 to 70 per cent in Class B, and those obtaining 50 per cent or less in Class C

MEANING OF CLASSES A, B AND C

Class A Colleges are those which are acceptable, Class B those which under their present organization, give promise of being made acceptable by general improvements, and Class C those

(*a*) Which require a complete reorganization to make them acceptable

(*b*) Which do not keep satisfactory records of their students in regard to entrance requirements, attendance, grades in courses division into classes and reasons for promotion

(*c*) Which do not enforce their requirements in regard to admission (including those admitted to advanced standing), promotion and graduation

(*d*) Which give the major portion of their instruction after 4 o clock in the afternoon

(*e*) Which are privately owned and conducted for profit

(*f*) Which for other specific reasons are not eligible for inclusion in Class B

ESSENTIALS OF AN ACCEPTABLE MEDICAL COLLEGE

Revised to Aug 1, 1920

1 The minimum requirement for admission to an acceptable medical college is a four-year high school education or its full equivalent and two years of work in a college of arts and sciences approved by the Council on Medical Education and Hospitals, as follows

1 High School Requirements

(*a*) For admission to the two-year premedical college course, students shall have completed a four-year course of at least fifteen units in a standard accredited high school or other institution of standard secondary school grade or have the equivalent as demonstrated by examinations conducted by the College Entrance Examination Board or by the authorized examiner of a standard college or university approved by the Council on Medical Education and Hospitals. A detailed statement of attendance at the secondary school and a transcript of the student's work, should be kept on file by the college authorities. This evidence of actual attendance at the secondary schools should be obtained no matter whether the student is admitted to the freshman or to higher classes.

(*b*) Credits for admission to the premedical college course may be granted for the subjects shown in the following list and for any other subject counted by a standard accredited high school as a part of the requirements for its diploma provided that at least eleven units must be offered in Groups I-V.

SCHEDULE OF SUBJECTS REQUIRED OR ACCEPTED FOR ENTRANCE TO THE PREMEDICAL COLLEGE COURSE

Subjects	Units*	Required
GROUP I ENGLISH—		
Literature and composition	3 4	3
GROUP II FOREIGN LANGUAGES—		
Latin	1 4	
Greek	1 3	
French or German	1 4	2†
Other foreign languages	1-4	
GROUP III MATHEMATICS—		
Elementary algebra	1	*
Advanced algebra	½ 1	
Plane geometry	1	1
Solid geometry	½	
Trigonometry	½	
GROUP IV HISTORY—		
Ancient history	½ 1	
Medieval and modern history	½ 1	
English history	½ 1	1
American history	½ 1	
Civil government	½ 1	
GROUP V SCIENCE—		
Botany	½ 1	
Zoology	½ 1	
Chemistry	1	
Physics	1	
Physiography	½ 1	
Physiology	½ 1	
Astronomy	½	
Geology	½ 1	
GROUP VI MISCELLANEOUS—		
Agriculture	1 2	
Bookkeeping	½ 1	
Business law	½	
Commercial geography	½ 1	
Domestic science	1 2	
Drawing freehand and mechanical	½ 2	
Economics and economic history	½ 1	
Manual training	1 2	
Music Appreciation or harmony	1 2	

* A unit is the credit value of at least thirty six weeks work of four or five recitation periods per week each recitation period to be not less than forty minutes. In other words a unit represents a year's study in any subject in a secondary chool constituting approximately a quarter of a full year's work. A satisfactory year's work in any subject cannot be accomplished under ordinary circumstances in less than 120 sixty minute hours or their equivalent.

† Both of the required units of foreign language must be of the same language but the two units may be presented in any one of the languages specified.

Of the fifteen units of high school work eight units are required as indicated in the foregoing chedule the balance may be made up from any of the other subjects in the chedule

2 Premedical College Course

(*c*) The minimum requirement for admission to acceptable medical schools, in addition to the high school work specified above, is sixty semester hours of collegiate work in a college approved[7] by the Council on Medical Education and Hospitals. The subjects included in the two years of college work should be in accordance with the following schedule

SCHEDULE OF SUBJECTS OF THE TWO YEAR PREMEDICAL COLLEGE COURSE

Sixty Semester Hours* Required	Semester Hours
Required Subjects	
Chemistry (a)	12
Physics (b)	8
Biology (c)	8
English composition and literature (d)	6
Other non cience subjects (e)	12
Subjects Strongly Urged	
A modern foreign language (f)	6 12
Advanced botany or advanced zoology	3 6
Psychology	3 6
Advanced mathematics including algebra and trigonometry	3 6
Additional courses in chemistry	3 6
Other Suggested Electives	
English (additional) economics history sociology political science logic mathematics Latin Greek drawing	

* A semester hour is the credit value of sixteen weeks work consisting of one lecture or recitation period per week each period to be not less than fifty minutes net at least two hours of laboratory work to be considered as the equivalent of one lecture or recitation period

SUGGESTIONS REGARDING INDIVIDUAL SUBJECTS

(*a*) *Chemistry*—Twelve semester hours required of which at least eight semester hours must be in general inorganic chemistry including four semester hours of laboratory work. In the interpretation of this rule work in qualitative analysis may be counted as general inorganic chemistry. The remaining four semester hours may consist of additional work in general chemistry or of work in analytic or organic chemistry. After Jan 1 1922 organic chemistry will be required.

(*b*) *Physics*—Eight semester hours required, of which at least two must be laboratory work. It is urged that this course be preceded by a course in trigonometry.

(*c*) *Biology*—Eight semester hours required, of which four must consist of laboratory work. The requirement may be satisfied by a course of eight semester hours in either general biology or zoology or by courses of four semester hours each in zoology and botany but not by botany alone.

(*d*) *English Composition and Literature*—The usual introductory college course of six semester hours, or its equivalent is required.

(*e*) *Nonscience Subjects*—Of the sixty semester hours required as the measurement of two years of college work at least eighteen including the six semester hours of English should be in subjects other than the physical, chemical or biologic sciences.

(*f*) *Foreign Language*—A reading knowledge of a modern foreign language is strongly urged. French and German have the closest bearing on modern medical literature. If the reading knowledge in one of these languages is obtained on the basis of high school work, the student is urged to take the other language in his college course. It is not considered advisable however, to spend more than twelve of the required sixty semester hours on foreign languages.

Recognition—This two year premedical course in both quantity and quality must be such as to make it acceptable as the equivalent of the first two years of the course in reputable approved colleges of arts and sciences leading to the degree of Bachelor of Science.

3 Approved Colleges of Arts and Sciences

A tentative list of colleges of arts and sciences approved by the Council on Medical Education and Hospitals has been prepared and will be occasionally revised. By an approved college (of arts and sciences) is meant one whose standing has been vouched for by some standardizing agency in whose methods the Council has confidence. To be recognized a college must have sufficient scientific equipment and maintain laboratories in the premedical sciences. It must have ample endowment to maintain a sufficient corps of teachers. Membership in some national organization or association of colleges will be favorably regarded and in the absence of such membership careful investigation will be made of the causes of exclusion. It must maintain national standards for admis

7 A tentative list of approved colleges may be obtained cation to the American Medical Association enclosing 6 c

sion to its freshman class Undue liberality in the acceptance of certificates from secondary schools unendorsed by approved standardizing agencies will be registered by the Council as a failure to comply with its requirement and the college will be dropped from the approved list No college will be approved by the Council which allows work *in absentia* or by correspondence courses to count toward a baccalaureate degree

PREMEDICAL COURSES IN MEDICAL COLLEGES—JUNIOR COLLEGES

Premedcal college courses given in or by medical schools, by normal schools, or advance years taken in high schools, will not be considered as acceptable unless they have been investigated and approved by some association of colleges and secondary schools or other approved agency having to do with the standardizing of liberal arts colleges and unless they are found to be a full equivalent of the first two years of the course leading to the Bachelor of Science degree

4 The Medical School

ADMINISTRATION OF ENTRANCE REQUIREMENTS

2 The admission of students to the medical school must be in the hands of a responsible committee or examiner whose records shall always be open for inspection Documentary evidence of the student's preliminary education should be obtained and kept on file When the medical school is an integral part of the university, this work usually devolves on the university examiner Unless the university examiner and his records are closely accessible, however some officer at the medical school should obtain and keep on file documentary evidence of each student's preliminary education, including both high school and collegiate work The records should show especially that the required amount of work in the premedical sciences, including laboratory experiments, has been completed

OTHER MEDICAL SCHOOL REQUIREMENTS

3 The college should require that students be in actual attendance in the college *within the first week* of each annual session and thereafter

4 Actual attendance at classes should be insisted on except for good cause, such as for sickness, and no credit should be given for any course where the attendance has been less than 80 per cent of the full time

5 (*a*) Full advanced standing may be granted to students only for work done in other acceptable medical schools and in granting advanced standing there should be no discrimination against the college's full-course students Official verification of the student's previous medical work should be obtained by direct correspondence with the college previously attended and his preliminary qualifications should also be verified and recorded the same as for freshman students (*b*) In *exceptional cases* students who possess the required premedical qualifications and who have completed three or more years of work in Class B medical schools may be given advanced standing but not higher than *entrance* to the third year (junior) class and no credit should be given in any subject except on recommendation of the head of the department teaching that subject (*c*) In *exceptional cases* also students who possess the required premedical qualifications and who have completed three or more years of work in Class C colleges may be given advanced standing but not higher than *entrance* to the second year (sophomore) class and then only after thorough examinations in all first year subjects have been passed

SUPERVISION, EQUIPMENT TEACHERS

6 There should be careful and intelligent supervision of the entire school by the dean or other executive officer who holds and has sufficient authority to carry out fair ideals of medical education as determined by the present day knowledge of medicine

7 There should be a good system of records showing conveniently and in detail the credentials attendance grades and accounts of the students by means of which an exact knowledge can be obtained regarding each student's work Records should also be kept showing readily the attendance of patients at the teaching hospitals and dispensaries, the maternity cases attended by students, and the postmortem cases used in teaching

8 The college curriculum should be fully graded and should cover four sessions of at least thirty-two weeks each, exclusive of time required for matriculation and holidays and at least thirty hours per week of actual work The courses offered in the various subjects should be set forth by departments (anatomy physiology, etc) in the annual announcement, showing for each course its number, subject, content, character (lecture, recitation, laboratory or clinic), length of time when where, and by whom given and the amount of credit allowed The courses for each class should also be clearly set forth in a printed class schedule, for the guidance of the students

(*a*) The college should give two years of work consisting largely of laboratory work in well equipped laboratories of anatomy histology, embryology physiology physiologic chemistry bacteriology pathology, pharmacology therapeutics and clinical diagnosis Present-day medical knowledge makes it essential that these subjects be in charge of full-time, well-trained teachers

(*b*) Two years of clinical work largely in hospitals and dispensaries, with courses in medicine (including physical diagnosis pediatrics nervous and mental diseases), surgery (including surgical anatomy and operative surgery on the cadaver) obstetrics gynecology laryngology, rhinology, ophthalmology otology dermatology, hygiene and medical jurisprudence With the higher entrance requirements time is now available in the latter part of the second year for beginning courses in physical diagnosis and the principles of surgery

(*c*) As soon as conditions warrant, relations should be established with a number of approved hospitals so that a fifth undergraduate year may be required to be spent by the student as an intern under the continued supervision of the medical school

FACULTY

9 (*a*) The college should provide at least *eight expert thoroughly trained professors in the laboratory branches,* salaried so that they may devote their entire time to instruction and to that research without which they cannot well keep up with the rapid progress being made in their subjects[8] For colleges having *sixty students or less* in each class, there should be at least one full-time salaried assistant each in the departments of (1) anatomy (2) physiology (3) pathology and bacteriology and (4) physiologic chemistry and pharmacology There should be also one additional assistant provided in each of these departments for *each additional thirty students enrolled* This represents a low average of the full-time assistants already employed by the acceptable medical colleges

(*b*) The faculty should be made up of graduates of institutions recognized as medical colleges and who have had a training in all departments of medicine Nonmedical men should be selected as teachers in medical schools only under exceptional circumstances and only when medical men of equal special capacity are not available The faculty should be organized each department having its head professor, its associate professor assistant professor, instructor etc each having his particular subjects for the teaching of which he is responsible to the head of the department

CLINICAL FACILITIES AND INSTRUCTION

10 (*a*) The college should own or entirely control a hospital in order that students may come into close and extended contract with patients under the supervision of the attending staff This hospital should be in close proximity to the college and have a daily average (for senior classes of 100 stu-

8 These professors should have a definite responsibility in the conduct of the college and their first and chief interest should be the training of medical tudents It is suggested that four of these professors be placed at the head of the departments of (*a*) anatomy (*b*) physiology and physiologic chemistry (*c*) pathology and bacteriology and (*d*) pharmacology and therapeutics The other four might with advantage be a signed one each to (*e*) histology and embryology under the department of anatomy and to the department of (*f*) pathology and bacteriology and (*g*) physiology and pharmacology and to the departments of (*h*) either internal medicine or surgery

dents or *less*) of not less than 200 patients who can be utilized for clinical teaching, these patients to be of such character as to permit the students to see and study the common variety of surgical and medical cases as well as a fair number in each of the so-called specialties In the use of this material *bedside and ward clinics* should be developed for sections of from five to ten students and for the seniors, a certain number of patients in medicine, surgery and the specialties should be assigned to each student under a well supervised clinical clerk system The treatment and care of these patients should be particularly observed and recorded by the student under the strict supervision of the intern or the attending staff of the hospital

(*b*) The college should also have ample hospital facilities for children's diseases, contagious diseases and nervous and mental diseases

(*c*) The college should own or control a dispensary, or outpatient department the attendance to be a daily average of 100 patients (visits) (for senior classes of 100 students *or less*), the patients to be carefully classified, good histories and records of the patients to be kept and the material to be well used The attending staff should be made up of good teachers should be well organized and be prompt and regular in attendance

(*d*) At least six maternity cases should be provided for each senior student who should have actual charge of these cases under the supervision of the attending physician Careful records of each case should be handed in by the student

(*e*) Facilities should be provided for at least thirty necropsies (for senior classes of 100 students *or less*) during each college session which are attended and participated in by senior students These as a rule, should be in the teaching hospital controlled by the medical school and performed by the professor of pathology The so-called clinical-pathologic conferences should be more widely developed in connection with the postmortems

OTHER TEACHING FACILITIES AND FINANCES

11 The college should have a working medical library, to include the more modern text and reference books with the *Index Medicus,* the Surgeon-General's Index and other serviceable indexes The library should receive regularly thirty or more leading medical periodicals, the current numbers of which should be in racks or on tables easily accessible to the students At the end of each year these periodicals should be bound and added to the files of bound periodicals The library room should be properly lighted and heated and open during all or the greater part of the day, it should be equipped with suitable card indexes as well as with tables and chairs, and have a competent librarian in charge

12 There should be a working medical museum having its various anatomic embryologic pathologic and other specimens carefully prepared labeled and indexed so that any specimen may be easily found and employed for teaching purposes It is suggested that so far as possible with each pathologic specimen coming from postmortems there also be kept the record of the postmortem the clinical history of the patient on whom the necropsy was held and microscopic slides showing the minute structures of the disease shown in the gross specimen The museum furnishes an excellent means of correlating the work of the department of pathology with that of the clinical departments

13 There should be sufficient dissecting material to enable each student individually to dissect at least the lateral half of the human cadaver to provide cross-sections and other demonstration material and to allow of a thorough course for each senior in operative surgery on the cadaver

14 For modern experimental laboratory work in physiology, pharmacology and bacteriology as well as for medical research, a supply of animals—frogs, turtles rabbits and guinea-pigs, if not also cats and dogs—is essential Proper provision, also, is necessary for the housing and care of such animals In any use made of animals every precaution should be taken to prevent needless suffering and work by students should be carefully supervised

15 Each college should have a supply of such useful auxiliary apparatus as a stereopticon, a reflectoscope carefully prepared charts embryologic or other models, manikins, dummies for use in bandaging a roentgen-ray and other apparatus now so generally used in medical teaching

16 The college should show evidences of thorough organization and of reasonably modern methods in all departments, and evidences that the equipment and facilities are *being intelligently used* in the training of medical students

17 A clear statement of the college's requirements for admission tuition time of attendance on the classes sessions, courses offered and graduation should be clearly set forth together with complete classified lists of its matriculants and latest graduating class in regular annual catalogues or announcements

18 Statistics show[9] that modern medicine cannot be acceptably taught by a medical school depending solely on the income from students' fees No medical school should expect to secure admission to or be retained in Class A therefore which does not have an annual income of at least $25 000 in addition to the amount obtained from students fees

---

CLASSIFICATION OF MEDICAL COLLEGES

Revised to Aug 1 1920

CLASS A—ACCEPTABLE MEDICAL COLLEGES

ARKANSAS	
University of Arkansas Medical Department*	Little Rock
CALIFORNIA	
Leland Stanford Junior Univ School of Med	San Francisco
University of California Medical School	San Francisco
COLORADO	
University of Colorado School of Med	Boulder-Denver
CONNECTICUT	
Yale University School of Medicine	New Haven
DISTRICT OF COLUMBIA	
Georgetown University School of Medicine	Washington

15 Class A rating restored Feb 4 1917
16 Rating raised to Class A Feb 15 1915
17 Rating dropped to Class B June 1 1920 It is being reorganized at Tuscaloosa as a two year medical school
18 Rating raised to Class B Feb 3 1918
19 Suspended in 1920
20 Rating dropped to Class B June 3 1912
21 Rating dropped to Class B Feb 15 1915
22 Rating raised to Class B Feb 4 1917
23 Rating dropped to Class B Feb 24 1914
24 Suspended medical teaching in 1918 retains a nominal existence till 1921 to grant degrees to students of three remaining classes who are completing their medical education elsewhere
25 Rated in Class B June 6 1910 rating dropped to Class C Feb 3 1918 Suspended medical teaching in 1918 retains a nominal existence till 1921 to grant degrees to students of three remaining classes who are completing their medical education elsewhere
26 Formerly the Chicago Hospital College of Medicine Last inspected April 23 1918
27 Rated in Class C since 1907 Last inspected Jan 7 1918
28 This is the medical department of the so-called University of Massachusetts When last inspected—Jan 8 1918—this school was in close association with an osteopathic college and was granting liberal advanced standing for osteopathic courses It was rated in Class C Feb 4 1918
29 Formerly the Central College of Osteopathy in 1917 under an amended charter took the name of Central College Medical Department assumed present title in 1918 Rated in Class C March 15 1918 Still teaches both osteopathy and medicine in the same building and by the same faculty
30 This institution is reported not recognized by the Missouri State Board of Health It is an off hoot of a Class C institution likewise reported not recognized by the Missouri State Board of Health No higher rating than Class C could be granted it pending an inspection which it has refused
31 Rating dropped to Class C July 1 1909 In 1915 it merged with the Medical Department of the National University of Arts and Sciences but in 1917 it was reestablished In 1918 reported not recognized by the Missouri State Board of Health

Queen's University Faculty of Medicine[33]	Kingston,	Ont
Western University Faculty of Medicine[34]	London,	Ont
Montreal School of Medicine and Surgery	Montreal	Que
Laval University Faculty of Medicine	Quebec,	Que

The University of Alberta at Edmonton besides the pre-medical year gives only the first two years of the medical course as measured by that of the medical schools of the United States It has not been classified

ENTRANCE REQUIREMENTS OF MEDICAL COLLEGES

Seventy-seven medical schools are now requiring, as a minimum for entrance *two years* or more of work in a college of liberal arts in addition to a four-year high-school education and voluntarily submit reports to the Council by which the enforcement of their published requirements may be verified The years when each college puts into effect respectively, the one-year and the two-year requirements, and the rating of each college, are as follows

College	One Year	Two Years	College Rating
ALABAMA			
University of Alabama School of Medicine	1914	1915	B
ARKANSAS			
University of Arkansas Medical Department	1915	1918	A

Total in 38 medical schools	348

* Have loan funds also

Loan Funds

Besides the twenty-one colleges marked by an asterisk (*) in the above list which have loan funds for deserving but needy students, such funds are available also at the six following medical schools

College of Medical Evangelists Loma Linda Calif
Tulane University of Louisiana School of Medicine New Orleans La
University of Missouri School of Medicine Columbia Mo
University of Nebraska College of Medicine Omaha Neb
Wake Forest College School of Medicine Wake Forest N C
University of North Dakota School of Medicine University N D

DESCRIPTION OF MEDICAL COLLEGES

Below are given brief descriptions of the medical colleges in the United States and Canada that are legally chartered to teach medicine, several of which do not grant degrees The name, address, year of organization, history and date when first class graduated are given in each instance Unless otherwise stated, a class graduated each subsequent year Where official reports have been received from the college, information regarding faculty entrance requirements, length of term, fees, students (excluding specials and postgraduates), graduates, name of dean and next session is given without discrimination, regardless as to whether the college is sectarian or not In a few instances in which such reports were not received, the information published is from other reliable sources Figures for graduates include all who graduated since July 1, 1919 Extract of rules and the membership of the Association of American Medical Colleges are shown following the list of colleges Figures showing population of cities and states are taken from the United States Census Bureau's estimate for 1918 except that in cities marked with an asterisk (*) the census returns for 1920 have been given Statements have been added showing the preliminary requirements held by state licensing boards where those requirements include one or two years of collegiate work Ten states Alaska (Ter), Illinois, Iowa, Michigan New Jersey, North Dakota Pennsylvania, Rhode Island, Texas and Washington, require also a year's hospital internship as an essential qualification for a license

Figures from 1920 Census returns

ALABAMA

Alabama, population 2,395,270, has one medical college, the School of Medicine of the University of Alabama, located in Tuscaloosa, a city with a population of 11,996*

In order to secure licenses to practice medicine in Alabama, students matriculating in the session of 1915-16 and thereafter must have completed two years of work in an approved college of liberal arts, including courses in physics, chemistry, biology and a modern language, prior to entering on the study of medicine This applies to all graduates of 1919 and thereafter

Tuscaloosa

UNIVERSITY OF ALABAMA SCHOOL OF MEDICINE, University Campus Tuscaloosa—Organized in 1859 at Mobile as the Medical College of Alabama Classes graduated in 1861 and subsequent years excepting 1862 to 1868 inclusive Reorganized in 1897 as the medical department of the University of Alabama Present title assumed in 1907, when all property was transferred to the University of Alabama In 1920 clinical teaching was suspended and the medical school was removed to the university campus at Tuscaloosa During the next year only the work of the freshman year will be given In 1921 1922 and thereafter the first two years of the medical course will be given Total registration for 1919 1920 was 51 graduates 10 The fifty fifth session begins Sept 6 1920 and ends May 25 1921

ARKANSAS

Arkansas population 1,792 965 has one medical college, the Medical Department of the University of Arkansas, located in Little Rock, a city of 64 997* Hereafter it offers only the courses of the first two years of the medical course.

To secure licenses to practice medicine in Arkansas, students matriculating in the session of 1918-19 and thereafter must have completed two years of collegiate work including college courses in physics, chemistry, biology and a modern language before beginning the study of medicine This applies to all graduates of 1922 and thereafter

Little Rock

CANADA

The Dominion of Canada has nine medical colleges, all but one of which require a five-year course including in the first year courses in physics, chemistry and biology. This course is practically equal to that in the colleges of the United States which require one year of college work for admission, including the science courses named. None of the Canadian colleges has a minimum requirement of two years of collegiate work, or its equivalent, preliminary to or as a part of the medical course. The medical school at Edmonton, Alberta, gives only the first two years of the medical course, or three years, including the preliminary science year.

Alberta

UNIVERSITY OF ALBERTA FACULTY OF MEDICINE, Edmonton.—Organized in 1913. Offers only the first four years of the six-year medical course, including the two preliminary science years. The faculty numbers 26. Fees for the first year are $64; for the second, third and fourth years, each $98. The registrar is Cecil F. Race, B.A. The registration for 1919-1920 was 135. The eighth session begins Sept. 27, 1920, and ends May 12, 1921.

Manitoba

UNIVERSITY OF MANITOBA FACULTY OF MEDICINE, Winnipeg.—Organized in 1883; first class graduated in 1886; and a class graduated each subsequent year. The faculty numbers 90. The total fees for the five years respectively are $175, $165, $170, $160 and $160. The entire course covers five years, the first year including premedical courses in physics, chemistry and biology. The Dean is Dr. S. Willis Lrovatt. Total registration for 1919-1920 was 219; graduates, 24. The next session begins Sept. 14, 1920, and ends April 15, 1921.

Nova Scotia

DALHOUSIE UNIVERSITY FACULTY OF MEDICINE, Halifax, N. S.—Organized in 1867. Incorporated as the Halifax Medical College in 1868. Reorganized as an examining faculty, separate from the Halifax Medical College, in 1875. In 1911, in accordance with an agreement between the Governors of Dalhousie University and the Corporation of the Halifax Medical College, the work of the latter institution was discontinued and a full teaching faculty was established by the University. By an arrangement between Dalhousie University and the Provincial Medical Board of Nova Scotia, the final professional examinations are conducted conjointly by the university and the Provincial Medical Board, graduates may qualify at the same time for their academic degree and the provincial license. [illegible] faculty of 40 professors, lecturers, demonstrators, etc. Preliminary and examinations, and a graded course of [illegible] medical course in physics, chemistry, [illegible]. The fees are $145 per each of the first [illegible] $125 each [illegible]. The total registration for 1919-1920 was [illegible]. The Dean is Dr. John Stewart. The next session [illegible] 29, 1920, and ends May 26, 1921.

Ontario

UNIVERSITY OF TORONTO FACULTY [illegible]
in 1843 as the Medical Faculty [illegible]
Regulations [illegible] in 1887. In 1919
Department of Medicine [illegible]

of study covers six years of eight months each the first two being devoted largely to physics chemistry biology and cultural courses in history science and English It has a faculty of 54 professors and 217 lecturers associates etc a total of 271 The fees are $160 each year graduation fee $20 The Dean is Dr A Primrose The total registration for 1919 1920 was 1 082 graduates 74 The next session begins Sept 28 1920 and ends May 31 1921

QUEEN'S UNIVERSITY FACULTY OF MEDICINE Kingston—Organized 1854 first class graduated in 1855 and a class graduated each subsequent year The faculty was originally a department of the university but a separation took place in 1866 when the school was conducted under the charter of the Royal College of Physicians and Surgeons at Kingston In 1892 the school again became an integral part of Queen's University The faculty includes 22 professors and 28 assistants instructors etc a total of 50 The fees for the six years are respectively $140 50 $140 50 $143 $144 $144 and $134 fee for M D C M degrees $30 The course covers six years of thirty teaching weeks each the first year including courses in physics chemistry biology English and French or German The total registration in 1919 1920 was 229 graduates 21 The Dean is Dr J C Connell The next session begins Sept 29 1920 and ends May 29 1921

WESTERN UNIVERSITY FACULTY OF MEDICINE London—Organized in 1881 first class graduated in 1883 and a class graduated each year subsequently The medical school has been under the control of the Board of Governors of the Western University since 1913 The faculty numbers 43 The course is six years of eight months each the first year including premedical courses in physics chemistry and biology The total fees for the six years respectively are $150 $145 $145 $153 $153 and $178 The Acting Dean is Dr Paul S McKibben Total registration for 1919 1920 was 119 graduates 11 The next session begins Oct 4 1920 and ends May 26 1921

Montreal

McGILL UNIVERSITY FACULTY OF MEDICINE—Founded 1824 as Montreal Medical Institution became the Medical Faculty of McGill University in 1829 first class graduated under the university auspices in 1833 No session between 1836 39 owing to political troubles In 1905 it absorbed the Faculty of Medicine of the University of Bishop College The course extends over six years of eight months each including the two preliminary years The faculty numbers 135 The total fees for each of the first five years are $167 sixth year $197 The Registrar total registration for 1919 1920 was 624 graduates 52 The Registrar is Dr John W Scane The next session begins Oct 1 1920 and ends June 6 1921

UNIVERSITY OF MONTREAL MEDICAL FACULTY Montreal—Organized in 1843 incorporated in 1845 as the Montreal School of Medicine and Surgery In 1891 by act of parliament the Medical Faculty of Laval University (organized in 1878) was absorbed Present name assumed in 1920 A class was graduated in 1843 and in each subsequent year The faculty numbers 80 The course extends over five years including premedical courses in physics chemistry and biology The total fees for the five years respectively are $110 $118 $126 $126 and $138 The Dean is Dr E P Lachapelle The total registration for 1919 1920 was 267 graduates 32 The next session begins Oct 3 1920 and ends June 30 1921

Quebec

LAVAL UNIVERSITY FACULTY OF MEDICINE Quebec—The Quebec School of Medicine organized in 1848 became in 1852 the Medical Department of Laval University first class graduated in 1855 and a class graduated each subsequent year The faculty numbers 35 The fees are $90 each year The course extends over five years the first year including courses in physics chemistry and biology The Dean is Dr Edwin Turcot Quebec Total registration for 1919 1920 was 149 graduates 25

THE ASSOCIATION OF AMERICAN MEDICAL COLLEGES

The requirements for admission to and graduation from colleges holding membership in this association are 15 units of high school work and two years (60 semester hours) of college work

CURRICULUM The entire course of four years shall consist of not less than 3 600 hours and shall be grouped in divisions and subdivided into subjects each division and each subject to be allotted approximately the number of hours and percentages of the whole shown in the following schedule

DIVISION I

ANATOMY 684 HOURS (19%) Minimum 50% of 3 600 Hours

1 Gross anatomy including clinical or applied anatomy
2 Microscopic anatomy
3 Embryology

DIVISION II

PHYSIOLOGY AND CHEMISTRY 468 HOURS (13%) 19%

1 Physiology
2 Biochemistry

DIVISION III

PATHOLOGY AND BACTERIOLOGY 468 HOURS (13%) 8%

1 Pathology including necropsies 5%
2 Bacteriology including serology and immunology
3 Preventive medicine and public health 8%

DIVISION IV

PHARMACOLOGY 216 HOURS (6%) 6%

1 Materia medica and pharmacy
2 Pharmacology

DIVISION V

MEDICINE AND MEDICAL SPECIALTIES 900 HOURS (25%)

1 General medicine including laboratory diagnosis 15 %
2 Pediatrics 4 %
3 Nervous and mental diseases 3½ %
4 Dermatology and syphilis 2 %
5 Medical jurisprudence ½ %

DIVISION VI

SURGERY AND SURGICAL SPECIALTIES 648 HOURS (18%)

1 Surgery 11 %
2 Orthopedic surgery 2 %
3 Urology 1 %
4 Ophthalmology 1½ %
5 Otology rhinology and laryngology 1½ %
6 Roentgenology 1 %

DIVISION VII

OBSTETRICS AND GYNECOLOGY 216 HOURS (6%)

1 Obstetrics including obstetric surgery 4 %
2 Gynecology 2 %

When teaching conditions demand it a subject may be transferred from one division to another

HOSPITALS FURNISHING ACCEPTABLE INTERNSHIPS

(Revised to August 1, 1920)

The following general hospitals in Section I are considered in position to furnish acceptable internships for medical graduates The hospitals in Sections II and III offer opportunities for physicians who seek further training along certain specialties The internships in these hospitals, therefore should be considered as supplementary and should be based on an internship taken in a general hospital

There are other hospitals which are probably eligible for admission to this list but are omitted either because they have failed to supply information on which any decision regarding them might be based or because they have definitely stated that they do not use interns

SECTION I GENERAL HOSPITALS, TOTAL, 469, 2,960 INTERNSHIPS, BEDS, 103,997

MEDICAL EDUCATION IN THE UNITED STATES

For the twentieth consecutive year we publish this week statistics dealing with medical education in the United States The statistics are complete, and one needs but to review them to note the many improvements that have been made since 1901, when the publishing of these statistics was begun

CHANGES OF THE YEAR

In all medical schools during the last session there were 14,088 students, or 1,036 more than during the previous session These increases are in the first, third and fourth year classes, smaller second year classes following naturally the small freshman enrolment in the fall of 1918 caused by war conditions The medical schools have passed the low ebb in enrolments which was expected with the enforcement of higher entrance requirements, and the pendulum is now swinging the other way It is encouraging to note that the increased enrolments have been most marked in Class A medical schools, the number enrolled this year having increased from 87 9 to 89 6 per cent of all students The percentage in Class B schools decreased from 8 3 to 4 8, and in Class C schools it increased from 3 8 to 5 6 The figures for Class C schools, however, are uncertain since they are based on unverified reports

The number of graduates this year was 3,047, or 391 more than in 1919 Note here, also, that the number of graduates of Class A colleges was increased by 470, while the numbers graduating from Class B schools decreased by 116 Of the Class C colleges, there were thirty-seven more graduates than in the previous year It is pleasing to note that the number of graduates holding degrees from colleges of arts and sciences increased from 1,180 to 1,321, which is 43 5 per cent of all graduates

The number of medical colleges is eighty-five, the same number as last year One Class B college [1] closed its doors, while a Class A college,[2] previously reported as having closed, determined to continue its existence for two more years

1 The College of Physicians and Surgeons of Los Angeles the College of Medicine of the University of Southern California

2 Fordham University School of Medicine New York City

CHANGES IN SIXTEEN YEARS

The improvements in medical education during the last sixteen years have been noteworthy In 1904, when the Council on Medical Education was created, the United States had more medical schools than all other countries of the world combined, the supply far exceeding the needs of the country While the number of colleges has been reduced from 162 to eighty-five during the sixteen years, the number enforcing an entrance requirement of two years or more of collegiate work increased from four (2 5 per cent of all colleges) in 1904, to seventy-eight (92 9 per cent) in 1920 The number of medical students was decreased from 28,142 to 13,052—the lowest number—in 1919, but, during the same period, the number who had higher preliminary qualifications was increased from 1,761 (6 2 per cent of all students) in 1904, to 13,408 (95 2 per cent) in 1920 The number of graduates was reduced from 5,747 to 2,656—the lowest number—in 1919, but the number having higher preliminary qualifications was increased from 369 (6 4 per cent of all graduates) in 1904, to 2,842 (93 3 per cent) in 1920 While the annual totals of colleges, students and graduates have been decreased by about 50 per cent, the number of better colleges is nineteen times larger than in 1904, and the numbers of better qualified students and graduates are nearly eight times larger

OTHER IMPROVEMENTS IN MEDICAL EDUCATION

Other improvements have also been made in medical schools Formerly, many had no university connection, were conducted for profit, or were dependent solely on students' fees Most of them had inadequate buildings and laboratory space, inadequate clinical material, and their curriculums were only partly graded At present, all but a few are integral parts of high grade universities, they are enjoying increased incomes, either from state appropriations or private endowments, many have erected new college buildings and installed more and better equipped laboratories, they have employed larger numbers of full-time teachers, the majority are now carrying on more or less effective research, all have established closer relationships with hospitals furnishing more abundant clinical facilities, and the majority have adopted better methods of teaching in both laboratory and clinical departments These changes are producing physicians who, both educationally and professionally, are far better equipped to assume the responsibility for the prevention and cure of disease than those graduating in any former period

COST OF MEDICAL EDUCATION

These improvements have naturally added largely to the cost of medical education Tuition fees have been increased by some of the medical schools, but not to so great an extent as to cover the cost of medical teaching, which is from three to several times what is charged for tuition fees The difference, of course, is met by state aid and private endowment The

increased fees, meanwhile, will not prevent any deserving student from obtaining a medical education through a lack of money During the last sixteen years, about 350 scholarships have become available in thirty-eight of our better medical schools, and generous loan funds have been provided for students of this class

FUTURE IMPROVEMENTS NEEDED

The World War materially emphasized the need of still further improvements, many of which were already recognized Not only should there be improved methods of clinical instruction in our undergraduate schools, but better and more abundant opportunities should be established for physicians to obtain graduate work Already courses are being established so that physicians can devote from one to three years to work in the various specialties Shorter courses should also be provided whereby physicians can devote their entire time during a few weeks or a few months to work along any narrow line of work in which they may be particularly interested The pressing need in medical education today is for better and more abundant opportunities for graduate medical education

NEW PROGRESS IN OLD FIELDS OF THERAPY

The recognized importance of digitalis in modern therapy is attested by the fact that digitalis preparations of some sort now form a part of the drug armamentarium of every physician Yet we suspect that few equally well known drugs are the subject of as much uncertainty and variation in efficacy in the hands of the "busy practitioner" Many decades have elapsed since Withering introduced digitalis into medical practice, but its therapeutic possibilities as well as its limitations are still worthy of renewed careful study

Some of the progress in the field of digitalis therapy was summarized [1] at the New Orleans session of the Association Foremost, perhaps, is the growing recognition of the need of pharmaceutic digitalis preparations of known potency Now that the crude leaves which contain the active drugs are collected in many places where they are grown under a diversity of agricultural conditions, it would be surprising, indeed, if the content of potent principles were not variable in different lots Under these circumstances, galenic preparations must necessarily vary with the leaf from which they are prepared Thanks to the development of appropriate methods of physiologic assay, however, digitalis preparations can now be evaluated in terms of their real potency In this way it has been ascertained that pharmacy no longer is dependent on restricted areas for drug plants, furthermore, products can be prepared which are stable and constant, as pharmacopeial standards demand

Again, the physician has learned largely through the leadership of Cary Eggleston,[2] how to estimate digitalis dosage on the basis of body weight, whereby the haphazard guesswork of "drops per day" has been improved on Furthermore the desirability of employing the drug in doses sufficient to produce the requisite beneficial results is being emphasized as never before As the possibilities of overdosage can be recognized by the occurrence of symptoms such as nausea, or with greater refinement by the electrocardiogram, it becomes possible to push the dosage speedily to the limit of tolerance with corresponding therapeutic advantages Under proper control the estimated amount of digitalis has even been given in a single dose so that effects which ordinarily require a week for their manifestation may be obtained within thirty-six hours [3] There remains the important need of differentiating more clearly the patients for whom digitalis is actually indicated, so that it may be used both wisely and well Finally, the medical observer should learn from the history of digitalis therapy that even in the long tilled fields of practice, experience and investigation may be applied to yield information that is new and useful

THE DIETARY VALUE OF FRUITS

"Why do we eat fruits?" Few persons have stopped to consider the answer to this question, and it is somewhat doubtful, whether an entirely satisfactory reply can be formulated It requires only a moment's reflection, however, to conclude that any group of food products which enters so extensively into the dietary of mankind must have some virtue worthy of notice Investigators are agreed that the fruits do not rank high as sources of energy to the body Otherwise expressed, their calory values are rather low in comparison with the preponderance of the common food products The fruits are almost without exception devoid of fats and poor in protein, at most the true nutrients are represented by a small content of carbohydrate, such as the sugars in the banana and the orange Water forms a large part of their make-up in every instance

Writers on nutrition in the past have been accustomed to refer to the value of the "mineral nutrients" in fruits although it would be difficult, indeed, to make any unique claims for them in this respect Of lime or phosphoric acid, for which the body is most likely to feel a need at times the fruits surely cannot be regarded as valuable contributors Many of these plant products contain organic acids, notably in the case of the citrus fruits To these dietary tradition has ascribed a laxative potency When it is recalled however that most of the fruits also contain more or less indigestible vegetable constituents such as waxes gums and cellulose-like carbohydrates one may well be inte

2 Eggleston Cary Digitalis Dosage Arch Int Med 16 1 (July) 1915

3 Robinson C C Am J M Sc 159 1 (Jan) 1920

to choose between organic acids and "roughage" for an explanation of the laxative action popularly accepted

Certain fruits, as well as a number of green vegetables, have long been understood to exhibit a quite different potency best expressed in their antiscorbutic effects The latter are now ascribed to vitamins, that group of as yet ill-defined properties or substances which promote well-being in ways that still require elucidation However indefinable it may be at present, the role of orange juice in averting disaster under certain conditions of feeding or in promoting the nutrition on certain dietary regimens is beyond dispute

Aside from the recognized value of various fruits as antiscorbutics,[1] a reason why they may be used liberally in the diet is given in the new investigations of Osborne and Mendel[2] They have demonstrated that the fresh juices of the edible parts of the orange, lemon and grapefruit contain the vitamin frequently spoken of as water-soluble B or antineuritic vitamin The efficiency of these juices is not lost by suitable modes of desiccation It is, indeed, surprising to learn that the potency of orange juice, for example, in the water-soluble vitamin, is comparable, volume for volume, with that of cow's milk This must not be understood, of course, to apply to the nutrients as sources of energy, but only to the content of vitamin It is even hinted that orange juice may contain some fat-soluble vitamin, if so, it will have been demonstrated to yield all the at present known types of vitamins Little wonder that this citrus fruit has acquired a dietary popularity The advocates of a national temperance drink may be disappointed in the relatively poorer showing of grape juice as a source of the vitamin

Apples and pears are not devoid of vitamin of the water-soluble variety, though they cannot be rated as rich in this food factor Prunes are apparently somewhat richer in it Osborne and Mendel justly remark that the new observations with fruits place the dietary value of these foods, hitherto recommended because of their salt content, their laxative properties, or their antiscorbutic property, in a new light as sources of water-soluble vitamin It is not justifiable to ascribe superior virtues in this respect to all fruits, for the banana has already been found lacking in pronounced vitamin potency What a vitamin-containing product like the orange may contribute to nutrition in man has been demonstrated in the growth of infants by Byfield, Daniels and Loughlin[3] The fruits, always regarded as palatable, are having their real worth established at length in a scientific way

Current Comment

HOSPITALS PROVIDING ACCEPTABLE INTERNSHIPS

We publish this week a list of the hospitals which, after careful consideration by the Council on Medical Education and Hospitals, have been considered in position to furnish satisfactory internships for medical graduates This is the fourth revision of the list first printed in pamphlet form in 1914 Since that time, however, more complete data have been secured so that the present list is correspondingly more reliable The list includes 593 hospitals having a total of 361,162 beds and providing opportunities for 3,420 interns Those listed represent only about 10 per cent of all hospitals in the United States having ten or more beds, although they have about 50 per cent of the total bed capacity Altogether, only 1,126 out of the 6 440 reported that they desired to have interns, and only 593 were found in condition to furnish satisfactory intership Some did not send reports on which a reliable decision could be made For a general training the student is urged to enter one of the 469 general hospitals The state and special hospitals are better for those who have already had their general internships but who wish to secure further training in some particular specialty This list will undoubtedly be of great service to medical students in selecting a hospital where a satisfactory internship can be obtained

THE HOSPITAL INTERN PROBLEM

As noted in the previous comment, 593 of the 6,440 hospitals in the United States require annually 3,420 interns, or about 400 more than are turned out this year by the medical schools Nevertheless, these hospitals represent a very small proportion of all hospitals in the country, and the number seeking interns is increasing It can be seen, therefore, that the number of students graduating annually is not sufficient to supply interns for all the hospitals seeking them, far less to meet the demand if all general hospitals should desire to use them This, meanwhile, is one of the bases for the claim that there is a dearth of physicians It can readily be seen, however, that sufficient interns could not be provided for all hospitals even if the annual number of graduates exceeded by several times the normal output for this country The intern problem must be solved in some other way Many hospitals, even now, are employing physicians as residents or house officers at increasing salaries or with gradually increasing privileges in the way of practice Interns, also, should be relieved of much of the work required of them which should be done by orderlies employed for that purpose History-writing and records, which have depended largely on intern service, can be kept up by staff physicians through the use of stenographers It is certain that the increased demand for interns does not justify either the lowering of educational standards or a multiplication of medical schools

BENEFITS FROM MEETINGS OF PROFESSIONAL ORGANIZATIONS

The president of the American Bar Association[1] in an open letter to the members, defines that organization as the "tie of fraternal interest in all that concerns the profession that binds it together." While the communication is addressed to members of the legal profession, its truth applies equally to physicians. The following statement regarding the value of the annual session is paraphrased but little in order that it shall appeal to Fellows and members of the American Medical Association:

> The sight of the leaders of the medical profession is stimulating. It adds much to the interest with which a medical paper is read if the author is not an abstraction but a creature of flesh and blood whose personal appearance is known and whose voice has been heard. Of these things I am sure: that the sense of brotherhood and the belief in the friendliness and nobility of the profession will be strengthened by such contact, and that faith in the zeal and integrity of members of the profession will be justified by experience. The reserve potential strength of a profession like ours can be summoned to effective exercise only through an association, national in scope, and wielding the consolidated strength of a united and thoroughly patriotic organization.

The meetings of the constituent state medical associations and of the component county medical societies present opportunities both for an interchange of professional knowledge and for an appreciation of personality which must make all better fitted to render professional services to their fellow men.

CAREERS FOR MEDICAL MEN

The higher educational qualifications now required of medical students and the greatly improved methods of instruction have resulted in multiplying the careers, aside from regular practice, which are now open for graduates of medicine. At the present time, for example, the graduate may enter the medical service of the Army, the Navy or the Public Health, Canal Zone or Indian services, he may find a special opportunity in industrial medicine, in insurance, as a school physician, in public health work, on hygiene boards, in administrative work in general hospitals, or as a medical attendant in an institution for the insane, the crippled or the feebleminded. There is also an increasing demand for medical missionaries and for medical teachers abroad. There is a growing demand for medical teachers and unusual opportunities in medical research. There is an increasing number of research institutes, providing special advantages with fair incomes for physicians especially qualified for investigative work. So many, indeed, are the opportunities for the well educated physician, aside from regular practice, as to more than justify the present reasonably high standards of preliminary and medical education. The great increase in the number of careers open to medical men are not only benefiting larger numbers of well trained graduates in medicine but also, through their activity and influence, insuring a better understanding in the future of problems relating to public health and the prevention and cure of disease.

1 Carson, H. L.: Reasons for Joining the American Bar Association, July, 1920.

THE DIGESTION OF EGG WHITE BY INFANTS

In the progress of the sciences on which medical knowledge is based many traditions and items of empiric information have received justification often most unexpectedly, by the discovery that they are based on significant truths. On the other hand the enlargement of the horizon of verifiable facts has not infrequently resulted in discrediting prejudices and preferences that have been fostered without demonstrable justification. Thus, uncooked starch has categorically been classed as a substance indigestible in the human alimentary tract and therefore to be shunned as a dietary component. Yet in a recent issue of THE JOURNAL[1] the untenability of this long taught assumption was pointed out on the basis of unexceptionable evidence that healthy men can ingest, without detriment, quantities of raw starch exceeding 200 gm. a day. The myth that infants lack an amylolytic enzyme in their saliva has disappeared before actual investigation of the child rather than by reading a textbook. In fact, we suspect that more than one infant has been given some uncooked starch in the form of cereal decoction without untoward effects. Another tradition of the impotence of the alimentary apparatus in infancy has been broken by Grulee,[2] who has examined the stools after feeding egg white. Despite the fact that the extremely delicate precipitin test was used the raw protein was found to have disappeared from the bowel in almost every case in which the quantity of egg protein ingested was not unduly large. As Grulee concludes, it would seem from his studies that egg albumin is as a rule broken down completely by the digestive processes in infants and children. This holds good even when egg white is used in small quantities for the new-born. The alternative that egg albumin is completely absorbed unchanged is unlikely.

NO DEARTH OF PHYSICIANS

The rapid decrease in the enrolments of medical students and in the number of physicians graduating annually during the last sixteen years has been frequently misinterpreted as having resulted in a scarcity of physicians in the United States. But what are the facts? In 1904, it will be remembered this country had more than half the world's supply of medical schools, many of these were conducted for profit, competition was strong, solicitors visited offices, factories and crossroads to bring in students. As a result, medical schools were crowded far beyond the normal needs. Then came the campaign for improvement. Mergers of medical schools began to take place, others of extremely low grade ceased to exist, and higher entrance requirements were generally adopted. It was expected that the numbers of medical colleges, students and graduates would be considerably reduced. At the same time, the annual number of graduates with higher educational qualifications was largely increased. The only time in several decades when the demand for physicians exceeded the supply was during the brief

1 Behavior of Uncooked Starch in the Digestive Tract: Current Comment, J. A. M. A., 75: 111 (July 10), 1920.

2 Grulee, C. G.: Precipitin Test for Egg Albumin in Stools, Am. J. Dis. Child., 20: 15 (July), 1920.

period of the war, but then the demand was equally great for skilled workers in all other lines of human endeavor, except during the severe influenza epidemic There is no scarcity of physicians so far as numbers are concerned, and the supply of better qualified medical men is being rapidly increased Meanwhile, as shown by the statistics published this week, the pendulum is swinging back and the numbers of both medical students and graduates show marked increases over the previous year It is satisfactory to know, however, that the increased quantity represents also an improved quality from the standpoint of both preliminary and professional education

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS EDUCATION PUBLIC HEALTH, ETC)

DISTRICT OF COLUMBIA

Tribute to Dr Kober—On the occasion of the seventieth birthday of Dr George M Kober, March 28 his pupils, friends and co workers in the Medical Society of the District of Columbia and allied scientific societies and civic organizations, at a dinner in his honor, tendered him a silver loving cup as a testimonial of their admiration and esteem The same friends have joined in issuing an anniversary volume, which has just come from the press as the George M Kober anniversary number of the *American Journal of Physical Anthropology*, of which Dr Kober has been an associate editor since its inception Besides a number of scientific articles dedicated to Dr Kober the volume contains an account of the special tributes recently paid to Dr Kober and recounts his work for the cause of scientific medicine, public health and social welfare

ILLINOIS

Clinics to Be Established—A venereal disease clinic has been opened in the courthouse at Rock Island under the supervision of Dr Daniel F Paul——Children of Rock Island suffering from tonsillitis or other throat infections may receive free treatment at a clinic to be established at St Anthony's Hospital under the charge of Drs Daniel F Paul, Lewis Ostrom, Jr, Charles E Robb and Carl J F Rochow

Mobile Diagnostic Laboratory—The mobile diagnostic laboratory maintained by the division of diagnostic laboratories of the state department of public health is proving of great value, not only in the suppression of epidemics, but in the rapid and accurate completion of communicable disease surveys Under the present arrangement a laboratory technician may be at any point in the state within a very short time carrying with him all necessary material This traveling laboratory is so equipped that it may be in active operation immediately after arrival

Childbirth Mortality During the Influenza Epidemic—The division of vital statistics has made a detailed investigation of the mortality of women in the puerperal state and of children prematurely born or dying during gestation, on account of the influenza and influenza-pneumonia epidemic During the epidemic of January and February of this year, in the state outside of Chicago, there were 210 deaths of mothers and 171 deaths of infants from this cause, or a total of 381 Excluding Cook County the highest mortality was in Williamson County with 17 deaths and the next highest in Winnebago County with 15, Lake County was third with 14, LaSalle County fourth with 13, and Kane County fifth in order with 11 deaths

INDIANA

Hospital Reopened—Goshen Hospital which has been closed on account of a difference of opinion between the board of directors and the physicians of the staff, has been reopened under the management of Mrs Laura Fell White

Chemical Research Workers Organize—A new medical society has been organized in Indianapolis to emphasize the value of chemical research It is composed of members of the Indianapolis Medical Society who are interested in that branch of the profession and starts out with a charter membership of more than sixty-six Dr Murray Hadley is president and Dr Homer Hamer, secretary-treasurer

MONTANA

Honor Medical Guests—A dinner in honor of physicians visiting in Butte after the state medical society meeting at Helena was given by members of the staff of the Murray Hospital at the Butte Country Club July 16 The guests of honor were Drs Melvin S Henderson, Rochester, Minn, Cresswell T Pigot Roundup president of the state medical society, Elmer G Balsam Billings, secretary of the society, and George E Brown, Miles City

Tuberculosis Fighters Elect Officers—At the annual meeting of the Montana Association for the Study and Prevention of Tuberculosis held in Helena, July 12, the following officers were elected president, Mr H R Cunningham Helena, honorary vice presidents Gov S V Stewart and senators T J Walsh Helena and W A Clark, Butte, vice presidents, Mrs P H McCarthy Butte and Drs Lewis Allard, Billings, and Oscar M Lanstrum Helena, secretary, Mrs Sara E. Morse, and treasurer, Mr T O Hammond, Helena

State Health Board Building Dedicated—The newly completed state board of health building at Helena was dedicated with impressive ceremonies July 12 The principal addresses were delivered by Prof W M Cobleigh, Bozeman state chemist, on 'The Relation of the Montana Public Health Association to the State Health Agencies", the governor, Chairman Dan D Donohue Butte, president of the state board of health, Dr James A Hayne, Columbia, S C, state health officer of South Carolina, Dr Henry M Bracken, Minneapolis of the War Risk Bureau, Dr Edward M Larson, Great Falls president of the state medical association, Mr Harry Call head of the state Red Cross, Dr Oscar M Lanstrum, Helena, and chancellor E C Elliott of the state schools

NEW YORK

Counsel of State Society Resigns—*James Taylor Lewis*, Esq, for the last twenty years legal adviser of the Medical Society of the State of New York has resigned to take effect September 1 Mr Lewis has been compelled to resign because the society has declined to increase his salary to keep up with the ever increasing expense connected with the conduct of his office

Personal—Dr Samuel W Hamilton formerly a member of the staff of the Utica State Hospital, has been appointed chief medical director of the Hospital for Mental Diseases, Philadelphia——Dr Halsey J Ball, Glens Falls, has been appointed sanitary supervisor of the district which includes the counties of Oneida, Herkimer, Madison and Otsego——Dr G Walter Zulauf assistant superintendent of the Buffalo General Hospital, has been appointed superintendent of the Allegheny General Hospital, Pittsburgh, succeeding Dr John M Lawler, resigned

WASHINGTON

Personal—Dr James E Crichton, Seattle formerly vice chairman of the Seattle Red Cross [illegible] Mr Earl Kilpatrick as division manager [illegible] ——Dr Frank A Plum Seattle [illegible]

director of the City Hospital, Philadelphia, succeeding Dr Paul A Turner, resigned

Trudeau Society Election—The Washington Trudeau Society was organized at the closing session of the annual convention of the Washington Tuberculosis Association at North Yakima, July 9 Membership in this society is restricted to physicians who confine their practice to tuberculosis, and the following officers were elected president, Dr Fredericka Slyfield, Seattle, vice president, Dr Frank M Miller, Spokane, honorary vice presidents, Drs Edward R Baldwin, Saranac Lake, N Y, and Christen Quevli, Tacoma, secretary, Samuel J Cary, Seattle, and treasurer, Dr Leon G Woodford, Everett

WYOMING

State Society Meeting—The Wyoming State Medical Society will hold its eighteenth annual meeting at the Elks' Home, Cheyenne, August 9 and 10, under the presidency of Dr George P Johnston, Cheyenne On the first evening the delegates will be entertained at dinner at the Cheyenne Country Club, by the Laramie County Medical Society Among the visiting speakers will be Drs James M Patton, Omaha, whose subject is "The Doctor and the Adult Blind", Josiah N Hall, Denver, who will present a paper on 'The Diagnosis of Empyema" with roentgen-ray pictures and Dr Thomas E Carmody, Denver, who will speak on "Focal Infections"

CANADA

New Professors from Great Britain—Principal Bruce Taylor of Queens' University, Kingston Ont, and Dr Walter T Connell are in England and have engaged Dr James Miller, Edinburgh for the chair of pathology, and Dr L J Austin, London, for the chair of clinical surgery at the university Additional important appointments are shortly to be made

Public Health News—During the five year period from 1914 to 1918 and excluding influenza, tuberculosis claimed more lives in Saskatchewan than any other communicable disease The average death rate for tuberculosis was 45 per hundred thousand as compared with 6.2 for measles, 8.2 for whooping cough, 8 2 for diphtheria, and 8 8 for typhoid fever There is a steady increase in the death rate from tuberculosis from year to year In 1914 it was 35 2 per hundred thousand, 1915, 38.2, 1916 44 6, 1917, 47 4, 1918, 54 5, making the average for the period 45

Hospital News—St Michael's Hospital, Toronto, has in view enlargement of that institution provided the serum treatment of cancer as introduced by Dr Thomas J Glover, Toronto, proves a permanent success Dr John A Amyot, Ottawa, deputy minister of public health, has paid a visit to Toronto and inspected the patients, microscopic specimens and pathologic exhibits and expresses his opinion that the serum is promising The hospital authorities have asked Dr Julian D Loudon Toronto, chief in medicine, to work with Dr Glover and Dr Edmund E King Toronto, surgeon to the hospital, has also been pressed into service in the cancer clinic

Personal—The Canadian Red Cross Society has appointed Dr Ruggles K George, Toronto as director of information on public health——Dr Peter MacNaughton, formerly assistant superintendent at the Hamilton Ont, Hospital for the Insane, has been appointed superintendent of the Coburg Hospital, which was formerly the Ontario Military Hospital, but which has been made a provincial hospital for insane—— Dr William K Ross of the Kingston Provincial Hospital for the Insane, has been appointed superintendent of the Brockville Hospital for the Insane, succeeding the late Dr John C Mitchell Dr Fulton S Vrooman, who has been assistant superintendent at Brockville, has been transferred to a similar position at the Toronto institution Dr George E Kidd on the staff at Brockville, succeeds Dr Vrooman and Dr Robert D Fletcher, Winnipeg, Man, goes to the Toronto institution as an assistant physician

GENERAL

Secretary of American Medical Association Undergoes Operation—Dr Alexander R Craig was operated on August 4 for cholelithiasis As we go to press his condition is reported as favorable

Diagnosis School Established—On account of the numerous tuberculosis activities which have centered recently in Springfield Ill this city has been selected by the United States Public Health Service as the location for a school of diagnosis for acting assistant surgeons and local examiners assigned to the care of sick and wounded soldiers in the eighth district, comprising the states of Michigan, Wisconsin and Illinois

Warning—A Texas physician sends the information that a man calling himself J P McLay and claiming to be a representative of the Jones Service Company of Kansas City is traveling in Texas, selling a service fee for $70 He suggests that this may be the same individual against whom a warning was issued in THE JOURNAL, July 24, under the name of J P McKeen

Emergency Dressing Parcel—A standard emergency surgical dressing parcel has been adopted by the American Red Cross, and endorsed by the Surgeon-General of the Army, the Section on Surgery of the American Medical Association the American College of Surgeons, and the Conference Board of Physicians in Industrial Practice The parcel is wrapped in heavy brown paper, sterilized and paraffined, and contains ten gauze compresses, one absorbent pad one rolled wadding bandage, one muslin bandage one gauze bandage, one triangular bandage and one safety pin

Appropriation for Social Hygiene Work—In the sundry civil bill the sixty-sixth Congress appropriated $1,565,000 to the United States Interdepartmental Social Hygiene Board for use during the fiscal year ending June 30, 1921 This includes $80 000 for the expenses of the board, $400 000 for assisting states in protecting the military and naval forces of the United States against venereal diseases, $750 000 for allotment to the various states for the prevention treatment and control of venereal disease, $85,000 for payment to universities, colleges and other suitable organizations and institutions to discover more effective measures in the prevention of venereal disease, and $250 000 for payment to universities, colleges and other suitable institutions and organizations to discover and develop more effective educational measures in the treatment of venereal disease

FOREIGN

Gasoline Privileges for Physicians—Farmers, physicians and veterinarians are given priority in the distribution of gasoline in France, according to a recent decree

Appropriation for Work on Heredity—The Prussian Academy of Sciences has granted Dr Agnes Bluhm 1 000 marks to continue her experimental work on problems of heredity

Tribute to Depage—In recognition of Depage's work at the hopital de l'Ocean, in the narrow strip of Belgium that was not invaded by the enemy, his pupils and friends are planning to present him with a torso bust, the work of a leading Belgian sculptor

Tribute to Pérez—Our Vienna exchanges mention that the university authorities recently held a special meeting in honor of Dr F Perez the ambassador from Argentina in Vienna, in token of gratitude for his efforts on behalf of the university Perez name is associated with the bacteriology of ozena

Disease Menaces Italian Charcoal Burners—Pellagra, malaria and influenza are said to have caused the deaths of many Italian charcoal burners in the district of Citta di Castello during the last few months This is believed to be due to the universal diet of polenta and life in the unhealthy marshes surrounding the town

Petition to Name a Street for Surgeon—The *Paris medical* relates that twenty of the members of the municipal council of Paris have signed a petition asking that some street in Paris be named for Dr H Morestin in token of appreciation of his services during the war, so many persons owe to him the reconstruction of their faces

International Surgical Congress—At the meeting of the Fifth International Surgical Congress, held in Paris July 19 to 22, representatives of thirteen nations presented papers During the mornings clinics were held in the various hospitals of Paris in the afternoons and evenings, the scientific program was carried out Sir William MacEwen, professor of surgery in Glasgow University, was elected president, and London was selected as the next place of meeting, the date being fixed as July 16 1923

Swedish Government Aids Medical Journals—The *Svenska Läkartidningen* records the appropriation by the government of 5 000 crowns to aid the Swedish Medical Association in publishing its three journals the semimonthly quarterly and transactions Three journals devoted to hygiene are given from 1 000 to 1 500 crowns and four specialist journals from 500 to 1,200 To aid in starting the new *Acta Oto-Laryn-*

gologica, 4,000 crowns are appropriated Each of the journals specified is to donate a number of copies to the university libraries

Medical Journals Increase Subscription Price—The medical section of the Italian Association of the Scientific Press has been considering that the cost of paper has gone up 1,000 per cent and of printing 300 per cent, with other expenses increasing to correspond, and consequently it has voted to increase by 100 per cent the subscription price of the Italian weekly medical journals for the last half of 1920, even for the subscribers already enrolled Other journals not published so often are to have the subscription price increased by 50 per cent The notice appears in the *Policlinico* of June 28, signed by Prof G Sanarelli, president of the association

Medical Center in Constantinople—Americans in Constantinople have established a hospital as the nucleus of a medical center in the Near East Admiral Bristol, the American high commissioner, is chairman of the board of directors which includes representatives of the American Chamber of Commerce, the American Red Cross the American Committee for Relief in the Near East, the Constantinople College for Women, various missionary boards and Robert College The equipment for the hospital, which will have a capacity of 100 patients is to be supplied by the American Red Cross and the personnel by the American Red Cross and American Committee for Relief in the Near East Dr A R Hoover will be director of the hospital and Dr Elfie Richards Graff, assistant director

Deaths in Other Countries

Dr J Bjerrum, the leading ophthalmologist of Denmark, aged 68 Bjerrum's method of perimetry, test types etc, and his manuals of ophthalmology have made his name familiar He retired from his chair in the medical faculty of Copenhagen in 1910——Dr L Rydygier, professor of surgery at the University of Lemberg a pioneer in resection of the stomach and of invagination aged 70——Dr J B Miranda, formerly professor of toxicology and pharmacy in the medical faculty of Santiago, Chile, at an advanced age

Government Services

Hospitals to Take War Risk Cases

Sixteen naval hospitals have been notified that they will be expected to take in war risk cases for reconstruction, provided they have sufficient available personnel These patients are to be in addition to Navy or Marine Corps patients There are at present 3,200 beds available at naval hospitals When accommodations can be furnished local representatives of the Bureau of War Risk Insurance will be notified

Return of General Gorgas' Body

Instructions have been issued for the United States Army Transport *Pocahontas* to stop at Southampton, England on its return from Europe to take on board Mrs Gorgas and the body of General Gorgas The *Pocahontas* was expected to touch at Southampton about *July 26* The final arrangements for General Gorgas' funeral will not be announced until the arrival of the body in the United States, but the interment will be at Arlington

Schools for Medical Officers

Arrangements have been made with the Surgeon-General that not to exceed five medical officers of the National Guard may attend the course at the Army Medical School Washington, D C, which begins on or about October 1 and continues about eight months Applications through the Adjutant-General of the respective states should be made to the Militia Bureau before September 15——The Adjutant-General of the Army has approved the application of the Surgeon-General for the development of the field school for the medical department on the Carlisle, Pa military reservation Notice will be given later of the opening of this school National Guard officers may attend this school and will be entitled to the same pay (not above that of captain) quarters etc, while actually in attendance at the school and the same travel allowances to and from the school as are allowed officers of the Regular establishment

Foreign Letters

LONDON

(From Our Regular Correspondent)

July 17, 1920

The Increased Subscription of the British Medical Association

As stated before, the subscription to the British Medical Association has been increased by 50 per cent—from $10 50 to $15 75 The reasons given are the depreciation in the value of money and increase in virtually all forms of expenditure Comparing the year 1919 with 1918 the cost of printing increased by $20 000 paper by $17 500 staff expense by $10 000 and meetings of the council and committee by $11 500 These items with increased capitation grants to branches amounted to a total increase of $65 000 Against these increased expenses there was an increase of subscriptions of about $10,000 and from advertisements and sale of the *Journal* of $45 000 For the year 1920 the estimated expenditure is $435 000 and income $418 000 Almost every item of expenditure is expected to be increased Moreover there are new items of expenditure—a Scottish office with a whole-time secretary which will cost $6 000 a year, an intelligence department costing about $4 000 a year and the newly established lectures which cost probably $1 000 The increased annual expenditure for 1920 may easily prove to be $75 000 If the subscription were not raised a net increase of 1 000 members would be expected in 1920 The average number of resignations from the association in recent years has been 472 In 1913 when the subscription was raised from $6 to $10 50 the number of resignations was 2 675 It may be concluded, therefore that the increased subscription will cost the association 2,200 members The membership is now more than 22 200, so that if the same number leave the association it would be left with a membership of 20 000 Allowing 7 000 for oversea members and those who pay a reduced fee as junior members of the profession the association would have $68 000 additional income A smaller increase of subscriptions would meet the immediate needs, but it is considered necessary to have a reserve so as to be able to meet additional demands without further increase of subscription

Failure of Sanatorium Treatment

Dr W H Dickinson medical adviser of the insurance committee of Newcastle on Tyne gives a depressing picture of the prospects of the industrial consumptive Out of 1 086 patients, only fourteen in whom tubercle bacilli were found in the sputum had secured arrest" of the disease and were still alive and well when the report was completed Even this is not the worst for in respect of six of these there was some doubt as to the accuracy of the original observation, leaving only eight certain cases This gloomy outlook is further illustrated by the histories of 1 126 patients, of whom 733 died while receiving sanatorium benefit and a further sixty-four died after discontinuing the treatment making a total of 797 known deaths Treatment was stopped on account of arrest' of disease in only 108 instances Of these persons eighty-one are now working or fit for work four are known to have died nine are still alive but have relapsed, and four teen cannot be traced The report proceeds The outlook for a patient of the industrial classes in whose sputum tubercle bacilli have been demonstrated on at least two occasions is well-nigh hopeless under conditions similar to those that have prevailed in the past. Although much suffering has been relieved and many lives have been prolonged the result achieved as measured by the number of patients cured or restored to full working capacity is small considering the amount of

it behooves us to find out where we have failed and why Ninety per cent of the patients treated in the sanatorium were discharged improved in a greater or lesser degree, but the results were not lasting, and in the great majority of the cases relapse occurred under domiciliary treatment owing to failure to reproduce sanatorium conditions, or anything approaching them, in the home It follows, then, that much of the money expended on sanatorium treatment has been wasted, and this state of affairs will continue until the conditions under which domiciliary treatment is administered are drastically reformed Domiciliary treatment has proved the weakest link in sanatorium benefit, and this is particularly unfortunate, seeing that more than 80 per cent of the treatment granted was given to the patient while living in his own home

PARIS

(From Our Regular Correspondent)

July 16, 1920

Compulsory Physical Education

The senate recently passed an act to organize physical education on a national basis The first article of the act provides for compulsory physical education of children of both sexes, boys over 6 years old until their embodiment in the army or navy, and girls in primary and secondary schools, according to the special regulations governing public education

Medical Theses

At its last session the council of the Paris medical faculty again took up the question of theses Heretofore, each graduate was required to deposit 200 copies of his thesis, this has been reduced to sixty-five, with the object of reducing the expense incident to printing the pamphlets As these copies were intended primarily for exchange with foreign universities, it follows that the exchanges would necessarily be restricted and this would detract considerably from the diffusion of French science abroad and of foreign works in France The council therefore decided that the measure is susceptible of further study, the saving realized by the student being of less importance than the interference with the diffusion of French thought An inquiry among publishers showed, in fact, that the saving amounts to about 40 francs for each printed signature, perhaps 100 or 120 francs on the average thesis costing 500 francs

The Dangers of Neomalthusianism

For some time now, contraceptive apparatus have been sold openly by a large number of druggists and rubber merchants, and it is not an unusual sight to see them displayed in the show windows This deplorable state of affairs moved the Alliance nationale pour l'accroissement de la population française to address a special appeal to all druggists of France, asking them, in the interest of the country, to discontinue the sale of such apparatus In its appeal the Alliance laid stress on the fact that the reduction of the birth rate constituted a very grave danger to France

Unfortunately this is all the more true since at the present time a neomalthusian campaign is under way in certain industrial centers It has gotten so that at Roubaix-Tourcoing a communist syndicate the Union des travailleurs, during the first five days of July distributed more than 40,000 copies of a pamphlet in street cars and at factory gates, even tossing them into the doorways of workmen's houses Although the pamphlet bore the printer's name no legal action has been brought against the authors, printers and distributors For that reason the consortium of the textile industries of Roubaix-Tourcoing, constituted of 312 manufactures employing more than 70 000 workers which since March 1, has been granting a family bonus of 1 franc for each child and a maternity allowance of 200 francs, has protested vigorously against the inaction of public authorities The consortium has expended 25,000 francs per day in family bonus since March 1, and it is certainly regrettable that all these efforts are neutralized by an infamous campaign conducted in broad day

Committee on Social Hygiene

A campaign committee on social hygiene and prophylactic instruction was recently organized for the following purposes (1) the establishment of a bureau of information, literature and publicity on all questions relating to social hygiene, (2) the creation of centers of popular instruction in social hygiene and of normal courses for teachers and special workers, (3) the collection of propaganda material, (4) the formation of regional committees, and (5) the organization of a congress on social hygiene education

Federation of International Medical Societies

M Willems has called the attention of the Academy to the fact that Dr F C Simpson of Pittsburgh recently spent several months in Europe with a view to interesting the medical profession of the world in the project conceived by American scholars of reorganizing on a uniform basis all international societies related to the various branches of medicine It is proposed to create a federation of these societies and to establish an international medical press bureau which shall be charged with making known all important discoveries to the medical press of the world, thus assuring rapid diffusion of medical knowledge

A committee of ten, composed of two physicians from each of five countries, Belgium, France, Great Britain, Italy and the United States, has been named and will meet immediately in Paris or London to set the new organization on foot

Belgium, which already has many reasons for feeling devoted to America, cannot but greet with joy this new achievement of a great people American genius has distinguished itself by a happy mixture of realism and idealism and it has wrought some remarkable solutions of the economic and scientific problems which mankind faces

Memorial to Physicians Fallen in the War

The families and friends of physicians who fell on the field of honor gathered, June 10, for the unveiling of a monument commemorating the glorious sacrifice of the fallen heroes The marble tablet bearing the name of each was placed in the hall of the military hospital of Brussels, and before a profoundly affected assembly presided over by the minister of national defense, Dr Wibin extolled the unselfishness of their heroism in impassioned and vibrant terms To those who have gone, he expressed the deep gratitude of the youth of Belgium for the self-sacrifice which made victory possible

Honors to Dr Bainbridge

Dr William Seaman Bainbridge of New York has just been nominated corresponding member of the Academie royale de Belgique Besides his works on cancer, special attention is called to the excellent report on war surgery which he published after a trip to both sides of the front

Venereal Prophylaxis

Although the venereal peril is increasing from day to day in almost all countries, it is impossible to give special attention to all the measures proposed for counteracting the evil In Belgium, venereal diseases constitute a formidable endemic which the war has only increased M Bayet recently maintained before the Academie de medecine that all hope of

effective control through administrative measures should be abandoned In order to be successful a campaign must be undertaken by the medical profession itself The profession should have representation on the Conseil superieur d'hygiene through the colleges and medical societies, it should recommend the candidates for appointment as dispensary directors, and should take an active part in the working of the dispensaries The Conseil superieur d'hygiene should be a sort of Conseil d'Etat, which should work out reforms and forward the recommendations to the administrative officers for detailed enforcement In case of irreconcilable dispute, the question could be submitted to the public through mediation of the Academie de medecine

The academy voted unanimously in favor of a resolution that the study of all questions of prophylaxis and social hygiene and of the necessary measures of execution should henceforth be confided to competent medical authority the academy, Conseil superieur, officers of the government and medical societies, and that the practical enforcement of these measures should be entrusted to the association and general collaboration of all practitioners

Cajal and his New Institution

The government has established the Instituto Cajal It is not an entirely new institution, but the bringing together of several laboratories which operated under the auspices of the Junta de Pensiones para el Extranjero (Foreign Fellowship Board) In fact, the laboratory for biologic investigations (created in 1900 with the Moscow international prize granted to Cajal) is now extended to include sections on general physiology, normal and pathologic histology, neurology, experimental pathology, etc On the unanimous motion of the government, approved by the king, the new center of education will be named Instituto Cajal Cajal, in order to devote all of his time to this institute has resigned as director of the Instituto de Alfonso XIII, which is another state institution devoted to the combating of infectious diseases and the manufacture of biologic products In connection with the creation of the new institute, there has been much talk of Cajal recently, general homage being rendered to his talents, his activities and the many excellent qualities of this man, as talented as he is modest Cajal is as well as ever, is preparing a splendid psychologic histology and exhibits his genius in all the copies of the journal of his laboratory for biologic investigations Cajal, however, is prone to pessimism which occasionally makes him believe, as about two years ago, that he suffered from cerebral arteriosclerosis His words at the time were widely copied in the medical journals, but as a matter of fact and fortunately for science his wonderful brain is not involved at all and his neurons show no signs of senile degeneration

Cajal's pessimism is always instructive and convinces any one who listens to his arguments In Cajal's opinion, as he told me, war has its roots in the innermost part of the human soul 'From the cave man (as shown by the war scenes in Cagul's cave and other representations of the prehistoric man who lived more than a hundred thousand years ago) to the modern human being all men have always considered collective looting and murder honorable and necessary, and have never been at a loss for reasons to explain their aggressions How can it be hoped that man who was always a wild beast will change suddenly his customs and bloody instincts? When I hear that *Homo sapiens* will very soon decide peacefully his quarrels in accordance with the principles of law I am as much amazed as if they told me that tigers will become some day harmless, herbivorous animals" Cajal takes very much to heart the sad spectacle presented by our politicians and repeats Humboldt's phrase that the Spaniards lack political sense In Cajal's opinion he should have added "They are almost completely deprived of the instinct of preservation Cajal however believes in the intellectual future of the race but its disintegrated atomism its wild individualism handicap the patriotic impulses of the few statesmen we have in this country Cajal advises a law according to which no politician could become a minister unless he had spent at least three years in Germany, France England and the United States, learning the difficult science of governing free peoples He would do likewise with the majors and colonels Do you believe," he asked me that we would have lost our colonies if the ministers the generals and the admirals besides knowing political geography, had spent compulsorily two or three years among the Yankees?'

The Medical Strike

The Spanish socialist party nowadays evolutionizing toward syndicalism has its headquarters at the well known Casa del Pueblo, where are planned virtually all the strikes that upset the economic life of this country One of the institutions utilized by the Casa del Pueblo to influence the Madrid workingmen has been the Mutualidad Obrera an economic and beneficial association, one of the chief assets of which is the medical service it offers its members This Casa del Pueblo has in its turn been threatened with a strike by its own physicians who dared to ask an increase in salary This was refused to them The physicians were amply justified in their request as each of them is compelled to care for 300 families and receives a monthly fee of 50 centimos de peseta (10 cents) for each family, that is, 150 pesetas (about $30) The physicians at this time learned their lesson from labor threatened to strike, and have obtained an increase of their fees to 275 pesetas (about $55)

BERLIN

(From Our Regular Correspondent)

June 28, 1920

Socialization of Medical Practice

In order to avoid the evils of kassen practice, which are increased by the brutal demeanor of the officials in the guise of employers, there has lately been an increase in the number of those physicians who without being affiliated with the social democratic party are inclined to vote for so called socialization of medical practice This scheme for "state medicine is part of the Erfurt program of the social democratic party and under its provisions all medical and obstetric attendance and all medicines would be furnished free of direct charge The whole notion of the workings of this scheme is shown in an article by Dr Kollwitz of Berlin in a recent number of the *Deutsche medizinische Wochenschrift* 'In the present transitional period physicians are being asked to decide whether they wish to engage exclusively in private practice or place themselves at the disposal of the public service In the latter event they will not receive fees for individual services or a capitation allowance but a fixed salary They will be obligated to remain in the public service for a stated number of years or until disabled Their period of duty shall generally embrace a certain number of hours corresponding to the normal working day The appointment entails in addition the grant of a disability pension and care of dependents The post of duty will be determined by the preliminary training and residence of the physician, b transfers and changes will be prescribed partly to [illegible] monotony and partly to furnish rel [illegible] at will be given free to all Members of

then no longer constitute a special category of patients, and division and tearing apart of the kassen system (from an economic and business point of view one of the most unsatisfactory works of the past) will be superfluous Since society will furnish medical assistance to everybody, the krankenkassen will disappear entirely or they will function only as auxiliary relief societies The ambulant sick will be treated in public consultation offices, the bedridden will be attended in their homes, and those suffering from serious illness or contagious diseases will be taken to hospitals Consultation offices will be distributed, like the schools and postoffices, throughout the country, depending on the particular needs Physicians will serve at these offices in monthly rotation, and an eight-hour day will be divided into three hours at the office and five hours on house visits or in public health work General practitioners and specialists will be assigned to each office and their services will be available day and night Division of duties within the offices will be made by a committee chosen from the interested physicians The assignment of men to posts in the consultation offices, hospitals, sanatoriums, research laboratories and examination stations will be determined by a council of physicians and finally by the ministry of health" As may readily be conceived, the great majority of physicians recognize that these provisions will bring many disadvantages to physicians and patients alike, and will be in large measure impracticable Because of a desire for professional freedom, physicians are opposing the socialization of medical practice except those belonging to the social democratic party and a few fanatics for liberty

At the meeting of physicians last year, a resolution opposing state domination of medical practice was adopted, in the interest of the patient, the physician and medical science, on the ground that a personal relation of confidence between physician and patient was unconditionally necessary The consistent introduction of the policy of free selection of physicians, unrestricted by officialdom, in the whole kassen practice will assure most perfectly the fulfilment of the most comprehensive missions of medicine Fortunately the national assembly rejected the proposal of an independent social democrat to socialize the practice of medicine and obstetrics and the manufacture and sale of drugs under control of the ministry of health During the debate the minister of the interior declared that he considered socialization of medical practice as inexpedient Meanwhile as a result of the elections of June 6, the social democratic party is excluded from the government and the danger of renewed attempts is temporarily averted

Marriages

HUGH FRANCIS LENA, New London, Conn, to Miss Helen Frances Gartland of Dorchester, Boston June 26

WILLYS MERRITT MONROE Guabita Panama to Miss Edith Marjorie Bates of Cristobal, Panama, July 22

LAWRENCE KRAMER GUNDRUM, Fontanelle Iowa, to Miss Ethel Henshaw Martin of St Louis, June 12

MAX SHAWEKER New York to Miss Mary Kathryn Keplinger of New Philadelphia, Ohio, June 14

HERBERT MAXWELL NASH WYNNE, Minneapolis to Miss Ethel Maxwell of Everett, Mass June 1

ALBERT ERNEST GALLANT, Forest Hill Gardens, L I to Mrs Mary Claire Parsons, June 14

ISOM ALFRED RANKIN, Morning Sun, Iowa, to Miss Dorothy Bemis of Bondurant, Iowa, June 18

JAY CLEVELAND BYERS, Dorchester, Neb, to Miss Linda C Snow of Alexandria Va, June 22

WALKER ELY SWIFT to Miss Dorothea Valentine Abbott both of New York, July 18

EDGAR POE SANDROCK, to Miss Dorothea Gertrude Peters, both of Baltimore, July 22

Deaths

Burton Jay Merrill ⊕ Stillwater, Minn, Bellevue Hospital Medical College, 1881, aged 64, coroner and county physician of Washington County, Minn, professor of materia medica and therapeutics from 1886 to 1888 in the St Paul Medical College, physician to the State Prison since 1889, died, July 16, from heart disease

Johann Franz Dolina, Dayton Ohio, University of Konigsberg Germany, 1889, aged 60, a member of the Ohio State Medical Association, died in the Miami Valley Hospital, Dayton, July 12, from hemorrhage following razor wounds of the throat presumably self-inflicted

Elias Lester, Seneca Falls, N Y, College of Physicians and Surgeons in the City of New York 1863, aged 86, assistant surgeon, U S Army, and brigade surgeon during the Civil War, the oldest member of the Seneca County Medical Society, died, July 18

Truman P French, Chicago, Indiana Medical College Indianapolis, 1878, aged 69, a member of the Illinois State Medical Society, for many years a practitioner of Vermillion County, Ill, died at the home of his son in Springfield, July 13

Eli P Edwards, Paris, Texas, Hospital College of Medicine, Louisville, 1881, aged 69 a member of the State Medical Association of Texas, who was operated on in the Sanitarium of Paris, July 1, died in that institution, July 4

Hugh Sutherland Kinmouth, Asbury Park, N J, College of Physicians and Surgeons in the City of New York, 1870, aged 72, died near Delmar, N J July 21 from the effects of poison believed to have been self-administered

Albert Shunk, Mansfield, Ohio, College of Physicians and Surgeons in the City of New York 1886, aged 57, a member of the Ohio State Medical Association, died, July 14, from a gunshot wound of the head self-inflicted

Felix Barrett, Westbrook, Me, United States Medical College New York, 1883, Medical School of Maine, Brunswick and Portland, 1893, aged 59 a member of the Maine Medical Association, died, April 27

John Joseph Kenny, New York, Columbia University College of Physicians and Surgeons, New York 1915, aged 37, a member of the Medical Society of the State of New York, died in Roosevelt Hospital, July 24

Victor Parsonnet ⊕ Newark, N J, Long Island College Hospital Brooklyn, 1898, aged 49, visiting gynecologist and president of the medical staff of the Beth Israel Hospital, Newark died suddenly, July 20

Frank Beebe ⊕ Johnstown, N Y, Albany N Y Medical College 1881, aged 65, mayor of Johnstown from 1907 to 1909, died at the home of his daughter in Eau Claire, Wis, July 9, from pneumonia

Edward Montrose Smith ⊕ Bridgeport Conn, College of Physicians in the City of New York 1882, aged 60, once president of the Bridgeport Medical Association, died, July 14 from pneumonia

Tinsley V Ware, Springfield Mo (license Missouri State Board of Medical Examiners, 1883), aged 88, for many years a practitioner and druggist of Lebanon, Mo, died, July 16

Charles Frederick Hill, Newark N J, Baltimore Medical College 1908, aged 38 a member of the Medical Society of New Jersey, died in Pequannock N J, July 9, from tuberculosis

Marie Geraldine Langdon, Englewood Cliffs N J, Baltimore University School of Medicine 1904 Woman's Medical College of Pennsylvania, Philadelphia, 1905, aged 51, died, June 21

Rozell McGlathery ⊕ Conklin Colo, Tulane University New Orleans 1908, aged 37 died, July 14 from a gunshot wound believed to have been self-inflicted with suicidal intent

Charles Oscar Cranston, Parsons Kan, Kansas City (Mo) Medical College 1894, aged 51, died in St John's Hospital Joplin Mo, July 18, after a surgical operation

⊕ Indicates Fellow of the American Medical Association

George Frederick Pitts, Warwick, N Y , University of the City of New York, 1877, aged 71, a member of the Medical Society of the State of New York, died, July 22

Walter Samuel Mickler, Lee Fla , Southern Medical College, Atlanta, Ga , 1895, aged 47, died in a hospital in Greensboro N C, July 21, from gastric ulcer

Abraham Huntsinger, Mishawaka, Ind , Bennett College of Eclectic Medicine and Surgery, Chicago, 1877, aged 81, died June 30, from cerebral hemorrhage

Christopher C Rutherford, McDade, Texas, Tulane University, New Orleans 1881, aged 81, died at the home of his son in Giddings, Texas, July 14

Joseph Farley ⊕ Philadelphia, Jefferson Medical College 1886, aged 58, died at his summer home in Atlantic City, July 19, from cerebral hemorrhage

Harry Chester Ewing, Colorado Springs, Colo , University of Colorado, Boulder and Denver, 1911, aged 36, died, April 7, from pulmonary tuberculosis

Harry E Campbell, Pittsburgh, Jefferson Medical College, 1881, aged 60, died in a rooming house in New York, July 25 from cerebral hemorrhage

Charles C Williams, Pittsburgh, Cleveland University of Medicine and Surgery, 1894, aged 48, a veteran of the war with Spain, died July 21

Cornelius W Cramer, Pentwater, Mich , Hahnemann Medical College, Chicago, 1886, for forty-five years a practitioner, died, about July 12

George Albertson Parker ⊕ Southampton, Pa , University of Pennsylvania, Philadelphia, 1875, aged 65, died, July 24, from heart disease

Henderson Hines, Rago, Kan , Cincinnati College of Medicine and Surgery, 1866, aged 89, died, July 15, from cirrhosis of the liver

Horace L Martin, Atlanta, Ga , Medical College of Georgia, Augusta, 1893, aged 54, died at a sanitarium in Atlanta, July 2

Cassius E Belcher, Barnesboro, Pa , Cincinnati College of Medicine and Surgery, 1877, aged 60, died, July 15, from nephritis

Henry Adams Carr, Elmira, N Y , University of the City of New York, 1879, aged 77, died in Utica, N Y, June 25

John Irving Van Wert ⊕ Patton, Pa , Bellevue Hospital Medical College, 1887, aged 55, died in New York, July 25

William T Gaines, Nashville, Tenn , University of Nashville, Tenn, 1882, died in an infirmary in Nashville, July 17

Charles Turner Fisk, Portland Me (license Maine State Board of Registration, Act of 1895), aged 71, died June 11

John M Shutt, Fort Wayne Ind (license, Indiana State Board of Medical Examiners, 1897), aged 70, died, July 17

William L McNeill ⊕ Port Arthur Texas Kentucky School of Medicine, Louisville, 1897, aged 53, died, July 3

Theodore Raymond Parker ⊕ Willimantic Conn , University of the City of New York, 1880, aged 64, died, June 18

Edwin Herbert Russell, Los Angeles Calif Boston University, School of Medicine 1880, aged 63, died, July 16

Eva Harding, Topeka, Kan , Hahnemann Medical College, Chicago, 1882, aged 62, died, July 27 from heart disease

Israel Albert Loveland ⊕ Keene, N H , Dartmouth Medical School, Hanover N H 1875, aged 69, died July 5

William Jacobs, Washington Kan , American Medical College, Eclectic, St Louis, 1876, aged 75, died, July 16

William H Crowley, Chicago, Rush Medical College 1896, aged 53, died at his old home, Potsdam, N Y , July 26

Thomas Norman Pearson, Morrill Me , University of Vermont, Burlington, 1893, aged 55, died May 28

Virgil Thompson, New York New York Homeopathic Medical College, New York, 1862, died June 8

Fred Bellinger Casey, Mohawk N Y , Albany (N Y) Medical College, 1892, aged 53, died July 19

Charles Saraphin Rodier, Manchester N H , Laval University, Montreal, 1887, aged 56, died June 8

George Levi Brown ⊕ Buffalo, Harvard University Medical School, 1870, aged 72, died about July 8

Orville G Hutchinson, Rochester N Y , Eclectic Medical Institute Cincinnati 1891, died, July 9

Correspondence

"CREDULITY AND CURES"

To the Editor —Dr Peterson's article on "Credulity and Cures" (THE JOURNAL Dec 6, 1919) appeals so cleverly to the credulity of the uninformed members of the profession that he is hereby requested to present to the medical profession an unprejudiced scientific discussion of the freudian psychology and the psychanalytic method of treating functional neuroses and psychoses in order that his own interpretations and insight may be fully evaluated, without taking on faith that his personal standing as a psychiatrist and his personal acquaintanceship with Freud and Jung make it impossible for him to be wrong His article is misleading physicians to take a prejudiced attitude toward the treatment of neuroses and psychoses without actually considering why, and this unintelligent resistance is preventing many neurotics and psychopaths from finding a solution for serious conflicts and suffering Dr Peterson's article is not truly assisting the physician to maintain the attitude that he pleads for in his conclusion namely that 'we must try to take a middle path which is broad enough to know that there are great mysteries in our complex organisms and all the sciences that have to do with them and not be too prejudiced to weigh ponder and examine'

He mentions a series of faith" cures, radical surgical operations wild drug cures and eccentric therapeutic methods that have had a more or less popular vogue, and, after doing incalculably more harm than good, have gone to limbo

To this list however in order to balance judgment and not make men perniciously skeptical should be added some illustrations of the long long series of successful clinical anatomic, bacteriologic and physiologic discoveries surgical innovations and therapeutic methods that were once derided and scorned by the suave old fathers of the medical profession

He appeals to the *credulity* of the uninformed physician to accept that he is qualified to attack the work of Freud and Jung because he is personally acquainted with these men has read some of their writings, knows other psychanalysts, and has seen their failures I suppose it is fair politics to ask an uninformed stranger to accept that personal acquaintanceship is sufficient to make one an infallible critic and censor, but when Dr Peterson has their faith in this personal relationship he violates it by making a few brief designing dogmatic assertions which are entirely calculated to bring the theories methods and discoveries of psychanalysis into disrepute without giving the reader the slightest opportunity to judge for himself and examine the errors of Freud and Jung and others He attempts to disparage Freud's discovery of the influence of the wish on human behavior by a prejudiced sketch of how the influence of the wish on the mind of children was discovered Would a reputable surgeon or chemist or psychologist use such methods of criticism of another's work?

This is hardly trying to take a middle path' Dr Peterson surely does not condemn vaccination because it was discovered from a cow Neither would he condemn vaccination and favor laws for its repression because people have died or were mutilated following vaccination Like Dercum Peterson still struggles with the theories and methods which Freud advocated twenty years ago

Is this doleful ignorance or bitter prejudice? Will they deny man the right of self-correction and self-improvement? Have they not changed their own views of psychiatry?

Dr Peterson appeals to the credulity of the medical profession to disregard psychanalysis because it may take several months or even years to treat a case are here no men

diseases, such as tuberculosis, diabetes arteriosclerosis, nephritis and myocarditis, that require expensive treatment and a great outlay of time? Is the physician justified in condemning the use of a therapeutic method on these grounds? He also argues that it is dangerous, causing some to go insane (a very questionable assertion), others to commit suicide, others to get divorces, or become vile, etc Is not surgical practice still burying its thousands, and medical practice its tens of thousands? What physician has not had to bury sad regrets with a patient? It is true that many patients are greatly distressed by the psychanalytic method and so do many patients suffer in order to be cured by other forms of treatment Psychanalysis is not a child's play nor an old man's game Like major surgery, it requires long training, great care and sound, experienced judgment

In surgery and medicine, as in all methods of science and commerce, there will always be crude new methods, a margin of failures and fakers Old methods will always be made to look damnable in the light of newer, while advocates of old conceptions will froth and fume at the work of "faddists" while the "cults" will ridicule the "fossils" and suave moss-backs, even though both may be practicing some excellent as well as ridiculous methods Let us have fairness of criticism and maturity of judgment Who knows what apparently absurd little discovery today will not completely revolutionize medical practice tomorrow? The discoveries of the insignificant little germ and tissue-cell overthrew all the dogmas of the old schools of anatomy physiology, pathology and medical practice So Freud's discovery that the individual has cravings of which he is unconscious (wishes which have a tremendous influence on his thoughts, behavior and health) is forcing the orthodox psychiatry and psychology of the passing decade into disuse

Dr Peterson suggests that if given sufficient encouragement he would advocate the passing of a law prohibiting the psychanalytic method of treating the neuroses and psychoses of young people Why be intolerable of their sufferings from uncontrollable affective cravings? Why like Abraham slay the unhappy son for the glory of God? Why should they not have access to a method of treating maladaptations and fears that has cured hundreds of young men and women and helped them to know themselves? Is it necessary to hew out of mountains great granite slabs and erect in massive letters, so the whole world will be reminded every moment that the most important and most difficult thing in the world is "Know Thyself"

Through the psychanalytic method of studying the insane we have learned that the most potent cause of insanity is *repressed affective cravings,* and this repressive tendency is started early in childhood, not naturally or through the designs of Nature but through the pernicious influence of prudish, purblind fathers and mothers, and dogmatic teachers who are obsessed with sexual phobias

Dr Peterson makes a claim that many psychanalytic case reports show little of the cases and much about the type of mind of the psychanalyst himself This must be accepted There will be quite a rush of untrained physicians to psychanalysis, after failing in other lines of work, who regard tentative guessing and questioning of patients as good practice In every line of endeavor there are fakers and wolves, but—why be like the Prussian officer who destroyed Louvain because one of the citizens committed a crime? Why not "take the middle path" and recognize that we are able to judge much of a man's personality not only by what he writes (as "Credulity and Cures) but also by the manner of his dress, his signature, voice, step, smile, what he reads, the way he operates

If Dr Peterson will give us an unimpassioned, unprejudiced discussion of the new psychopathology and psychanalysis, making the fallacies of reasoning apparent by scientific data and logic, so that the medical profession may judge without having emotions appealed to in a manner that is designed to arouse a biased attitude, then his fairness to science and the affront on the credulity of the medical profession may be redeemed

Dr Peterson ridicules the importance which the "new psychology" places on the emotional value of symbols and dreams, and yet in his article he uses quite a few symbols to express what he *wishes* to say, as for example, "our dreams reflect in a moonlight kind of way the thinking processes of our day"

Ten years' experience with the Freudian psychology and the psychanalytic method in hospitals for mental diseases has demonstrated that psychanalysis has made momentous contributions to knowledge of the nature of man, and that the psychanalytic method is of the utmost value in the treatment of selected cases of nervous and mental diseases

EDWARD J KEMPF, M D, Washington, D C

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed Every letter must contain the writer's name and address but these will be omitted on request

HYCLORITE — DICHLORAMIN T — SURGICAL SOLUTION OF CHLORINATED SODA

To the Editor —1 Please give me some information concerning Hyclorite put out by the General Laboratories Madison Wis as to its antiseptic value and stability 2 Also concerning Abbott's dichloramine T Do these products contain the required amount of chlorin? 3 Also please give me information where I can obtain a chlorin gas to make Dakin's solution

CHARLES T STURGEON M D Los Angeles

ANSWER —1 Hyclorite has been accepted for New and Nonofficial Remedies and reference to the 1920 edition will give the requested information, with regard to the stability of this preparation The description for this product explains that its actions and uses are those of solution of chlorinated soda U S P A general article which precedes this and similar chlorin products contains valuable information about hypochlorites and hypochlorite substitutes

2 Dichloramine-T Abbott is one of the several brands of Dichloramin-T which have been accepted for New and Nonofficial Remedies and which may be depended on to contain the required amount of chlorin

3 New and Nonofficial Remedies describes Chlorine-Soda Ampoules marketed by Johnson and Johnson These are composed of a sealed glass tube containing liquid chlorin and a tube containing sodium carbonate Directions are furnished for preparing surgical solution of chlorinated soda (Dakin's solution)

LITERATURE ON LUNG ABSCESS FOLLOWING TONSILLECTOMY UNDER LOCAL ANESTHESIA AND UNDER GENERAL ANESTHESIA

To the Editor —Will you inform me where I can find some information on the subject of lung abscess following tonsillectomy under local anesthesia also under general anesthesia?

C N C M D Washington D C

ANSWER —The following articles have appeared on this subject

Simpson J R and Nonh H G Report of Two Cases of Lung Abscess Following Tonsillectomy Under Local Anesthesia in Tubercular Subjects *Pennsylvania M J* March 1920

Burger H Lung Abscess after Tonsillectomy *Nederlandsch Tydschr Geneesk* Nov 1 1919 abstr THE JOURNAL Feb 21 1920 p 570

THE AMOEBAE LIVING IN MAN A Zoological Monograph By Clifford Dobell M A I R S Assistant Professor of Protistology and Cytology in the Department of Biology Imperial College of Science and Technology London Cloth Price $3 75 1p 155 New York William Wood & Company 1919

In this volume the author sums up his researches on amebas in man and the lower animals He presents the subject more from the standpoint of comparative protozoology than from the medical point of view He has worked over an immense amount of material—10 000 human stools and 150 kittens experimentally infected with *Endameba histolytica* together with much special pathologic material from a variety of intestinal diseases observed chiefly during the war He discusses at considerable length the several varieties of amebas found in man, and also those found in dogs and in monkeys In the genus *Endameba* he includes three varieties *E histolytica L coli* and *L gingivalis* The first he considers the common cause of amebic dysentery and the second a common nonpathogen of the intestinal canal Regarding *L gingivalis* he says "At present therefore there seems to be no good evidence to support the hypothesis that *L gingivalis* attacks the tissues, that it is the cause of pyorrhea or that it is in any way pathogenic" His manner of presenting a subject is not always concise The presentation of data is frequently mingled with paragraphs of discussions of an argumentative nature which at times become tedious Especially does the author criticize Schaudinn stating that his conclusions regarding the intestinal amebas of man were mostly incorrect But he approves of and uses Schaudinn's nomenclature of dysentery amebas (*I histolytica*) and recommends Schaudinn's sublimate alcohol method as the 'best fixative for cysts" He does not approve of the term "Craigia' believing that adequate evidence for the existence of this organism has not been presented At the end there is an excellent bibliography which is extensive but not complete There is also an index After reading this monograph, one is conscious of at least three difficulties confusion regarding identification confusion regarding nomenclature and inadequate knowledge of the life histories of these organisms Dr Dobell deserves credit for at least some degree of progress along these lines

DISEASES OF THE THROAT NOSE AND EAR For Practitioners and Students By W G Porter M B B Sc F R C S Third edition revised under the Editorship of A Logan Turner M D F R C S (Edin) Professor of Laryngology and Rhinology University of Edinburgh Surgeon Edinburgh Eye Ear and Throat Hospital Price $3 Net 1p 300 with 79 illustrations New York William Wood and Company 1919

This is a concisely written volume [illegible] the practitioner and senior student [illegible] sufficient information on the subject to [illegible] tice With this end in view the [illegible] anatomic description except in special [illegible] are not illustrated Major operative [illegible] volume is chiefly devoted to [illegible] treatment so far as the latter [illegible] specialist This method has [illegible] valuable book for the general [illegible] out exceptions its worth [illegible] four sections devoted respectively [illegible] larynx nose and ear [illegible] described followed by [illegible] nosis and treatment [illegible] occurring in these [illegible] used in the treatment [illegible] and the public [illegible]

or near the time of injection of antigen appear variable and uncertain, more so, perhaps, than might be expected from the demonstrations that antibodies appear earlier in the spleen than in the blood, that antigen is fixed by the spleen, and that in the presence of antigenic substances cultures of splenic tissue outside the body may produce antibodies The results of several experiments indicate clearly that after antibody production is well under way, splenectomy has little or no effect on the course of the antibodies in the blood The antibody content of the blood was not diminished markedly by splenectomy and roentgenization at or near the height of the curve The nature of this so-called resistance remains obscure

Irregular Typhoid Strains—Meyer and Neilson describe the laboratory infections in a vaccinated caretaker exposed to laboratory animals shedding living typhoid bacilli and a laboratory worker also immunized, who was regularly working with strains of the *B typhosus* group The last case apparently caused a severe and fatal house contact infection From the blood and urine of two persons, an irregular, atypical organism, and from the stool and urine of a third typical typhoid bacilli were isolated The possible bearing of these observations on the epidemiology, clinical aspect and bacteriology of typhoid fever is discussed, and it is suggested that special attention be paid to the occurrence and the detailed study of irregular typhoid strains in the typhoid vaccinated

Hemophilic Nonaerogenic Paracolon Bacillus—A bacillus isolated from the urine of a case of bilateral infected hydronephrosis is described by Meyer and Hinman The bacillus is apparently a member of the paracolon group of bacteria found in urine and is best designated as hemophilic nonaerogenic paracolon Samples of urine cultured after the patient had been vaccinated with a heat killed, tricresolized bacterial suspension of the original parasitic strain and after a clinical recrudescence demonstrated the same organism which grew on nonhemoglobin mediums and which in every respect corresponded with the saprophytic strains obtained by successive cultivation on artificial mediums

*Skin Lesion in Measles F B Mallory and E M Medlar Boston—p 327
*Type Cell of So Called Dural Endothelioma F B Mallory Boston—p 349
*Regeneration of Smooth Muscle Cells F B Berry Boston—p 365
*Experimental Production of Pneumonia with Influenza Bacillus of Pfeiffer R H Major Rosedale Kan—p 373

Skin Lesions in Measles—The skin lesions in measles are, without much question, of infectious origin and due to the causal agent of the disease The reasons for these points of view are as follows The lesions are focal in character and discrete, not uniformly distributed like the rash in scarlet fever They are scattered irregularly, sometimes singly, often in smaller and larger groups If numerous enough, they may become confluent Small pieces of skin removed during life from thirty-five patients were studied by the authors and the findings are described in detail The endothelial cells lining the capillaries in the earliest lesions often contain from one to four rarely more, minute intensely staining spherical bodies which vary a little in size In the older lesions the bodies are fewer in number and usually more evident at the periphery of the lesion Still later they disappear entirely The nature of these bodies cannot be determined Similar bodies have not been found in the endothelial cells lining the blood vessels in other acute lesions examined for purposes of control It is suggested that they may be the causal agent, possibly a coccus in various stages of digestion Their positive reaction to the Gram stain would favor this view Study of the nasal, pharyngeal, laryngeal and conjunctival secretions, and of the blood in smear preparations, by dark field illumination and by culture on various media, failed to show any micro-organisms which seemed to bear any etiologic relation to the disease

Dural Endothelioma is a Fibroblastoma—The result of an examination of perfectly typical specimen of a so-called dural endothelioma leads Mallory to suggest that the dural endothelioma, so called, is in reality some form of fibroblastoma The phosphotungstic acid hematoxylin stain showed the real nature of the neoplasm Each cell was surrounded by numerous fine fibroglia fibrils, without question produced by the tumor cells They were better developed in those places where growth was less rapid, but they were everywhere present and were more prominent than the collagen fibrils The production of fibroglia and collagen fibrils is the distinguishing characteristic of the type cell known as the fibroblast The histogenesis of the tumor is discussed

Regeneration of Smooth Muscle—The material for Berry's study was a uterus, into the wall of which a curet had been thrust four days previously Unquestionable regeneration of the smooth muscle was noted Experimental studies made on animals gave the same results Berry considers it doubtful if the condition seen in hypertrophic stenosis of the stomach and in Hirschsprung's disease can be ascribed entirely to simple hypertrophy It would appear, rather, that there must also be some hyperplasia, though in what manner is not clear

Bacillus Influenzae and Pneumonia—The results of Major's experiments indicate that the invasive powers of *B influenzae* are limited When the organisms are injected intravenously the effects produced are to be explained by a toxic action, rather than any direct bacterial action produced by multiplication and spread through the blood stream In no cases were the bacilli recovered from the blood cultures in animals which had been injected intravenously with influenza bacilli Introduction of *B influenzae* into the trachea was successful, in producing bronchopneumonia In these cases also, the invasive properties of the organisms were apparently limited, as the bronchopneumonic patches were small, few in number and confined to the hilus of the lungs The location of these areas also suggested a local direct action of the masses of bacteria, with but little extension to other portions of the lungs A preliminary irritation of the respiratory tract with chlorin gas permitted an extensive invasion with influenza bacilli injected intravenously or intratracheally The pathologic changes produced in the lungs were striking and intense in degree, and resembled the lungs in fatal cases of human influenza In the majority of these cases influenza bacilli were grown from the lungs in pure culture

*Blood in Influenza B Lemchen Chicago—p 102
Cancer of Omentum J N Study Cambridge City Ind—p 103

Pathology and Bacteriology of Pneumonia—Of the fatal cases (seventy-five) of pneumonia studied by Spencer postmortem, 91 9 per cent were bronchopneumonias The lesions were most frequently bilateral and involvement was most often noted in all of the lobes of both lungs Of the lobes involved, the lesions were commonly found in the dependent portions Pleurisy was the most common complication being noted in 72 per cent of cases The pneumococcus *Staphylococcus aureus Streptococcus hemolyticus* and Pfeiffer's bacillus were most frequently noted While in both the fatal cases of pneumonia and in the contacts Type IV pneumococcus predominated, the more virulent Types I, II and III were noted more frequently in the pneumonia cases than in the contacts The number of carriers among the contacts was high, and, as might be expected, the incidence of carriers in the medical wards was greater than in the surgical ward Pfeiffer's bacillus was encountered as often among the carriers as in the fatal cases of pneumonia

Medical Treatment of Acute Polyarthritis—In the medical treatment of acute polyarthritis or what has been termed arthritis deformans, Boorstein urges that all forms of salicylates even acetylsalicylic acid, should be avoided They upset

the digestion and make the condition worse Only those medicaments aimed to promote digestion proper bowel activity, proper circulation, and proper character of the blood should be used It is, therefore, advisable to give strychnin, arsenic, iron preparations, and phosphates The laxative desired can easily be added to these In chronic cases, cod liver oil can be added During the acute or subacute stage, hypodermic injections of sodium cacodylate, given every four or five days in from ¾ to 1¼ grain doses have been found of great help in raising the resistance power Tincture of gelsemium, 5 minims may be used to relieve temporary severe pain If intestinal putrefaction is present, Boorstein uses guaiacol carbonate, 5 grains three times daily None of the lithium or radium waters glandular extracts and vaccines were found to have any value

Blood in Influenza—Leukopenia, great diminution of blood platelets with an increase of the coagulability of the blood were the notable findings made by Lemchen in his series of cases

Infections of Uterus and Cervix—Shroyer claims that 60 per cent of all married women and 30 per cent of all unmarried women have infections of the genital tract These infections are almost invariably located in the cervical endometrium The endometrium of the body of the uterus is practically immune to infection Lacerations of the cervix seldom produce uterine or pelvic symptoms It is the presence of infection in the lacerations that causes disease Among the more frequent germs that cause chronic endocervicitis are the gonococcus the streptococcus the staphylococcus and the colon bacillus Infection of the cervix in nulliparous women is frequent, although it is not at all limited to those who have had sexual intercourse nor are these infections always due to the gonococcus, but the mentioned bacteria any one or several may be the causative factor Properly directed surgical interference offers at present the only method of cure The cervical mucosa must be completely enucleated, care being taken not to destroy the muscle for if the muscle is destroyed during future pregnancies the function of the canal will be lacking

Influenza and Tuberculosis—The records of the Ohio State Sanatorium show that epidemic influenza has had a decided etiologic relation to tuberculosis Forty per cent of the tuberculous patients admitted to the [illegible] 1919

Universities in Medical Research—In his presidential address before the British Medical Association Allbutt states that the universities, ancient and modern, from Alexandria to Edinburgh, have made the professions Universities have fostered research, and maintained standards For each student the university stands for something larger than the field of a particular calling for a more comprehensive design Narrow "specialization" is found in medicine, as in other arts, among people of narrow culture Specializing is prone to be quackish Education must therefore from the first be an introduction to life, not forgetting that some study is a part of life In medicine, Allbutt says, the curriculum may well be called a race! The enlargement of knowledge and means implies more and more instruction, but the limits of the human mind are not indefinitely extensible Some casement may be had however by simplifying our studies, by teaching our teachers, by recognizing two curriculums—one of the diploma and another of the university, by postponing some studies till after graduation The diploma course must play up to outside examiners Speaking of teachers Allbutt says that almost none of them has been taught to teach, and but few are in a position to compare the methods of others with their own Short revision or "rubbing up" courses at subsequent dates, as, for instance, of physics and chemistry in the pathology period are advocated The theses and acts for M B and M D at Cambridge are held to be invaluable to the young graduate The debt of other sciences to medicine, research, comparative pathology, psychotherapy, general practice and preventive medicine and clinical practice are subjects which are also discussed by Allbutt

Needed Reforms in Medical Education—The main reforms needed in the medical curriculum in Newman's opinion are four 1 A lightening of the curriculum at both ends, in other words, fuller preparation in science before entrance to the medical school, and a postponement of instruction in certain specialities and in general practice to the postgraduate period in order to provide continued education of the qualified man—teaching which requires organization on the basis of professoriate, hospital, laboratory and clinical experience 2 A fuller study of the sciences preliminary to medicine and a nearer application of these subjects to clinical work Above all, there is great need of biology (anatomy and physiology) Its principles are the answer to many of our questionings It is the fundamental theme 3 Development of clinical teaching of university standard, particularly in relation to the beginnings of disease (the child and the outpatient), the science of prevention, the closed integration of various forms of clinical practice and of clinical with intermediate study, concentration on the protean diseases of tuberculosis, venereal malaria, malignant disease, and an understanding of the social side of therapeutics (environment, diet, occupation, and the use of physical agents), as well as the social aspects of disease 4 There is need of further state aid, though with a minimum of state control To provide a satisfactory medical education (*a*) we need more teachers better teachers, and better paid teachers, (*b*) we need clinical units, (*c*) we need improved laboratory accommodation and better equipment, (*d*) we also need an extension of hospital and clinic facilities for teaching The education of the medical man is no longer a proprietary or merely professional interest It is of national concern—for the health of the people is the principal asset of the state

Asiatic Cholera—On the basis of Braafladt's study, it would seem that (1) persons over 50 years of age contracting cholera have only a very small chance of recovering, even though they receive treatment, (2) that cholera is a more severe disease in women than in men, (3) that the prognosis is very good if proper treatment is commenced during the first day of the illness, (4) that hypertonic salt solution is the best form of treatment for those in severe collapse, but that it is harmful to those who have not yet developed many of the secondary symptoms, (5) that kaolin is the remedy of choice if the patient does not come under treatment too late

Exstrophy of Bladder, Implanting Ureters Into Rectum—A boy, aged 10 years, had a congenital exstrophy of the bladder The anterior wall of the bladder was absent Both ureters could be seen Each ureter, together with a rosette of mucous membrane, was stripped back for a distance of 2 inches The remainder of the bladder was dissected away The peritoneal cavity was not opened during the procedure Forceps were inserted into the rectum and on being passed through the rectal wall the ends of the ureters were seized and implanted into the two separate openings The day following the operation there was leakage from above The patient suffered considerable shock and died on the ninth day after operation

Soy Bean—The history and uses of the soy bean and its products in China are reviewed by Adolph and Kiang and the important relationship indicated which these food products bear to the Chinese dietary Soy bean curd is rich in protein, and contains those mineral constituents which are essential for growth Analyses are given of bean curd, bean milk, and the by-products obtained in their manufacture

*Two Cases of Paralysis Agitans Occurring Before Thirtieth Year E D Atkinson and C W Drought —p 72
*Central Pneumonia in a Child of Two H O Gunewardene —p 73

Shortcomings of Medical Curriculum.—Smith holds that the present curriculum is wasteful of the students' time because it gives what may be called a general introduction to the sciences, but leaves it to the later teachers or the students themselves to apply the principles and methods of these sciences in the various branches of medicine, whereas a continuity of teaching would concentrate intellectual effort and would thereby attain with much more certainty the standard of work which the curriculum is designed to reach Furthermore, the student of medicine should be trained in criticism, and for this all important part of his training the earlier sciences must assume a considerable part of the responsibility To be a good practitioner of medicine requires that the doctor must possess not only technical knowledge and skill, but also a broad sympathetic, tolerant conception of life To secure this nothing could be better than critical reflection on the fundamental conceptions by which the phenomena of life are interpreted

Psychoneurosis.—Bury regards it as likely that molecular disturbances of the nervous system and altered blood states largely account for the long duration of many cases of psychoneurosis and for the great tendency for symptoms to relapse on the slightest provocation whether that be undue exertion, loud sudden noises or family or business anxieties In the most common type of cases he believes that better results will be attained by fresh air, sunlight cheerful surroundings, and light work, than by continuous searching for a hidden mental conflict

Influence of Suggestion on Body Temperature.—Hadfield cites a case in which there was a very remarkable susceptibility on the part of the patient to suggestions of heat and cold, which was not purely subjective, but produced a rise and fall of temperature as measured by the thermometer

Treatment of Hookworm Infection.—The work of the Malaya board is reviewed by Darling It is recommended that communities in which the adults have an average of fifty or less worms do not urgently require treatment while those with more than fifty worms should be treated In carrying out treatment the two-treatment plan may be pursued, microscopists being dispensed with Every person in the group, excepting very young children, should be treated Persons ill with chronic nervous diseases may be treated with thymol or other vermicide Pregnancy and severe anemia are not contraindications to the administration of chenopodium The drug and dosage is chenopodium 1 5 c c, given in single or broken doses in hard gelatin capsules The preliminary purge before medication may be omitted but in this case the evening meal should be light and food then interdicted until after the postvermicidal purge, which may be given two to three hours after the exhibition of the chenopodium The postvermicidal purgation should be very thorough, for it is extremely important that the chenopodium being a neurotoxic drug with cumulative powers, should be as thoroughly expelled as the worms, and at the earliest possible moment after the drug has accomplished its purpose on the worms If permanent results are to be achieved prophylaxis as well as treatment of infection must be considered

Paralysis Agitans Before Thirty.—The cases cited by Atkinson and Drought are of interest not only on account of the unusually early age (30) but because both patients were soldiers in whom true paralysis agitans is very rarely seen

Central Pneumonia in Child.—The unusual features of Gunewardene's case are (1) that the crisis did not occur till the fourteenth day, (2) that the pneumonia was of the central variety and the physical signs of consolidation did not appear till the ninth day and (3) that the temperature was maintained at two levels during the course of the illness for about nine days between 103 5 and 104 5 F and for five days between 102 and 103 F the fall to the lower range suggests the crisis following the inflammation of the area of lung primarily involved masked by the fever due to the subsequent involvement of another area there is also apparent the so-called precritical rise before the arrested crisis The real crisis was a protracted one

Annales de Medecine, Paris

*Elimination of Hippuric Acid P L Violle —p 272
*Role of Fats in Nutrition F Maignon —p 280
Present Status of the Abderhalden Reaction Vitry —p 301

Primary Typhoid Phlebitis.—In the first of Etienne's three cases pain in the ankle was the first positive symptom after eight days of a slightly febrile temperature Phlebitis developed and at the sixth day the paratyphoid A bacillus was cultivated from the blood The phlebitis involved the femoral vein on both sides in turn the temperature showing waves of acute rises By the third month the blood was sterile but there was still some effusion in one knee six months after the first symptoms In the second case the phlebitis developed the third day after the sudden onset of intense headache and malaise The phlebitis assumed the form of phlegmasia alba dolens and involved both legs The subacute disease progressed with the picture of general septicemia with sero agglutination of typhoid bacilli but no signs of actual typhoid fever the man of 56 dying in a little less than a month after the first symptoms In the third case the phlebitis was the first sign of pathologic conditions Then the temperature rose and the phlebitis spread to the other leg with subjaundice the low fever dropping by lysis the third month The serum agglutinated the typhoid bacillus at 1 80 and the paratyphoid bacilli at 1 40 and 1 30 Etienne does not know of any analogous cases on record

Elimination of Hippuric Acid.—Violle shows that the amount of hippuric acid eliminated varies with the diet and the state of the kidneys When the latter are diseased very little hippuric acid is eliminated hence systematic examination of the hippuric acid output from time to time on a given diet including green vegetables and fruits to supply the benzoic acid from which the hippuric acid is formed affords insight into the functional capacity of the latter

Rôle of Fats in Nutrition.—Maignon shows how new facts recently learned have thrown light on the fats as potent modifiers of nutrition in addition to their role as food His personal research has apparently demonstrated that fats do not serve in the production of glycogen in mammals, hence their usefulness in diabetes But they aid in the utilization of the proteins in the food reducing the toxicity and increasing the nutritional value The practical lesson from this is that fats are needed medicinally in all disturbances of nitrogen metabolism and to aid the protein synthesis in growing children He explains the reasons why with menace of coma in diabetes the rational treatment is to give fats in the place of most of the carbohydrates of the diet, the protein in the diet should be reduced to the maintenance minimum The fats should be in an assimilable form such as emulsified and partially saponified oil With this treatment none of his diabetic patients have developed coma although some of them were very grave cases of lean diabetes with intense glycosuria and acetonuria and extreme nitrogen denutrition The same treatment applies also to chronic autointoxication from defective utilization of proteins as in eczema and rheumatismal conditions He has obtained positive results in some dogs with eczema Two conditions are indispensable he reiterates namely that the fats must be given not as a supplement but in place of other foods so that the organism will be obliged to utilize them and not store them up as adipose tissue reserves This can be kept under control by repeated weighing The other condition [illegible] must be kept acid with sodium bicarbonate to overcome the acidity of the urine and hypoalkalinity of the blood he ascribes the cause of aceto[illegible]

*Treatment of Jaundice P E Weil —p 533
Gastro Intestinal Disturbance in Children of Rhinopharyngeal Origin A Malherbe —p 535

Sugar and Hexamethylenamin in Jaundice—Weil gives systematically daily by the drop method by the rectum 15 gm of hexamethylenamin in a solution of sugar 45 gm to 1 liter of boiled water in all kinds of acute infections except dysentery He applies it as a daily routine measure from the start All that we know, he says, of liver physiology supports this treatment theoretically and experience is confirming it in practice Sometimes he adds a little epinephrin This treatment is more active than infusion by the vein or subcutaneously of the sugar solution It stimulates the liver and kidneys and induces intense diuresis, while the sugar promotes production of glycogen and elimination of nitrogenous waste, and starts a more profuse flow of bile He uses sugar instead of glucose as more readily available, and is not certain whether the hexamethylenamin might not be dispensed with This treatment may transform conditions with jaundice from gallstones so that operative measures may become unnecessary It fails of course when the jaundice is the result of cirrhosis or neoplasms

*Indications for and against Nephrectomy F Legueu —p 1
*Chronic Disease of Seminal Vesicles G Marion —p 11
The Oscillometer as Aid in Urologic Surgery G Jeanneney —p 19
New Case of Spontaneous Rupture of Renal Artery Saint Cene —p 25
*Paresis of Bladder Cured by Borated Glycerin Corbineau —p 31

Indications for and Against Nephrectomy—Legueu relates that thirteen of his 1,008 nephrectomies before 1920 are too recent for decision as to the outcome Of the 437 others since 1915, in 250 the nephrectomy was done on the findings with catheterization of the ureters, and in 187 on the findings of the Ambard ureosecretory index With the latter below 0 100 the mortality was 3 6 per cent , above 0 100, the mortality was 10 per cent With catheterization alone, the mortality was 3 20 per cent His experience all speaks in favor of the Ambard index as being a reliable guide alone, especially when it is below 0 100 The higher the constant the greater the risk The risk is highest when the nephrectomized kidney has been doing part of the work. When the remaining kidney has been doing all the work, the removal of the useless kidney does not affect the total output With a constant below 0 100 the disease was invariably restricted to one side in his experience But the constant does not tell which side, for this, catheterization may be necessary unless the diseased kidney can be located otherwise

Vesiculitis with Prostate Disease—In Marion's three cases the dysuria of prostatic origin was accompanied by inflammatory processes in the seminal vesicles, and in each case the prostate was the seat of a cancer In one, the prostate seemed to be merely smoothly enlarged except that the seminal vesicles could be palpated, tender and dough This should suggest the possibility of malignant disease unless there is evidence of ordinary chronic prostatitis The vesicles in each case were knobby and dilated as if the outlet to their secretions had been blocked by the neoplasm They were the source probably of the violent pains experienced, and the removal of the vesicles with the prostate did not seem to render the prognosis graver

Borated Glycerin in Paresis of the Bladder—Corbineau reports two cases which sustain the general impression that boric acid has a stimulating action on the muscle fibers of the bladder He injected it without first emptying the bladder, injecting 30 c c directly into the meatus without a catheter This small amount was enough in both cases for the patient to regain functional control of the bladder in fifteen or thirty minutes He used a 10 per cent solution of the boric acid

Radium Therapy of Cancer of Uterine Cervix S Fabre—p 546
*Carbon Dioxid Snow in Skin Disease L Lortat Jacob—p 552

Recent Acquisitions in Electroradiology—Zimmern cites with approval Renon's appeal for roentgen-ray examination twice a year of persons with disease of the respiratory apparatus, to follow the evolution of their disease by keeping a radiologic record He says that Rist's assertion that a normal lung gives a normal roentgen-ray picture has been proved too absolute by experiences with tubercle bacilli in the sputum when the roentgen-ray picture was quite normal Mantoux has also demonstrated that a necrosed scrap of lung may not cast any shadow Zimmern himself regards as of real value only the positive signs The pneumoperitoneum represents progress, he ascribes the priority to Killing in 1902, and says that to date no mishaps have been reported with it He adds 'The Americans introduced into France during the war high tension apparatus to use with the Coolidge tube as in industrial electricity Schearer in 1917 had pointed out the possible dangers from this and the death of the Paris radiologist, Dr Jaugeas sadly confirmed the justness of his warning The Societe de Radiologie medicale de France has now taken up the question of means for protecting the radiologist and the subject against the high tension circuit and numerous methods have been proposed But there is only one that is absolutely effectual That is, to have all the high tension apparatus in a cage on the ground the opening of the cage automatically breaking the circuit'

Roentgen-Ray Treatment of Pituitary Tumors—Beclere insists that in the constantly widening sphere of radiotherapy, the treatment of pituitary tumors with the roentgen rays is one of the most valuable acquisitions With it he has succeeded in curing the headache vertigo, nausea and vomiting, vision is improved more the earlier the treatment is begun and the changes in the bones are arrested These results have persisted for over six years to date in one case for eleven years One girl of 16 with exaggerated growth, obesity and genital infantilism with enlargement of the sella turcica and signs of intracranial pressure and impairment of vision was so improved by the roentgen-ray exposures that the obesity subsided, and ovarian functioning and the secondary sexual characters developed normally thereafter He exposes different fields on the skull not through the mouth

Roentgen-Ray Treatment of Exophthalmic Goiter—Cottenot says that since he has been using large doses with thick filters, he has been obtaining very fine results in the typical cases with the complete set of symptoms The nervous and heart symptoms are those which show the greatest improvement the tremor subsiding with the restlessness The goiter itself and the exophthalmos are modified least and last The functional disturbances thus are improved or cured, but the objective are more tenacious

Carbon Dioxid Snow in Treatment of Skin Diseases—Lortat-Jacob reviews the experiences in different countries with this cryotherapy or cryocauterization as he calls it showing its success in many forms of dermatoses its absolute harmlessness and its efficacy in many cases refractory to all other measures

*Infectious Diseases in 1920 C Dopter—p 449
Clinical Diagnosis of Typhus J Rieux—p 461
The Influenza Virus R Dujarric de la Riviere—p 466
Atypical Bacilli in Bacillary Dysentery J Dumas—p 470
*Spinal Fluid in Lethargic Encephalitis R Benard—p 474

Infectious Diseases in 1920—Dopter reviews the field of infectious diseases describing the most important acquisitions gained during the last five years Among them is the practice of injecting meningococcus antiserum directly into the ventricle at the first suspicion of ependymitis Sicard and his co-workers have even rinsed out the meningeal cavities by a kind of spine-ventricle lavage Boidin Florand and Merv have each reported excellent results from bacteriotherapy associated or not with an abscess of fixation in cases refractory to serotherapy as also Colard Sergent and Bordet with microbian injections by the vein He says of the agglutination of *Proteus* X in typhus that every normal serum contains traces of agglutinins for *Proteus* but the serum of typhus patients contains something that reenforces the normal agglutinins and thus ensures the typical reaction It occurs only in typhus although the proteus certainly has *nothing to do with the causation of typhus* Serotherapy of iceterohemorrhagic spirochetosis has given most encouraging results in the hands of Martin and Pettit, when given in the first days of the disease it may arrest it Dopter relates that Levaditi and Harvier have apparently established by the identical histologic lesions induced in rabbits by inoculation of an emulsion of brain substance from human cases of epidemic encephalitis, that the virus is filtrable cannot be cultivated on ordinary mediums, and is essentially different from the virus of poliomyelitis and is not neutralized by convalescents' serum In conclusion he refers to Noguchi's *Leptospira icteroides* as one of the finest bacteriologic discoveries of our epoch if his statements are confirmed In spite of the flood of literature on influenza, no new acquisition can be cited

The Spinal Fluid in Epidemic Encephalitis—Benard remarks that although the cerebrospinal fluid may be absolutely normal yet this seems to be the exception in the last few months of the present epidemic Lymphocytosis is common but the fluid is always clear, there may or may not be albumin and glucose is not constant but the latter is so frequent that a glucose content of from 0 67 to 1 06 gm is a material aid in the diagnosis The urea content is normal unless there is uremia No specific biologic reaction has been discovered yet

*Voluntary Apnea Test L Binet and M Bourgeois—p 381
Fasting Stomach Content L Pron—p 381
Degeneration of Lenticular Nucleus P L Marie—p 384

Voluntary Apnea Test—Binet and Bourgeois recalls that the functional reserves of heart, kidney and lungs can be estimated by the length of time a person can hold his breath after a deep inspiration Two myxedematous patients were able to hold their breath for 90 and 110 seconds, with chronic bronchitis and pulmonary emphysema the apnea could be kept up only for 21 seconds with pulmonary tuberculosis even those with slight lesions the average was 14 seconds with well compensated heart disease 34 seconds and with failing compensation 19 The latter figure was also the average with kidney disease uremia and high blood pressure The findings with this test do not parallel those of the vital capacity but throw light on the degree of impairment of respiratory functioning

Fasting Stomach Content—A previous communication from Pron on this subject was reviewed June 19 1920 p 1745 He argues to prove the greater diagnostic value of investigating the stomach content fasting rather than after a test meal With the latter a pure mucous catarrh e capes detection as also microretention filtering yields an incomplete conten the tint of the chyme masks any pathologic tint and the slow or rapid rate of gastric secretion may mislead as to the total secretion when examined an hour after the test meal In short he declares cancer is the only pathologic condition in the stomach in which the diagnosis is aided by analysis after the test meal and even with this we must not forget that achlorhydria may be encountered sometimes even in the elderly with nonmalignant conditions

On the other hand analysis of the fasting stomach con ent differentiates frank dyspepsia from dyspep ia secondary to liver disease by the pure bile in he stomach With an ulcer the test meal findings are merely those of ord nary hyper chlorhydria while the finding fastin, of a m d ra e o il and hydrochloric acidity (for e mpl) is highly instructive and l

cedure is applied After extraction of the stomach content and obtaining a negative Adler reaction, he pours through the stomach tube 200 c c of a 1 per cent solution of acetic acid Waiting for a few seconds then aspirating it and testing for the hematin crystals which are constantly present on every ulcerating surface, clinches the diagnosis of gastric ulcer The fasting stomach content also reveals continuous hypersecretion when the clinical findings otherwise may suggest merely hyperchlorhydria or possibly—from the delayed evacuation, dilatation and atony of the stomach—hypochlorhydria It may also clear up the diagnosis of some serious stomach condition when there are no decided symptoms but only a bad general condition, lassitude and vague stomach malaise In one man who weighed 44 kg and ate at will and had never had vomiting nor pain nor heartburn the fasting splash, hypersecretion and positive Adler test first revealed the old ulcer

*Medical Treatment of Amebic Liver Abscess T Pontano —p 607 Concluded
*Lymphosarcomatosis C Zoli —p 615

Efficacy of Emetin Treatment of Amebic Liver Abscess—Pontano argues that what Rogers calls the presuppuration stage of amebic liver disease—during which alone, the latter says medical measures are effectual—is in reality the stage of the established abscess Hence it follows that medical measures are effectual at any stage, and Pontano's experience in ten cases has demonstrated this to be a fact Not one of his ten patients has had any recurrence during the year or more since to date of writing In eight of the cases the diagnosis was confirmed by exploratory puncture He adds that the ameba may not be found in the stools or puncture fluid, but the microscopic aspect of the latter is sufficient to diagnose the abscess by the albumin cell detritus, scanty degenerated cells, erythrocytes, fat droplets and crystals of fatty acids, even without true pus Emetin injected intramuscularly, from 0 09 to 0 15 gm daily for three days, is the rule, two courses the first month, then one course a month for eight or nine months He gives a mild purge before each course, and sometimes gives a decoction of ipecacuanha by the rectum The dysentery may flare up at first, this should not modify the treatment, but the pulse and respiration must be supervised, stopping the drug on signs of intolerance It arrests the necrotic process, and the contents of the abscess are gradually resorbed He warns, however, that if secondary infection is transforming the products of the abscess to true pus, surgical measures are indispensable But otherwise, neither the gravity of the abscess, its size or its age contraindicates exclusive medical emetin treatment This acts on the dysentery itself and on multiple abscesses Amebic abscess of the liver belongs to medical therapeutics as much as syphilitic disease of the liver

Lymphosarcomatosis—Zoli calls attention to the fact that the primary lesion in the case reported was in the inguinal glands and the malignant disease might have been exterminated if the groin focus had been excised in time

May 15 1920 **67**, No 3466

Case of Associated Scurvy and Beriberi G Garcia Urdiales—p 361

Fractioned Analysis of the Stomach Content—Saenz leaves the stomach tube in place for an hour or longer and examines the stomach content at intervals He uses a tube 75 cm long and 6 mm in diameter, with a fenestrated olive that weighs 8 gm The outer end of the tube lies between the teeth and the cheek and the patient can read and talk He aspirates the stomach content every fifteen minutes until no more can be obtained by aspiration with the subject on his back, side or in the knee-chest position Between each aspiration he rinses the syringe and injects air Acidity, fasting of over 1 per thousand he regards as a sign of stomach disease His experience confirms that gastric pain is due to exaggerated peristalsis rather than to hyperacidity With gallstones, there is usually hyperacidity in the young while in the elderly the tendency is to achylia or hypochylia, the stomach otherwise normal

Identity of Hyperchlorhydria and Peptic Ulcer—Gonzalez argues that the clinical picture of hyperchlorhydria is probably from an already established ulcer Fully 66 25 per cent of dyspeptics in his experience in Spain have hyperchlorhydria He noted hyperchlorhydria in 96 2 per cent of 715 positive cases of gastric ulcer, only 2 09 per cent having normal gastric chemistry The acidity with ulcer need not be very high An excess of acid does no harm with normal stomach walls, some solution of continuity is necessary before there can be corrosion The pain from the ulcer is probably due to this corrosive action and not to excessive peristalsis He has witnessed extreme peristalsis during roentgenoscopy, without pain while in other cases the pain was intense when this revealed no peristalsis The fact that the treatment which cures ulcer cures also hyperchlorhydria is a still further argument in favor of their identity He cites from the literature considerable data which he thinks, sustain this view

Mercury Lamp plus Silver Nitrate in Dermatoses K Schindler—p 127
Treatment of Furuncles K Weigert—p 128
Syphilis and the General Practitioner M Josephi—p 130

Azurophil Inclusion Bodies in Erythrocytes—Walterhöfer states that the pathologic significance of inclusion bodies in erythrocytes lies not so much in the presence of the bodies within the cell structure as the fact that erythrocytes containing them appear in the peripheral circulation No matter how much the shape and the staining properties of these inclusions may vary they are always traceable to some reaction in the bone marrow with exaggerated production of new red corpuscles It is only in these new red blood cells that the azurophil inclusions are found He remarks in conclusion that when the observer realizes that the different forms of these azurophil inclusions represent merely different stages of the process of extruding the nucleus of the erythrocyte, the ring bodies and dots are less bewildering The ring bodies and dots display identical staining properties and addition of an alkali facilitates the process These inclusions occur more frequently than has hitherto been recognized. He describes in detail three cases of pernicious anemia in which they were found in large numbers and over long periods The inclusions found in malaria and in various poisonings have nothing to do with these developmental processes of the red corpuscles they originate in the corpuscles already in the blood stream They are the direct expression of the effects of certain definite injuries and aid in the diagnosis of the nature of the injuries

Nervous and Psychic Disturbances Following Inoculation Against Rabies—Hubner reports several cases in which physical and mental disturbances followed injection of antirabic serum One man of 27 was bitten by a dog and although there was no evidence of rabies, he received eighteen prophylactic injections of antirabic serum The last day he received two injections as he was leaving the city On the journey home he felt formication in the right side of the face and six hours later right facial paralysis developed, and five days later the same on the left side, with pains in the right ear Opening the jaws was painful, and frontal and occipital headache was present and pain in the back at time testifying to neuritis of the cerebral and certain peripheral nerves with a certain amount of psychic disturbance In three months he seemed to have quite recovered and had resumed work Nothing else was known to explain the facial diplegia, rabies itself, Hubner thinks can be definitely excluded in the case In eight other cases he noted weakness and psychic changes after antirabies treatment His experience thus warns that antirabies treatment is liable to temporarily incapacitate to some extent for regular work and responsibility

Pneumoperitoneum in Roentgenology of the Liver—Rautenberg discusses in connection with seven cases the liver defects that are revealed by raying after injection of air or oxygen into the abdominal cavity comparing the clinical with the necropsy findings As regards the indications for the pneumoperitoneum he emphasizes that they are quite limited and that the discomfort of the procedure for the patient must be weighed and compared with the expected gain from a diagnostic standpoint It is not a question whether this method aids in the diagnosis but whether we have exhausted all other clinical means of diagnosis and what more can be reasonably expected from the pneumoperitoneum method

The Relation of the Hydrochloric Acid of the Stomach to Pepsin—Michaelis says that pepsin in order to develop its highest degree of efficiency must have a very high acidity to work in irrespective as to whether this degree of acidity furnishes the most favorable conditions for the absorption of water by the protein to be digested It is simply a wise provision of Nature that the optimal acidity for the action of pepsin coincides with the optimal conditions for easy absorption by the ordinary food proteins

*Test Alimentary Glycemia A Frank and Lotte Mehlhorn —p 313
*Chlorin Content of Infants Blood Serum K Scheer —p 347
*Pathogenesis and Treatment of Enuresis A Pese —p 357
Congenital Atresia of the Duodenum C Ritter —p 369

Alimentary Glycemia Test—Frank and Mehlhorn report the results of thirty-seven different sets of tests on young children In some of the tests 8 gm of cane sugar per kilogram were given the child fasting and the blood was examined for sugar every half hour Pronounced hyperglycemia followed in every instance and persisted for several hours The same was noted with starch given in the same way but casein and fat did not cause any change in the sugar content of the blood With the sugar tests, there was always glycosuria, but not with starch Starch seems to render the kidney filter less permeable for sugar

The Chlorin Content of the Blood in Infants—Scheer refers to the chlorin level in the serum and its dependence on the secretion of gastric juice That is, during digestion the chlorin content of the serum rapidly declines, but rises again after the stomach is emptied

Enuresis—Pese says that enuresis nocturna seemed to become more prevalent during the war, at the children's asylum at Breslau 30 per cent of all the small children and 10 per cent of the older children were subject to it He made a prolonged study of twenty-three small children and eleven older children and became convinced that enuresis is of two types the symptomatic, and the enuresis connected with the depth of the slumber This latter form is characterized by its persistence from birth, with slight if any intermissions, the frequent coincidence with constipation, and the fact that therapeutic suggestion has no influence on it Sedatives aggravate the enuresis, but it can be cured usually by waking the child at intervals before he gets too sound asleep, plus restriction of intake of fluids after midday Symptomatic enuresis is amenable sooner or later to therapeutic suggestion but this type may be combined with the "deep sleep type"

Toxicity of Arsphenamin—Taege reports a case in which 3 3 gm of neo-arsphenamin were self-administered in large doses (0 6 to 0 9 gm) in five days The results were transient fever 104 F, rapid pulse palpitation, sense of oppression nausea, and vomiting (once only) Over the surface of the body, including soles of the feet and the palms of the hands was a bright red eruption, with small spots, itching slightly Taege recommended increased fluid intake and sweating procedures The question is how the patient could bear such large quantities of arsphenamin without great harm resulting whereas, in other cases, very much smaller quantities have had a serious or fatal effect Does the body in disease react differently to arsphenamin than in health? Or is congenital hyposensibility to arsphenamin sometimes present, although its existence is usually denied? The patient in this case was a young physician whose assumption of syphilis following exposure proved later to be erroneous, so his self-dosing was superfluous

Case of Pure Tetragenus Meningitis M van Riemsdijk —p 1445

Mucocele of the Sphenoid Sinus—Van der Hoeve tabulates the data of eight cases he has found on record and compares them with one personally observed In the total nine cases one eye was blinded and in three other cases the other eye was threatened The diagnosis had not been made before the operation in any case the roentgen-ray findings are deceptive Treatment can be only operative, best by way of the nose Fluctuations in the fluid content of the mucocele were evidently responsible for the variability of the clinical picture The data presented confirm the dictum that when vision is becoming impaired and no cause for this can be discovered, the nasal sinuses should be opened up This may reveal a mucocele or empyema which otherwise may speedily entail blindness In a recent case although a little pus was found in the nose investigation through the nose of the nasal sinuses failed to disclose any focus and the patient became blind in a few days from retrobulbar neuritis Finally, opening the posterior sinus cavity revealed a large amount of pus on one side and a little on the other This shows hat even the rhinologist, with the aid of the roentgen rays, is not always able to detect sinus mischief without an exploratory opening up of the sinuses

High Blood Pressure and the Ambard Constant.—Lankhout gives the details of age, blood pressure, urea content of the blood and the Ambard ureosecretory index in twelve cases and emphasizes that a high blood pressure in itself is not usually a serious matter The prognosis depends on the complications in kidneys, heart and nervous system, and we are unable to estimate these until they are quite pronounced The Ambard constant does not help here We have no grounds for the assumption that the high blood pressure is always secondary to heart kidney or vascular disease It has no more significance than the discovery of a murmur or hardening of a normally soft organ Because we can measure the blood pressure we have paid too much attention to it and hidden our ignorance behind the term "essential hypertension The rise in blood pressure is merely one element of a morbid series which has to be regarded as a whole

The Duodenal Tube—Summarized July 3, p 72

Cholelithiasis and Achylia—Rydgaard reports a new instance of the connection between gallstone disease and achylia Rovsing found the gallbladder full of stones in doing splenectomy on a woman of 65, but did not molest the gallbladder at the time Test meal findings showed achylia or hypochylia Four years later the gallbladder had been entirely destroyed functionally, but the gastric secretion was practically normal This apparently contradicted Rovsing's assertions that achylia is almost inevitable when the cystic duct is totally obstructed Necropsy revealed that the common bile duct had dilated until it had formed a new gallbladder In a recent compilation of eighteen cases of total obstruction of the gallbladder in subjects under 50, Rydgaard found achylia or hypochylia in 83 per cent , in 52 per cent in thirty-two in which the cystic duct alone was impermeable and in 27 per cent in seven in which the gallbladder alone was shut off

THE RÔLE OF DEEP ALCOHOL INJECTIONS IN THE TREATMENT OF TRIGEMINAL NEURALGIA *

HARVEY CUSHING, M D

BOSTON

The injection of the nerves with some tissue fixative as a means of controlling neuralgias, particularly those of the face, is an old story [1] and various substances have been used for this purpose, chloroform introduced by Bartholow in 1874 being possibly one of the first used and first abandoned Osmic acid, proposed by Billroth and Neuber in 1884, then had its period of popularity, and the injections were first made into the foramina of exit of the nerves from the facial bones The results were too transitory to give the procedure a very lasting place in surgery

An improvement on these methods, with much more satisfactory results, was introduced in 1902 in France by Pitres and Verger,[2] and in 1903 by Schlosser [3] in Germany, in the form of deep injections of the nerves near their foramina of exit from the skull—the foramen ovale and rotundum It was impossible without too great risk of damage to neighboring structures to reach the ophthalmic division in this way, but as the pain in far and away the larger number of cases originates in the territory of the maxillary and mandibular divisions, this was of no great moment

The method, further developed by Ostwald, and by Levy and Badoin, reached this country the following year (1907) and was largely popularized through articles by Hauck,[4] Hugh T Patrick,[5] Hecht,[6] and Kiliani,[7] and there can be no question but that an immense number of needless peripheral operations have thereby been avoided, for the relief from a successful injection should be as enduring as that following a peripheral neurectomy The popularity with which this procedure was received is evidenced by the fact that during the six years after his original Sammel-Referate, Flesch [8] collected from the literature ninety additional titles

The procedure has its limitations as all know The relief is but temporary and with each successive injection a shorter interval of freedom from pain is apt to be secured This, however, is true of peripheral operations as well, which in the hands of the inexpert may leave very unsightly scars on the face but, on the other hand misplaced alcohol injections may do damage far worse than leaving unsightly scars

Examples of most distressing after-results of these cases have appeared from time to time in our clinic—such complications as one rarely sees in the present day after a ganglion operation Paralysis of the oculomotor nerves is one of the commonest Locking of the jaw from infiltration, and subsequent fibrosis of the pterygoid muscles is another frequent occurrence Paralysis of the motor fifth is usual after injection of the mandibular division, and function may not be regained Sloughs of the nasal bones with subsequent ozena have been reported and some of the intranasal injections have been followed by critical secondary hemorrhages Certainly there is every reason to decry the intranasal injections as practiced by rhinologists for, as has been pointed out, if there is any reason to inject Meckel's ganglion, it can be reached far more safely by the usual method through the cheek than through the nose For some unaccountable reason, facial paralysis is not uncommon, whether purposeful or accidental is not entirely clear Four patients in my series presented themselves for a gasserian operation with a complete facial paralysis due to preceding injections and, as might have been expected, both of them subsequently had a corneal ulcer Two of them had been injected by the same physician, but I did not venture to make inquiries regarding the procedure employed, though I surmised that the injection into the seventh nerve was intentional

But if these complications are lamentable, still more distressing are the examples of labyrinthine trouble due to the accidental injection into the middle ear The eustachian tube is but a few millimeters from the mandibular branch, at the foramen ovale and if sufficient local anesthetic is added to the alcoholic solution to render the mucous membranes insensitive, the middle ear may become filled with alcohol and a slough result The following story is not an exceptional one

In 1905 a woman then 33 years of age began having paroxysmal pain in her left lower jaw and teeth Three were extracted without relief Six deep alcohol injections were

given by her brother, a physician, in the attempt to reach the mandibular division During the course of the last she became suddenly dizzy and deaf and for some days was extremely ill, with vomiting and vertigo The drum ruptured and a profuse discharge occurred

She has suffered from dizziness and tinnitus for the subsequent fourteen years, and the middle ear has never healed despite two radical operations She still has a bad third divisional neuralgia, but the labyrinthine disturbance so far outweighs this that she bears this lesser torment with stoicism

It is possible that my impressions of the sorry consequences of deep injections are exaggerated for the reason that the bad results of these measures are likely to gravitate in the course of time to a clinic where the gasserian operation is frequently performed But I must confess that I never give an alcohol injection myself without misgivings never use a general anesthetic for the purpose, and never force the injection unless absolutely sure that the needle is in proximity to the main nerve trunk Under these circumstances but a very small amount of alcohol is needed, and in the series, which is a long one, there has been only a single complication—an abducens palsy which ultimately was recovered from

So far the balance would appear to weigh distinctly in favor of the simple measure—the injection—if carried out by practiced hands directed by the capacity to visualize deep anatomic structures This is more or less of a gift, and there are no rules to follow One introduces the needle to the nerve, and it is difficult to see how the eustachian catheter and the fluoroscope, as suggested by Pollock and Potter,[9] can do more than complicate a procedure whose simple rules were laid down ten years ago and which merely depends on a working knowledge of the deep anatomy of the head

But at best, even in cases of minor neuralgia the procedure must be often repeated and most observers agree that nine months of relief represents about the average duration Flesch[8] reported 262 injections in eighty patients, 102 owing to recurrence, and Patrick[10] in 1911 recorded a series of 500 deep injections (second and third divisions) in 150 patients Dr Patrick, who has had as large an experience as any one with these procedures, stated at that time that the results were "good" (successful) in about 30 per cent, "partially successful" in about 43 per cent, and "misses" (unsuccessful) in about 26 per cent He also stated that in only 18 per cent of cases could the first attempt at either branch be regarded as successful

Unquestionably the repetition of injections may be greatly overdone In an earlier section of this address,[11] a clinical history was given of a young woman who had sixty-two deep injections in the four years before her trigeminal neurectomy was performed The following case history tells a similar story

Gasserian Series 311 *Surg No* 10250 *A three-divisional neuralgia of many years duration Repeated alcohol injections for last twelve years Gasserian operation with preservation of motor root*

A woman, aged 72, began having neuralgia in the maxillary division in 1895, twenty-four years before her admission The early paroxysms were limited to the cheek and lip on the left side They were of increasing frequency About a year later they suddenly changed in character and spread over the entire left side of the face and scalp The pain, invariably paroxysmal in character would be initiated by touching the skin of the face or hair, or the insertion of food in the mouth

Attempts were made to control the early attacks with morphin without success The patient had a series of very severe attacks in 1897 and this experience was repeated for the next nine years In her worst year she was practically bedridden for eight months

Matters dragged on until 1907, when she had her first alcohol injection with relief for sixteen months Since that time, whenever an attack has appeared she has had both the second and third divisions injected, but the procedure has been increasingly inefficient All told, deep injections have been given during the last ten years on forty-seven different occasions On admission the entire left trigeminal area, including the tongue, was involved in the paroxysms

Her gasserian operation was performed, April 5, 1919 The sensory root was avulsed and the motor root preserved Total sensory anesthesia has resulted, and one may be confident that the result will be permanent She would have been spared much suffering has this been done ten—indeed twenty—years before

There are certain major types of neuralgia often, as in the case of this patient, with early involvement of all three divisions, which are incompletely if at all relieved by these deep extracranial injections, and some neurologists have ventured to go farther in the effort to inject the ganglion itself It is quite probable that those who have given a large number of deep injections for neuralgia may have occasionally observed that the subsequent anesthesia had spread beyond the limit of the distribution of the trunk, primarily the object of attack The following is an account taken from the hospital note of my first experience

P B B H Surg No 2624 *Deep injection of mandibular division with unexpected spread through gasserian envelops*

Mr F S R aged 40, had had an involvement of the right third division of six years' duration I had made an unsatisfactory attempt to give him a deep injection in 1911 without the production of anesthesia and he had had a number of subsequent attempts elsewhere with no better results

March 13 1915 *Accidental injection of ganglion* On slowly inserting the needle in the direction of the foramen ovale to a depth of about 4 5 cm, it encountered a dense resistance, like cartilage which made me fear that it might have reached the eustachian tube During the insertion the patient complained more than usual of local discomforts (of pressure deep in the cheek) but had experienced no pain in the area of distribution of the third division

It was anticipated that the injection would meet with considerable resistance on the part of the tissues but to my surprise the first drop or two went in without any resistance whatever After a moment's delay to determine the effect, the patient suddenly said "My tongue and lip are getting numb," and then very shortly "My face is numb" No especial attention was paid to this, except that it was gratifying to realize that the nerve had actually been struck

During the next five minutes less than half a cubic centimeter of the solution was introduced, when to my astonishment he said "Why the whole half of my head is numb, tongue and all"

This proved to be the case on examination—anesthesia of all three divisions with loss of the corneal reflex with deflection of the jaw to the right on opening the mouth The patient complained of feeling somewhat dizzy and a little nauseated, and it was observed that there was a very marked nystagmus to the left side—none to the right The quick component was to the left with a slow return, but the jerks were very rapid On looking to the left and on looking upward there was a slight rotary movement

11 Cushing Harvey Am J M Sc to be published

It was surmised that the arachnoid sheath passed down from the ganglion farther than usual along the third division in this patient, and that the fluid had run up and filled the subarachnoid space enclosing the ganglion itself If this was actually what occurred, it may happen under these circumstances in other cases This hazard is the strongest argument against the purposeful injection of the ganglion, for if alcohol should happen to get into the arachnoid spaces around the ganglion it would easily pass into the lateral recess of the posterior fossa

The late reports from this patient show, in spite of the very small amount of alcohol which was introduced, that the second and third divisions including the motor fibers remain completely paralyzed, and there has been no return of pain after nearly five years If the danger of ganglion injections could be eliminated and if they cou'd be followed by such a good result as this, the surgery of the gasserian would fall into desuetude, but this unfortunately is not the case

Any one who is familiar with the appearance of the ganglion in the living, bathed as it is with cerebrospinal fluid, would be terror stricken at the idea of blindly injecting alcohol into its arachnoid capsule The proposal doubtless took its origin in Heinrich Braun's procedure of blocking the ganglion by the injection of a local anesthetic to produce regional anesthesia for operative purposes But the introduction of a local anesthetic is a far different thing from introducing a tissue fixative It is difficult to believe that a procedure fraught with so many possibilities of disaster could have been seriously advocated

First proposed in 1912 by Hartel [12] of Bier's clinic, and introduced in this country by Grinker,[13] the measure has been taken up by many, and considering the fact that the results at best are with rare exceptions little better than after extracranial injections and that the complications are as bad if not worse than those seen after imperfect gasserian operations in their worst days, it is certainly time for someone to protest at this blind procedure In the matter of secondary keratitis alone Flesch [8] from his review of the cases believes that 50 per cent have suffered from eye troubles Hartel not only reports a case of meningitis, but has admitted to corneal complications in one in every four (25 per cent) of his first twenty-four cases, whereas certainly not one in ten patients after a sensory root avulsion has any subsequent trouble with the eye

Flesch mentions among the complications, vomiting, fainting, brachycardia, somnolence, ataxia, collapse, severe headache, fever (40 per cent of cases), stiffness of the neck cloudiness with increased tension of the cerebrospinal fluid—a so-called aseptic meningitis Hartel himself warns against the possibility of the mordant entering the lateral system of the posterior fossa

Some months ago a letter from which the following is a quotation was received from an English surgeon

> You will remember that I spoke to you about a young girl who was suffering from trigeminal neuralgia and who had the ganglion injected with alcohol by a well-known neurologist I do not know whether I told you that the alcohol overflowed from the ganglion with the result that the abducens and facial nerves were paralyzed and from the symptoms it is evident that the auditory had also been affected as the patient suffered much from giddiness I understand from her medical attendant that while the paralysis of the sixth and seventh nerves is being recovered from, the neuralgia is unfortunately returning I should mention too that there was some ulceration of the cornea which has left a distinct opacity Her medical attendant has just written to me to say that both he and the neurologist have come to the conclusion that an operation must now be performed for the purpose of dividing the sensory root

This girl aged 22 after three years of neuralgia was finally brought here about six months later and I have rarely seen a neuralgic of advanced years in such a desperate condition and not alone from pain and drugs For she had such extreme vertigo she could not raise her head there was an abducens and facial paralysis a trophic ulcer of the cornea, and she was reduced to 87 pounds weight

Enough has been said about these injection methods and their consequences They have been a great boon to innumerable cases of minor neuralgia when given with proper precautions and in certain cases of major neuralgia of obscure and uncertain type they are of value as a means of certifying the nature of the neuralgia by the brief period of relief which may ensue

Certainly in the major neuralgias true to type it is procrastination to use them and when carried to the point of injecting the ganglion itself, the recorded complications are so much worse than any complications which one sees at present after a gasserian operation that there can be no choice in the matter This is particularly so in view of the permanence of relief after the neurectomy and a relief of uncertain period even after a successful and uncomplicated ganglion injection

CONCLUSIONS

1 Deep extracranial injections of alcohol into the maxillary and mandibular nerve trunks near their foramina of exit from the skull have completely superseded *peripheral neurectomies*

2 In neuralgias limited to one of the two lower divisions and which may possibly not extend into the other trigeminal areas alcohol injections represent unquestionably the treatment of choice

3 When the neuralgia has spread beyond its original area and come to involve that supplied by the adjacent division, a trigeminal neurectomy must be contemplated, but if *no preceding deep injection* has been given it may be useful not only in insuring the type of the neuralgia but in giving the patient some warning as to what the numbness resulting from the neurectomy may amount to

4 They are sometimes useful furthermore, in determining in doubtful cases whether the syndrome is a true neuralgia of the tic douloureux type or one of the peculiar and rare pseudoneuralgias not amenable to relief either by injections or neurectomies

5 Even the extracranial injections are not entirely free from risk and in no cases *should they be purposefully* pushed to the point of attempting an injection of the gasserian sheath itself

6 With such perfect and permanent results as may be secured today by a trigeminal sensory root avulsion [14] the prolonged and repeated use of injections in refractory cases which involve more than one division should be deplored

THE TREATMENT OF COMBINED DIABETES AND NEPHRITIS *

FREDERICK M ALLEN, M D
J WEST MITCHELL M D
AND
JAMES W SHERRILL, M D
NEW YORK

Several possible etiologic relationships may be thought of between such conditions as diabetes, arteriosclerosis and nephritis First and probably most important, there is the theory that all of these are due primarily to some infectious or toxic process, and the possibility that the same agency which damages one organ may also produce injury in one or more others With regard to secondary influences, it is scarcely conceivable that a pure nephritis could cause diabetes It is conceivable, however, that a primary arteriosclerosis might damage both the kidney and the pancreas It is barely imaginable that nephritis might cause hypertension, and this lead to arteriosclerosis, which in turn might affect the pancreas There has been in the past a strong suspicion that diabetes is a cause of arteriosclerosis, and in addition to the known frequency of association, especially in elderly persons with diabetes of many years' standing, evidence may be found in the high incidence of gangrene and the fact that this is almost invariably connected with advanced arteriosclerosis In severe diabetes there is sometimes a form of albuminuria which clears up under diabetic treatment, and albuminuria and showers of casts are well known accompaniments or precursors of diabetic coma Apart from such direct irritation, diabetes is a disturbance of nutritive function affecting all cells of the body, so that their power of resistance and repair is subnormal and they are more susceptible to all injuries Diabetes may thus predispose to renal and vascular disorders by increasing susceptibility to accidental injuries Positive proof of the foregoing interrelationships is lacking, and the evidence is chiefly statistical The following statistical observations have a bearing on this point

In 100 unselected diabetic cases in this institute the blood urea was found below 30 mg per hundred c c in sixty-seven, between 30 and 40 mg in seventeen, between 40 and 50 in ten, and above 50 in six These figures are mainly those obtained at admission on undetermined diets, but the series also represents more than a thousand analyses on these patients at different stages of treatment Renal function tests were performed especially when there was any suspicion of abnormality, and the McLean urea index was found below 80 in fourteen cases Four of these patients were clinically nephritics, two of them were in the fourth decade and two in the fifth decade of life, and one of each pair had hypertension In addition, there were twelve cases of hypertension with traces of albuminuria, and seventeen cases with palpably sclerosed peripheral vessels without albumin or hypertension All of these twenty-nine patients were elderly The sodium chlorid figures are scarcely capable of brief generalization here because of the uncertainty of normal standards, and will be given in detail elsewhere The impression may be stated that a large proportion of diabetics show noticeably high plasma chlorid concentrations and chlorid thresholds, which perhaps have some relation to the edema of some cases and the hypertension of others On the whole, it is doubtful whether diabetics show any higher proportion of clinical nephritis or impairment of nitrogen excretion than other hospital patients at corresponding ages, but some special tendency to retention of chlorids, vascular hypertension and arteriosclerosis may be suspected

There has also been opportunity for study of twenty-two supposedly nondiabetic cases of renal and vascular disease Six of these patients had marked nephritis, four of them with hypertension, the other sixteen were under treatment for hypertension alone The question arises as to the incidence of diabetes among such patients, especially as attention has been given in the literature to the occurrence and interpretation of hyperglycemia in hypertension cases Clinically, we must be governed by the usual criteria The carbohydrate-rich diet customary for these patients contributes to bring out any diabetic tendency, but an impermeable kidney may sometimes prevent glycosuria Transitory causes, special intoxications, etc, are known to affect the blood sugar in different ways but in general, when a patient can take carbohydrate-rich diet for long or indefinite periods with blood sugar within normal limits he is said to be free from diabetes, and when, on the other hand, high diets are accompanied by hyperglycemia which yields to restriction of carbohydrate and of total calories, such a condition is properly regarded as diabetes, even though it be mild and without glycosuria Two patients of this series were mildly diabetic in this sense, and in one of them the diagnosis was confirmed by marked hyperglycemia and slight glycosuria after ingestion of 100 gm of glucose The other patients of the series had normal blood sugars, and glucose tolerance tests which were performed in several of them gave normal results It is thus evident that hypertension in itself does not produce hyperglycemia Hyperglycemia found in such cases may be interpreted as evidence of diabetes the same as in other cases The proportion of pancreatic changes found at necropsies in cases of hypertension and arteriosclerosis fully accords with this conclusion

The treatment of combined diabetes and nephritis is conducted according to the usual principles for the two diseases A special difficulty is sometimes supposed to exist in the combined management, but recent methods have largely obviated the conflict Diabetic treatment by means of a high protein diet, gluten bread and the like may be inimical to an associated nephritis with impaired nitrogen excretion, but it is readily possible to adjust the protein ration to both diseases If meats are forbidden in the treatment of hypertension, the diet of a diabetic with hypertension is seriously limited, but with restriction of salt [1] such a patient is able to choose his protein at will One of the greatest dangers formerly consisted in acidosis in conjunction with nephritis, this is avoided under treatment which keeps acidosis strictly absent

To illustrate these principles, three cases of different types, each being the worst of its type in this series, have been selected for more detailed presenta-

* From the Physiatric Institute New York City and Morristown N J

* Read before the Section on Pharmacology and Therapeutics at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Allen F M Arterial Hypertension J A M A 74 632 (March 6) 1920

tion The first is a youthful patient with valvular disease, severe diabetes and nephritis, with marked tendency to hypertension and nitrogen retention, but without edema, decompensation or toxic symptoms

CASE 1—*History*—A man, aged 33, Irish-American, unmarried occupation clerical, was admitted Aug 17, 1919 His father was well at 72 His mother died at 36 of rheumatism followed by dropsy He has one brother and one sister in good health The family history was otherwise negative Th ough born at full term, he was a weak, undersized incubator baby, and always sickly He had pneumonia in infancy, and measles, mumps, scarlet fever, diphtheria, chickenpox and whooping cough before the age of 10 He never had tonsillitis or true rheumatism At 18 he had pain in the chest most of the year, and his physician diagnosed endocarditis The pain left after about a year, and he worked and enjoyed ordinary health, until at 25 years he had acute gangrenous appendicitis with uneventful recovery after operation Gonorrhea in 1913 cleared up under his physician s treatment without complications Syphilis was denied by name and symptoms The patient had had mild hay-fever for the last four years He had always had a huge appetite, very active bowels and apparently good digestion, but had remained thin nevertheless His life had been nervous and hard working but regular, with no excesses in sweets, alcohol or tobacco

Present Illness—In the summer of 1918 he caught cold on vacation and was surprised that he required a week to recover

arteries were palpably thickened There was a strong systolic murmur transmitted to the axilla and all over the precordia The blood pressure was 194 systolic and 142 diastolic The knee jerks were lively

Laboratory Tests—The urine was free from sugar and acetone, but contained heavy albumin and a few hyaline and granular casts which persisted throughout treatment The Wassermann reaction of the blood was negative The plasma sugar was 0 176 per cent before breakfast August 18 the plasma chlorids 648 mg per hundred c c the carbon dioxid capacity of the plasma 61 5 volume per cent the blood urea 134 mg per hundred c c The elimination of phenolsulphonephthalein was 5 per cent (1 5 per cent in the first hour, 3 5 per cent in the second) The urea index reckoned according to McLean was 4 7

Treatment and Progress—The patient was received as a bed patient because of his mitral regurgitation and hyperten sion Immediately after examination as there was no cardiac decompensation and it was desired to exclude rest as a factor in relieving the hypertension he was allowed to be up and about the ward freely with the consequence that his blood pressures registered 206 to 214 systolic and 160 to 170 diastolic with increased complaints of headache dizziness and weakness Treatment was begun with a salt-free protein-free diet of 50 gm of carbohydrate and 1 000 calories This diet consisted of starch and fat sometimes as puddings but generally baked into cookies with a variety of flavors to avoid monotony, and owing to the skill of the kitchen staff

He returned to work unrefreshed, and by mid-September developed thirst and polyuria His physician then diagnosed diabetes, and stopped the glycosuria by a twenty-four hour fast He remained at work on a diet till Feb 22 1919, taking an occasional fast-day when sugar returned A well known New York consultant called by his physician at this time found his condition dangerous on account of the combination of heart disease, diabetes, nephritis and hypertension and therefore kept him in bed for eleven weeks part of the time on milk diet The milk was tolerated at first but later other low protein diets had to be substituted to avoid glycosuria The systolic pressure after this treatment remained as high as 218 mm and he suffered a slight apoplectic stroke, causing partial paralysis of the left arm and right side of the face which gradually cleared up completely The diet meanwhile had been kept very low in protein (from 30 to 50 gm), but about a month before admission an increase to 75 gm had been made for the sake of strength His tolerance meanwhile was progressively falling so that instead of the 100 gm of carbohydrate which he could formerly take in his mixed diet without glycosuria he could take only 40 gm For three weeks before admission he was kept strictly in bed on a diet of 75 gm of protein, 40 gm of carbohydrate, and 1 250 calories

Physical Examination—The patient was 5 feet 8 inches in height and weighed 115 pounds He was thin and moderately weak, but still retained fair color and cheerfulness There was no edema and no irregularity or demonstrable enlargement of the heart, the rate was 96 per minute, the radial

the diet was as usual taken without difficulty The progress up to September 1 is shown in Table 1

The salt exclusion and fluid restriction up to August 25 produced a fall in blood pressure and relief of attendant symptoms, though the blood analyses were not bettered except by a slight fall in the concentration of chlorids The nitrogen excretion was low, also the low urinary chlorids failed to show any chlorid retention in this edema-free patient sufficient to account for his hypertension The large fluid intake beginning August 25 promptly produced dizziness weakness nervousness and general malaise The increase of urine was slow and inadequate, the rise of weight indicated retention of considerable water in the body without visible edema and there were also two or three loose bowel movements daily during this period The blood pressures recorded are representative of several taken at different times each day the diurnal variation was slight In contrast to the immediate symptoms mentioned the change in the blood pressure was slow August 28 the pulse pressure was surprisingly and somewhat alarmingly small thereafter the pressures rose The fall in the blood urea and chlorids may be ascribed partly to the transitory flushing out (less evident in the nitrogen than in the chlorids of the urine) but probably mostly to dilution though it should be noticed that such dilution did not greatly alter the plasma sugar or bicarbonate A fast-day August 31 improv[illegible]ble [illegible] partic[illegible]larly the unduly high sugar

September 1 to 9 the [illegible] of the food) was res[illegible]

increased so as to make the diet 50 gm carbohydrate and 1,500 calories Subjective symptoms were promptly relieved and the blood pressure fell slowly to 148 systolic and 115 diastolic The increase of the protein-free diet was intended to reduce protein catabolism to a minimum, and the urinary nitrogen actually fell by September 9 to the unusually low level of 1 3 gm Nevertheless, with the diminished fluids, the blood urea had risen on the same date to 63 8 mg per hundred c c, while the plasma sugar was 0 181 per cent and the chlorids 560 mg per hundred c c

After September 9, the diet was changed to 30 gm of protein, 30 gm of carbohydrate and 1,200 calories with one fast-day weekly On this program the plasma sugar gradually fell to 0 123 per cent, September 27, and 0 105 per cent, October 13, and remained normal thereafter The systolic blood pressure remained almost constantly below 160 mm though the patient was up and dressed all day and spent half of every day in light tasks in the hospital or errands outside On a few occasions of exceptional strain the systolic pressure went up for a few hours between 170 and 190 Several tests were performed with ingestion of salt as high as 10 gm daily and water as high as 5 liters, but restoration of the hypertension by this means was impossible The reason may be found perhaps in the improvement of the diabetes or perhaps in the ready tendency to diarrhea The phenolsulphonephthalein elimination was improved at the lower pressures ranging in several tests from 21 to 27 per cent in two hours On one or two days each week the fluid restrictions were relaxed and 30 gm of magnesium sulphate given for eliminative purposes With 2 gm of sodium chlorid in the diet, the final blood analysis November 24, revealed plasma sugar 0 123 per cent, plasma chlorids, 531 mg per hundred c c, and blood urea, 31 3 mg per hundred c c The chief unfavorable feature was that the diastolic pressure was never reduced below 108 and was more often about 115 mm The patient was dismissed November 24 on a diet of 30 gm of protein 40 gm of carbohydrate 2 gm of salt and 1 300 calories, at a weight of 78 pounds

At home, various unintentional mistakes occurred with the diet On visits to the hospital blood samples were taken during digestion of breakfast The worst results were plasma sugar 0 25 per cent, plasma chlorids 623, and blood urea, 112 mg per hundred c c and blood pressure 180 systolic and 130 diastolic With further experience the results have remained equal to those in the hospital It has become possible to change the fast-days to days of half or quarter diet The patient has resumed his former very light clerical occupation but can work only half time with great effort He remains entirely well subjectively except for the existing degree of emaciation hunger and weakness

Although in the majority of combined cases the diabetes or the nephritis or both are mild, this case shows that they are sometimes severe There is no serious conflict in the treatment even here The diabetes does not interfere with protein restriction for the nephritis, or salt restriction for the hypertension There is an actual problem in providing the necessary calories This is solved by undernourishing the patient to the point at which he can tolerate 30 gm of carbohydrate Incidentally, the unusually low protein ration raises the tolerance for carbohydrate With this carbohydrate it is possible to fill up the rest of the diet with fat without acidosis The relief of the hypertension relieves the heart, and the patient is capable of more exercise and work than before At the same time the weakness of diabetes and undernutrition seems not to impair the heart but is the greatest safeguard against overtaxing it, and probably without the diabetes the heart trouble would have become worse The diet is a hard one, because of the close restriction of carbohydrate, protein, total calories and salt Otherwise the patient is as comfortable as though he had diabetes alone His actual prognosis also is that of the diabetes or whichever single condition proves most dangerous, without special influence of the complications

The second patient is a woman past middle life, with moderate diabetes and nephritis, with dangerous hypertension and retinitis, but slight tendency to nitrogen retention, edema or intoxication

Case 2—This patient was No 16 in the Rockefeller Institute series and her history up to the summer of 1917 has been given elsewhere In two admissions to the Rockefeller Institute Hospital she had been observed by the diabetes and nephritis services and had been dismissed symptom-free and with a good prognosis from the standpoint of diabetes and unrelieved and with a bad prognosis from the standpoint of nephritis The last blood pressure recorded in the publication mentioned was 250 systolic 160 diastolic Subsequently the patient was somewhat careless in diet and received treatment elsewhere, in the form of dietary restriction for glycosuria and two days of bed rest each week for the hypertension The hypertension continued and there were increasing symptoms of headache weakness, dizziness and mental confusion Finally, dimness of vision due to an actively progressing retinitis forced her to apply for resumption of treatment and she was admitted to the hospital, Sept 4 1919

This admission was five years after her first diabetic treatment at the Rockefeller Institute The age was now 52 years The weight was 138 pounds about the same as at the former discharge The physical examination was essentially as before except that arteriosclerosis seemed more marked in both the radial and the retinal vessels, and the heart slightly more enlarged Its rhythm was regular the sounds very loud with a systolic murmur at the apex as before There was slight edema about equal in the face and limbs The blood pressure was 220 systolic 140 diastolic

The laboratory examination revealed moderate sugar and nitroprussid reactions in the urine slight albumin, a few hyaline casts and no blood cells In contrast to the former strong Wassermann reactions this test was now entirely negative in repeated examinations in the laboratory of Dr Cyrus Field perhaps in consequence of previous antisyphilitic treatment The plasma sugar was 0 349 per cent, plasma chlorids, 580 mg per hundred c c, blood urea 43 6 mg per hundred c c The carbon dioxid capacity was at first slightly low (53.2 per cent by volume) but rose quickly to 61 7 and remained normal thereafter A single determination of the blood creatinin by Dr Field revealed 4.2 mg per hundred c c

This treatment differed from the previous treatment at the Rockefeller Institute only in the fact that the fasting was absolute and salt was omitted from the subsequent diet. The blood pressure which was known to have been greatly elevated for more than five years, was thus reduced very quickly and easily The retinitis was also halted completely, whether

2 Monograph 11 Rockefeller Institute 1919

by relief of the diabetes or the nephritis is undetermined The patient was discharged October 23 at a weight of 125 pounds, on a diet of 50 gm of protein 30 gm of carbohydrate and 1,500 calories, with 2 gm of sodium chlorid She had received 30 gm of magnesium sulphate twice a week in the hospital with apparent benefit, and was instructed to continue this purgation at home No rigidly normal level of blood sugar was demanded because of the patient's age and her known tendency to break diet

At subsequent visits she admitted minor indiscretions in both food and salt, but has held to the diet better than usual because of fears for her eyes The worst analyses, during digestion forenoons or afternoons have been plasma sugar, 0 25 per cent , plasma chlorids 619 mg per hundred c c , blood urea, 39 6 mg per hundred c c The best have been

sion which is resistant to these measures and to rest treatment sometimes yields readily to salt privation

The third patient represents mild diabetes under successful control on which was superimposed a hopelessly severe nephritis, with slight hypertension and edema, but marked nitrogen retention and intoxication

CASE 3—*History*.—A man aged 46 American unmarried physicist was admitted Nov 19 1919 The father died at 70 with diabetes the mother at 68 of liver disease, a paternal aunt at 70 of diabetes One sister of the patient died in childhood another died following a cesarean section sugar being found in the urine after this operation The entire family were obese The patient had had as the only

plasma sugar, 0 175 per cent chlorids, 605 mg per hundred c c blood urea 22 6 mg per hundred c c The highest blood pressure found at the time of the highest plasma chlorid was 186 systolic and 90 diastolic The lowest pressure found at the time of the lowest plasma chlorid was 152 systolic and 80 diastolic The symptoms previously associated with the hypertension now remain absent

This patient will always be as lax in diet as she dares, and the results will therefore never be ideal Treatment of diabetes and reduction of obesity sometimes suffice by themselves to reduce blood pressure, as illustrated by one striking case (No 33) in the Rockefeller Institute series This observation supports the foregoing statistical view that active diabetes creates some tendency to hypertension The present patient illustrates the fact that a hyperten-

known illness attack [illegible] unknown [illegible] time he had [illegible] rapidly so that [illegible] 37 [illegible] old [illegible] obtained in 192[illegible] had been good [illegible]

I present this [illegible] the [illegible] A [illegible] 9 [illegible] J [illegible] seven years [illegible] and ignored [illegible] or [illegible] weeks [illegible]

which result in somewhat similar curves For instance, constitutional disturbances and severe anemias can give rise to the same sort of low acid curve that the entire gastritis group can give, but the former is accompanied by simply a depression in secretion, and the latter not only by secretory depression but also by the tangible evidence of mucosal inflammation Again, there is unquestionably a form purely nervous, and finally there is a form in which the elaboration of secretion by the mucosa is intact, but in which the low acid curve is due to excessive regurgitation of alkaline duodenal secretions In other words, it is evident that widely different mechanisms can bring about similar conditions in the secretory output of the stomach

BASIC FACTS

We propose, therefore, in this paper to review briefly the subject of gastric analysis as we see it, based on the contributions from our laboratories, and attempt to outline a crude but sufficiently satisfactory system for the interpretation of gastric analysis Before we discuss the question of the analysis of pathologic curves, we would call attention to the following important facts which form a basis for the consideration of pathologic data In other words, we must have a normal standard, and a normal standard demands not only the average responses but also the limitations encountered in health

1 Gastric digestion is a series of recurring cycles in which digestive phases alternate with interdigestive phases (fasting or resting stomach) Both of these phases must be investigated in an analysis of gastric function

2 The normal fasting stomach shows a continued secretion, averaging from our studies about 50 c c, with an average total acidity of 30 and a free acidity of 18 We would place as the outside limit of total acidity 70 and the outside limit of the free acidity as 50, although these figures, or rather limitations, may have to be altered There should be no gross food retention, no pus or blood, and only traces of gastric mucus Bile is present in more than 50 per cent of cases and trypsin in practically all, indicating a tendency toward regurgitation during this period

3 The digestive phase in health varies with the type of the individual, whether hypersecretory, isosecretory or hyposecretory, all of them being adequately described in contributions on this subject, and also according to the nature of the meal In normal individuals 74 per cent of the beef experiments showed an acidity of 100 or more, while only 22 per cent of the egg cases, 44 per cent of the responses on milk and cream, 19 5 per cent of the vegetables, and 7 3 per cent of the bread and cereals gave an acidity of 100 or over If, therefore, the average acidity of beef was 120 and vegetables only 70, it is safe to assume that a series of figures which represented the test meal responses for beef must be very different from those obtained on eggs, those on milk, and finally those obtained with toast and tea

4 The gastric curve is clearly made up of psychic and chemical secretions, both definable by separate laboratory procedures Today we can accurately measure the psychic secretion, the chemical secretion, the continued secretion in the fasting stomach, and the amount of duodenal regurgitation

5 Hypersecretion is a phenomenon seen in about 40 per cent of normal individuals

EXAMINATION OF THE STOMACH

Therefore, it follows that with the foregoing facts clearly established, we are ready to examine the stomach from several different angles

1 A test meal to demonstrate the maximum acid output is obviously most readily administered in the form of 100 gm of beef which in health shows an average total acidity of 120 and an average evacuation time of two hours and thirty-five minutes in the rapid emptying type, and three hours and twenty-five minutes in the slow emptying type

2 Motor function may be demonstrated as above, or far more satisfactorily by means of the simple Ewald meal, with limitations given below

3 To demonstrate pathologic products from the gastric wall, the water meal used in our early work and later proposed by Austin is a gastric stimulant and has the advantage of showing any abnormality in gastric output

4 The psychic secretion is obtained for sight, taste and chewing of food by introducing the fractional tube and performing these several steps preferably with 100 gm of chopped meat, allowing the subject with the tube in situ to see, smell and taste the cooking beef

5 A pure chemical curve may be obtained by injecting the meal through the tube

6 Test meals to reveal specific factors, such as soluble albumin are those in which this substance is reduced to a minimum, as in the Ewald meal

ANALYSIS OF GASTRIC FUNCTION

For the purposes of ordinary analysis, however, we clearly want to get information from two separate standpoints one as to gastric function, the other as to the specific evidence of gastric disease, namely, the demonstration of histologic, chemical or bacteriologic evidence of disease For the purpose of functional analysis—which is not specific analysis and must not under any consideration be construed as such—we require a fixed standard and an exact knowledge of normal function We shall never be able to correlate gastric findings with a diversity of test meals While meats, fish and milk give the highest acid values, breads, cereals, fruits and then vegetables give the lowest normal values Only six cases out of eighty-two experiments on bread and cereals[2] gave an acidity of 100 or over, indicating that the average output for bread is comparatively low, but emphasizing nevertheless that high acid figures occur in health, and that high acid figures are less important from a pathologic standpoint than low acid figures But one thing is clear High acidity is of far more significance with bread and cereals from a pathologic standpoint than it is with meats and animal proteins

The simple Ewald meal of 35 gm of toast and 240 gm of water or tea appears to us as the simplest meal, and the double advantage of inducing a moderate acidity with rapid evacuation time We can, therefore, accurately delimit the evacuation time or the measure of motor function An Ewald meal in health is evacuated in from two to two and one-half hours Anything at one hour and one-half or less, or more than three hours, can be considered outside the normal boundary lines In health we encounter slow and rapid stomachs, but only rarely we encounter figures in excess or below these limitations We would,

2 Smith Fowler Bergeim Rehfuss and Hawk Unpublished data

therefore, from a motor standpoint divide all pathologic responses into two groups (barring a third pathologic group giving normal evacuation time) one with too rapid evacuation time or hypermotility, and the other with too slow evacuation time or hypomotility From a study of the clinical cases of one of us, we have found that hypermotility can be ascribed to four causes (1) a group of subacidity and achylia cases, (2) a very small percentage of duodenal ulcers, (3) a form of scirrhous carcinoma converting the pylorus and antrum into a funnel, and (4) a group due simply to peristaltic overaction, including those very motile stomachs which the French have called "gastric chorea"

From the standpoint of delayed evacuation or hypomotility, we have both intragastric and extragastric causes, the slight delays being found most frequently with gastric myasthenias, atonic stomachs, and muscle defects beginning dilatation, while the marked delays are due to intragastric causes, such as contracting pyloric ulcer, carcinoma of the pylorus, hypertrophic pylorus, benign tumors in that region, pylorospasm, gastric syphilis of the stenosing type, contracting ulcer of the lesser curvature with organic biloculation, and as extragastric causes adhesions to the pylorus and duodenum, tumors interfering with gastric evacuation, such as tumors of the head of the pancreas

SECRETORY VARIATIONS

From a secretory standpoint, with this meal we have every variation, from exaggerated secretion or hyperacidity and hypersecretion to subacidity, anacidity, achylia and delayed gastric acidity In practically every case, the variations in the secretory output can be placed in four categories (1) nervous, (2) circulatory, (3) mucosal, and (4) a disturbance of the tryptic regurgitant mechanism

We prefer, therefore, in the analysis of the secretory curve to divide all gastric secretory curves into four groups, depending on whether or not they are associated with definite evidence of diseased gastric states For purposes of analysis, one might divide all gastric responses in disease into four groups (1) clean digestion, simple secretory variations, (2) secretory variations plus gastric mucus, indicating inflammation of the mucous membrane, (3) secretory variations plus blood (intragastric), indicating ulceration of the mucous membrane, and (4) secretory variations plus blood, pus, mucus and bacteria, indicating ulceration and infection of the mucous membrane

Group 1 A clean digestion (and by that term we mean no evidence of mucosal irritation or disease), whether there be functional alterations or not, indicates in the presence of gastric symptoms that conditions outside the stomach are responsible for the gastric response, and that the latter is usually a secondary manifestation For instance, a larval hyperacidity may be encountered in psychic disturbances, or a digestive or postdigestive hyperacidity or hypo-acidity may be encountered, in which case the ultimate analysis will usually reveal factors outside the stomach inducing secretory changes It is this clean group which is so frequently encountered in certain biliary disturbances, appendical disease, abdominal adhesions, etc The assumption is that most frequently the effect is produced over nervous pathways and less frequently through the circulation Clean subacidities and achylias are encountered in metabolic conditions, such as gout, thyroid disease, pellagra and almost any toxic condition which inhibits the vagus or stimulates the sympathetic, or through the circulation produces direct inhibition of the gastric mucosa This is particularly true of those types associated with focal infections and anemias

Group 2 A secretory variation with the addition of a pathologic element immediately introduces the element of a gastric pathologic condition The commonest pathologic element is gastric mucus which must be differentiated from swallowed mucus The definite and persistent presence of this element immediately introduces us to a very large group—the gastritis group There are many varieties in fact, some time ago one of us was able to collect more than 200 causes of chronic gastritis induced in a variety of ways—direct irritants representing the whole line of dietary indiscretions and food infections, the great group associated with irritants carried by the blood stream, and a third group in which the chronic inflammation was secondary to diseased conditions occurring in most of the body viscera By widely different mechanisms, these factors are able to produce similar lesions

Group 3 In this group there is the addition of blood to secretory variations (meaning intragastric and not swallowed blood) Blood in the stomach means ulceration whether it be minute hemorrhagic erosions, acute ulceration multiple erosions or chronic round ulcer, or whether it means ulceration or a neoplasm, such as carcinoma or gumma While it is true that a certain proportion of gastric ulcers do not bleed, nevertheless the continued presence of this fluid immediately indicates the element of ulceration We have seen stomachs at operation which revealed blood and no visible spot of ulceration, nevertheless there was intense congestion In our series of ulcers, only 38 per cent showed high acidities, and 30 per cent, comparatively low acidity With ulcer of the duodenum an almost pathognomonic finding is blood with tryptic regurgitation or bile, and only at those periods

Group 4 This is the group in which there is unquestioned evidence of infection and inflammation of the mucosa In other words, the presence of blood, pus, mucus and bacteria indicates ulceration, inflammation and infection of the stomach, and we have found this syndrome in only three conditions true infected gastritis, gastric carcinoma, and gastric syphilis With the exception of rare forms of acute and phlegmonous gastritis, the presence of one of these three can be surmised if it can be demonstrated that these factors are intragastric and not extragastric or swallowed The latter is discrete and does not persist throughout the curve while the gastric material will be found throughout digestion and particularly toward the end of digestion

The fact that alterations of the gastric secretion with persistent mucus content indicate gastritis by no means ends the investigation As we have pointed out an investigation must be made as to the correlated causes likely to induce such a disturbance The analysis of the subacidity acidity achylia and delayed digestion curves demand, therefore, a careful study of all the associated factors

INTERPRETATION OF GA[illegible]RES

Our idea is simply to pro[illegible]
the study of gast[illegible]

functional data, such as the type of secretory curve and the evacuation time, does not make a diagnosis, but it constitutes evidence which, when correlated with other factors above mentioned and the general summary of the case, is of the greatest importance Every gastric curve is a sum total of a series of factors which must be critically analyzed It is a mistake to put the cart before the horse and say that because so many cases of gastric ulcer reveal hyperacidity, a hyperacid curve is indicative of ulcer Gastric ulcer can and does occur with a normal secretory and motor mechanism, and, so far as we can demonstrate, no functional variation, a point which is simply another link in the chain of evidence to indicate that certainly some forms of ulcer have neither secretory nor motor variations as etiologic factors, but some other cause, probably toxic, to explain their presence Gastric cancer in its inception must exist with little or no demonstrable change in function Gastritis induces changes in function, and as such they are readily demonstrable, and the whole line of muscular disturbances induces changes in evacuation which are readily demonstrable Let us realize here and now with gastric analysis as with the roentgen ray that neither lies but that it is our interpretation which is faulty We found out long ago that we could not make our analytic findings fit our preconceived notions of what the case ought to show The attempt to trace the gastric responses in many of the diseased conditions is laudable, but more laudable is the attempt to analyze in a given case the factors that have brought about such a change

CONCLUSIONS

In the present state of our knowledge the following assertions seem justifiable

1 Gastric analysis is either functional or specific, and in both fields it has its limitations The fractional analysis of a test meal is an exact determination of secretory and motor function, and the results of these two studies can demonstrate only alterations in function Functional alterations may be functional or organic in origin To the analysis of motor and secretory function should be added the demonstration of specific pathologic elements, such as blood, pus, mucus and bacteria Only the evidence of cancer cells or the persistent presence of pathogenic infecting organisms can be considered pathognomonic

2 The interpretation of gastric analysis presupposes a knowledge of the normal gastric output This is now well defined for both the periods of gastric activity and rest These normal variations are given above The secretory normal response can be divided into three types, but in disease any variation can occur Disease may alter either the digestive or interdigestive curve or both, it may alter function and it may add its specific elements to the sum total of gastric work

3 There is no pathognomonic curve in any gastric condition There is no pathognomonic curve in gastric cancer, ulcer, the inflammations or, for that matter, any of the gastric conditions We can only say that it may, and usually does, produce definite types of secretory and motor alterations and definite forms of pathologic elements

4 A sane view of this subject is urgently necessary, and, most of all, is needed constructive work on the factors which induce alterations in function, as well as the isolation and demonstration of those pathologic elements which indicate a true gastric pathologic condition Nowhere else is this so essential as in the study of gastric carcinoma

5 We must have clearly defined the variations in health factors which we have attempted in our laboratories and already indicated on studies in beef, pork, lamb, milk, eggs, vegetables, and in articles shortly to appear on the effect of the entire line of foodstuffs on normal gastric digestion

This paper is presented in the hope that it will suggest a basis for the logical interpretation of gastric findings

THE COAGULATION TIME OF BLOOD IN THE NEW-BORN

WITH ESPECIAL REFERENCE TO CEREBRAL HEMORRHAGE *

F C RODDA, M D
Assistant Professor of Pediatrics University of Minnesota Medical School
MINNEAPOLIS

Interest in this subject was awakened by necropsy findings on infants from the New Born Clinic, University of Minnesota Statistics from our clinic show that postmortem examinations reveal cerebral hemorrhage in more than 50 per cent of all infants that die intra partum or during the first few days of life It was notable that these findings often were made following nonmstrumental or even easy deliveries They were especially frequent following breech presentations and in premature births Case 2, twins, was an illustration of this The first, delivered by forceps, showed no cranial complications, the second, smaller and easily delivered by version and extraction, died of cerebral hemorrhage (Case 2) The factor of asphyxia neonatorum to which Little,[1] Cushing[2] and others ascribe the cerebral damage was not always present It was further noted that at necropsy the blood was often found only slightly coagulated or even fluid

Historically, there are three landmarks which indicate the progress in our knowledge of cerebral hemorrhage in the infant Little, in 1861, was the first to call attention to the relationship of what he termed asphyxia neonatorum following difficult or instrumental deliveries to mental and physical defects that developed later—mental deficiencies and spastic states The classical studies of Sarah McNutt[3] in 1885 showed that cerebral hemorrhage was the specific cause of these lamentable conditions Cushing's bold pioneer work in 1905 demonstrated that craniotomy with removal of the clot was a feasible procedure and a preventive of subsequent cerebral degeneration with its sad and irremediable train of symptoms

The great frequency of cerebral hemorrhage has not been fully realized, and the etiology still remains obscure Old theories of asphyxia and injury from forceps might explain the occurrence only in part Dealing with this interesting problem, one finds a very

considerable literature during the last two decades Warwick[4] gives a comprehensive summary, and emphasizes the great frequency of this lesion in the new-born Weyhe[5] gave his percentage of cerebral hemorrhage in 950 necropsies on the new-born as 12, Beneke,[6] on 100, as 14, Archibald,[7] on 73, as 43, Warwick, on 36, as 50, and Parrot,[8] on 34, as 76 We believe that complete routine necropsies will prove that the figures of the last two writers are not exaggerated Cerebral hemorrhages are found when least expected A case of congenital heart lesion with transposition of the viscera (Case 6) gave no symptoms of hemorrhage except prolonged coagulation and bleeding times, but necropsy demonstrated a large hemorrhage over the cerebrum The figures quoted show unquestionably that by far the most frequent cause of death in the new-born is cerebral hemorrhage If Little and McNutt were correct in the assumption that intracranial hemorrhage is the most frequent cause of spastic birth palsies, the thousands of these patients drifting about in search of relief add further proof of the frequency of cerebral hemorrhage

The more rational and in part demonstrated theories as to etiology may be briefly stated Beneke believes that the hemorrhage is due to the stretching and tearing of the tentorium resulting from elongation of the skull Cushing ascribes as one cause the rupture of veins over the vertex from overriding of the cranial bones In a second, he concurs with Little and Abels[9] that rupture of veins occurs as a result of congestion and backing up of blood in the cerebral vessels Seitz,[10] in an exhaustive study, gives three causes (1) rupture of the longitudinal sinus or veins emptying into it with blood collecting over the cerebrum, (2) rupture of the transverse sinus or tearing of the tentorium and release of blood over the cerebellum, and (3) rupture of vessels of the choroid plexus with accumulation of blood in the ventricles

Henschen[11] believes that by far the most frequent site of intracranial hemorrhage is over the cerebrum, over the parietal area and often limited to one side Seitz and Cushing give as the reason for this the anatomic relations There are from ten to twelve veins (from four to six of goodly size) extending from the subarachnoid space to the superior longitudinal sinus, which they enter at right angles under cover of the parietal bones In the adult at the points of entrance occur the pacchionian bodies which afford support to these veins These bodies are absent in the new-born, so that minimal trauma is capable of destroying continuity of these vessels Compression and distortion of the skull by instruments, or even the molding of a normal labor, might readily rupture these vessels Further, the frail vessels and compressible head of the premature infant might account for the rather striking frequency of cerebral hemorrhage in the premature infant

Massive hemorrhages in the stillborn or in infants that die in the first hours of life probably result from the rupture of large veins sinuses or tears of the tentorium Seitz's studies on frozen sections of the skull would seem to support this deduction

There remains, however the majority of the cases of cerebral hemorrhage developing insidiously and not until several days after birth causing symptoms of increasing intracranial pressure convulsions and death In these cases, necropsy reveals a large clot with a thick center, thin edges usually unilateral and covering the parietal area There is no demonstrable source of hemorrhage—no torn veins or rents in the sinuses But further examination will show multiple hemorrhages throughout the body in locations where it is hard to conceive of trauma from normal birth forces or obstetric procedures

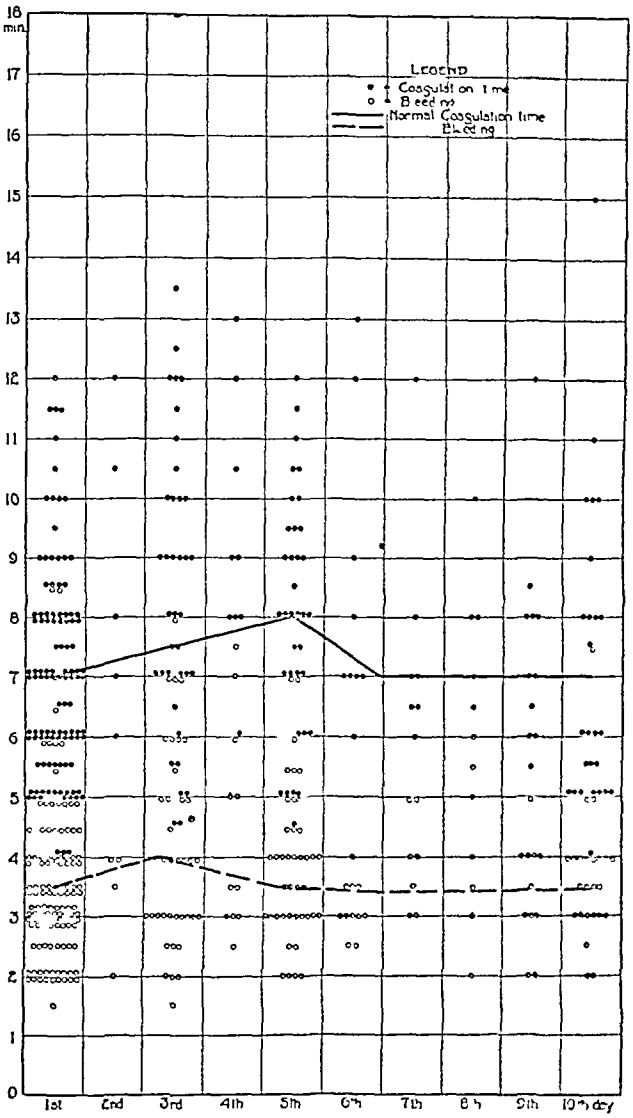

Chart 1.—Determinations of coagulation and bleeding time on various days of first ten

ILLUSTRATIVE CASES

CASE 1 (No 14915).—*History.*—A girl born to a primipara was born by easy breech delivery During life there was no evidence of sepsis The temperature curve was normal Cyanosis shallow irregular breathing bulging fontanel protracted crying contracted pupils blood, spinal fluid prolonged bleeding, from [illegible] cure,

emesis of blood, a rapidly growing cephalohematoma, and a large subcutaneous hemorrhage over the lumbar region were followed by death on the sixth day

Necropsy Findings—Blood ran from the nose There were subcutaneous hemorrhages over the chest, arms, back and occipital region Blood was present in the abdominal muscles and under the peritoneum, free blood was found in the pericardial cavity, under the pericardium and in the bronchial tubes There was profuse hemorrhage into the lung tissue, and there were massive hemorrhages over the temporal and occipital lobes No source of bleeding was found

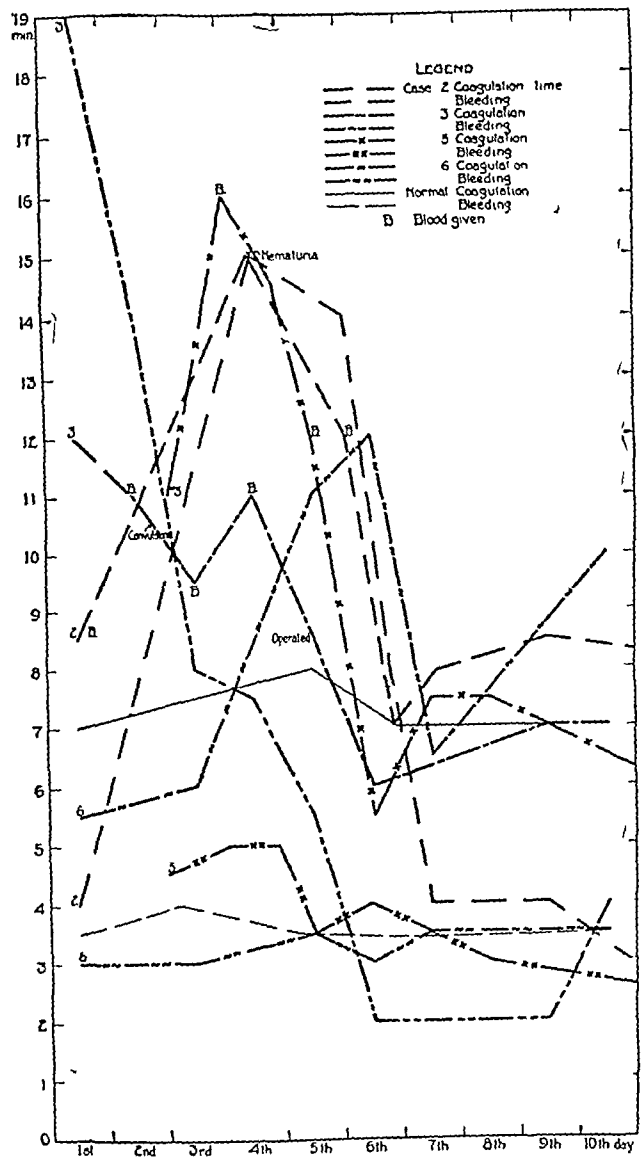

Chart 2—Coagulation time in a series of cases above the normal range

CASE 2 (No 16178)—*History*—L, girl, the second twin, the first delivered with forceps without evidence of trauma, this one delivered by version and later presenting unequal inactive pupils, bulging fontanel and spasticity of limbs, died on the fifth day

Necropsy Findings—A very large hemorrhage into pericardial sac and about the vessels of the neck was found Hematoma of the scalp hemorrhage into the lungs and a massive hemorrhage over the right cerebrum were noted

CASE 3 (No 8463)—*History*—R, boy, born after normal labor showed signs and symptoms of cerebral hemorrhage and died on the third day

Necropsy Findings—There was hemorrhage into the heart, lungs and skin as well as a subdural hemorrhage

CASE 4 (No 14597)—*History*—P, girl a premature infant born after a very easy labor, with no sign of syphilis, died on the second day

Necropsy Findings—There was extensive hemorrhage into the lungs and brain

More than 25 per cent of all our cases posted show this picture of multiple hemorrhages Careful analyses of cases reported in the literature by Cushing, Green and others will permit one to duplicate these findings many times

From these findings, it was concluded that there were factors other than instrumentation and trauma concerned in cerebral hemorrhage, and that perhaps the obstetrician was carrying some burdens unjustly laid upon him Concomitant symptoms of hemorrhagic disease during life, with the demonstration of multiple hemorrhages at necropsy, suggested further studies on the etiology, and especially on the question of disturbances of the coagulation properties of the blood in the new-born Credit must be given to Green,[12] who, in 1914, first suggested this factor I therefore undertook studies on the coagulation time of the blood in patients giving evidence of cerebral hemorrhage

GENERAL OBSERVATIONS

An account of the method used and the results obtained has already been published[13] Certain general observations which were made may be helpful in the present study (Charts 1 and 2)

1 The average coagulation time in the normal newborn, with my method, is seven minutes, with a normal range of from five to nine minutes, the average bleeding time, with Duke's method, is three and one half minutes, with a normal range of from two to five minutes

2 There is a prolongation of coagulation and bleeding times from the first to the maximum on the fifth day of life, with a return to the average first day determination time before the tenth day It is significant that this coincides with the age incidence of hemorrhagic disease and cerebral hemorrhage

3 Evidence of hemorrhages appeared when a prolonged bleeding time accompanied a delayed coagulation time

4 Delayed times were favorably affected by the subcutaneous administration of whole blood

For their relationship to the problem in hand the results obtained in certain conditions of the new-born may be cited

1 In icterus neonatorum normal coagulation and bleeding times were found

2 No cases of sepsis neonatorum were presented for study

3 Several cases of melena neonatorum gave markedly prolonged coagulation times—up to ninety minutes—and bleeding times of hours, days or until the condition was controlled Schloss and Commiskey,[14] in their studies, obtained similar results in some of their cases Symptoms were relieved, and the reactions returned to normal with repeated injections of blood

4 Suspected and mild cases of congenital syphilis gave normal findings Severe and progressive cases

gave prolonged times Further, though a temporary reduction in the times could be obtained by the administration of blood, it was not permanent, and one patient died of hemorrhage in spite of repeated injections of blood subcutaneously and into the superior longitudinal sinus This result was quite contrary to that obtained in melena, and may be explained by the presence of some destructive agent rather than a condition of deficiency of certain substances concerned in coagulation

RESULTS IN CEREBRAL HEMORRHAGE

The results in cases of cerebral hemorrhage, which is under consideration, were rather striking (Charts 3 and 4)

CASE 5 (No 16178, Chart 3) —*History*—L, girl, a twin, born March 11, 1919 with breech delivery, was in rather poor condition at birth mouth to mouth breathing was employed March 12, the child's condition was good March 13, pallor weak pulse and unequal pupils which failed to react to light, were noted The head was pulled to the left, the limbs were spastic, the spinal fluid was blood tinged There was hematoma of the scalp The coagulation time was thirty-nine minutes The infant was given 25 c c of the mother's blood March 14 the findings were as before, with paresis of the right side of the face, the spinal fluid was bloody After standing the supernatant fluid was yellow (Xanthochromia of the spinal fluid we find to be a rather constant finding if blood is present about the base of the brain or in the upper spinal canal) The coagulation time was ninety minutes The infant was given 25 c c of the mother's blood, this was repeated March 15 Icterus and Cheyne-Stokes breathing were present The spinal fluid findings were the same as on March 14 Twenty-five c c of blood was given The coagulation time was eleven minutes The child died at 10 45 p m

Necropsy Findings—There were large hemorrhages into the pericardial sac in the lung, and over the entire right hemisphere, there were small hemorrhages over the tentorium and in the spinal canal Blood injections appeared to have controlled the coagulation time, but the child died from intracranial pressure

The twin brother had an emesis of blood on the third day The coagulation time was found to be fifteen minutes It was given 25 c c of the mother's blood The subsequent course was normal

CASE 4 (No 18583 Chart 3) —*History*—H, boy, whose mother was a primipara was born March 13 1920, with a low forceps delivery A slow fetal heart rate had been noted The child's color was good at birth, but he became cyanosed after ligation of the cord March 14 the child gave a lusty normal cry There was extreme cyanosis and no heart murmur The coagulation time was eleven minutes, the bleeding time was four minutes March 16, physical examination revealed the apex beat in the fourth intercostal space on the right nipple line The liver was palpated on the left side, the spleen on the right A diagnosis of transposition of the viscera was made The patient's condition was good except for cyanosis March 17, respiratory embarrassment was extreme, the pulse rate was 40 coagulation time, thirteen minutes bleeding time indefinite. Bleeding from the site of the puncture continued for hours No blood was given, and the patient died

Necropsy Findings—Complete transposition of the viscera rudimentary right heart with lack of the intraventricular septum and a large blood clot over the parietal region were found During life there were no specific signs or symptoms of cerebral hemorrhage except the blood changes The slow pulse, noted before birth, and the cyanosis were attributed to the cardiac condition

CASE 7 (No 17419 Chart 3) —*History*—L M girl whose mother was a primipara was born, Oct 1 1919, with normal delivery She weighed 2400 gm October 2 the findings were normal the coagulation time was seven minutes the bleeding time four minutes October 3 and 4 there was normal progress October 5 the patient was cyanosed and Cheyne-Stokes breathing was present Hematoma over the right parietal region was noted for the first time The coagulation time was eleven minutes the bleeding time eight minutes The infant was given 15 c c. of blood subcutaneously and died a few hours later

Necropsy Findings—Hemorrhages into the tissues of the scalp with hematoma over the right parietal area were found also extensive subarachnoidal bleeding over both temporal areas with a small amount of blood over the cerebellum and in the ventricles This case presents a very late onset of symptoms apparently a slow hemorrhage

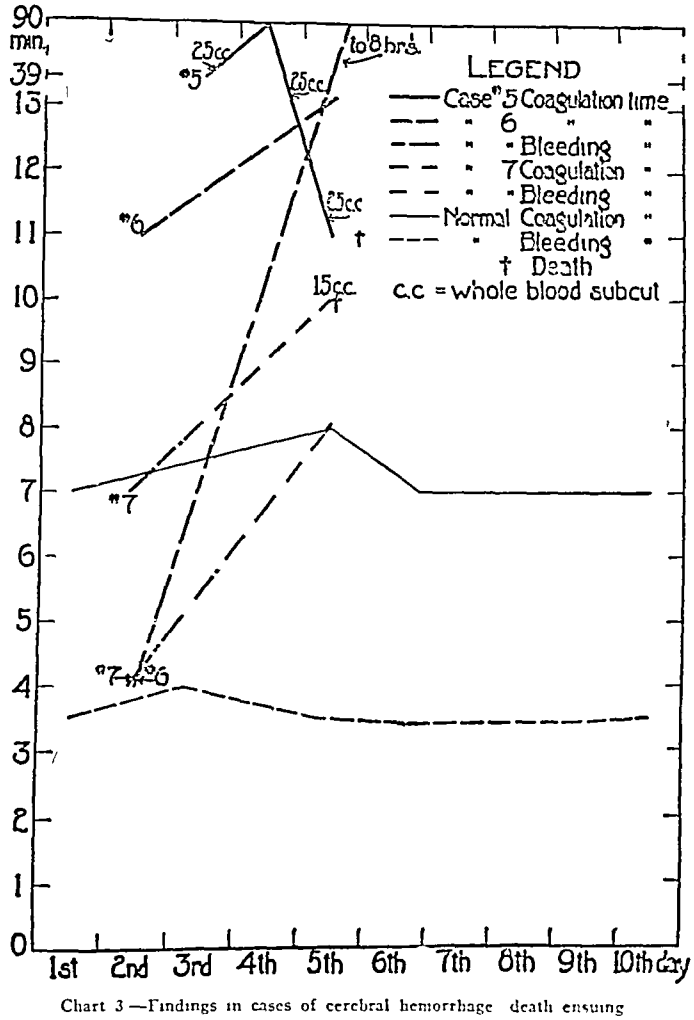

Chart 3 —Findings in cases of cerebral hemorrhage death ensuing

CASE 8 (No 16634 Chart 4) —*History*—S boy was born May 26 1919 with normal delivery after long labor May 27 a large cephalohematoma rapidly increasing in size was noted as well as petechial hemorrhages over the arms chest and abdomen There was spasticity of the right hand Twelve hours after birth the patient was given 30 c c of blood subcutaneously Seven hours later 20 c c. more blood was given The coagulation time was then four minutes the bleeding time eleven minutes May 28 the coagulation time was four minutes the bleeding time four and one half minutes The patient had convulsions The spinal fluid was bloody the coagulation time was four minutes the bleeding time seven minutes May 29 the findings were the same the coagulation time was seven minutes the bleeding time ten minutes The patient was given 22 c c of blood May 30 operations performed by Dr A C Strachauer A la

was turned down and a blood clot removed There was slight oozing from the wound The patient was given 25 c c of blood May 31, the condition was as before operation except for lack of convulsions June 1, spasticity was clearing, the coagulation time was five and one-half minutes, and the bleeding time, six minutes June 6, there was continuous improvement The blood reaction times were normal

Present Condition—The patient was seen at 10 months, he appeared to me a normal baby, though the head was rather large

CASE 9 (No 17750, Chart 4)—*History*—H, girl, was born Nov 20, 1919, with breech presentation, version and extraction

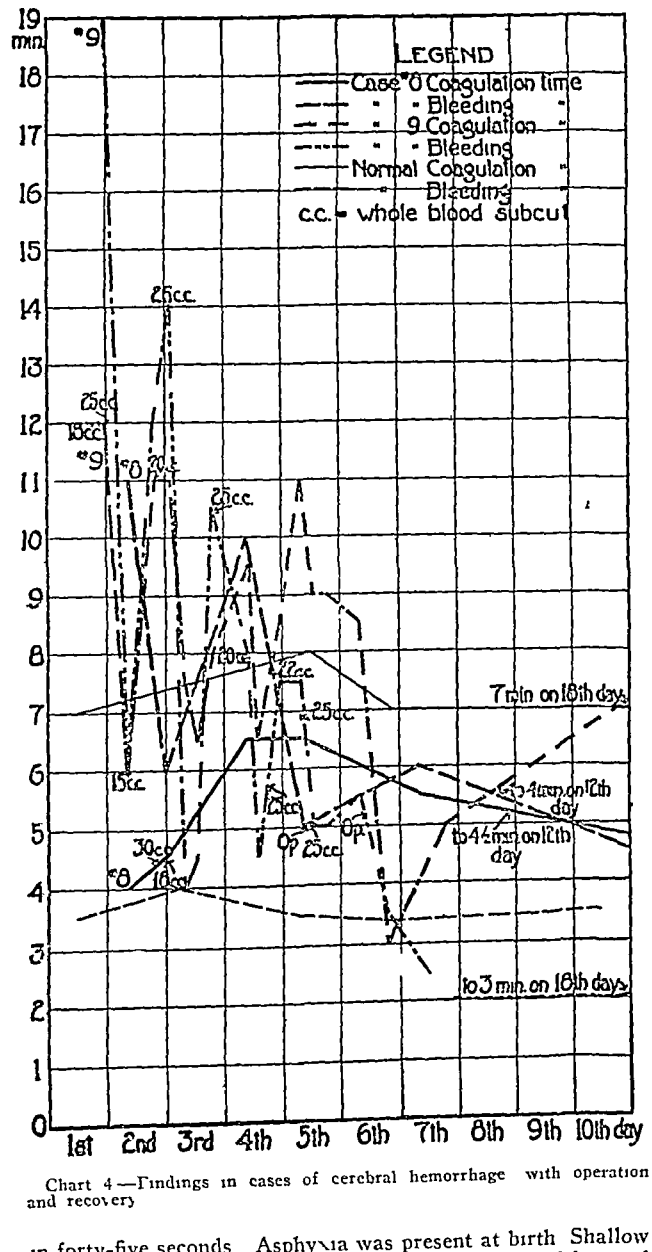

Chart 4.—Findings in cases of cerebral hemorrhage with operation and recovery

in forty-five seconds Asphyxia was present at birth Shallow breathing, overriding of parietal bones and bulging of fontanel were noted The patient was given stimulants The coagulation time was twelve minutes, the bleeding time, nineteen minutes The patient was given 43 c c of blood November 21, the general condition was better except for pallor The coagulation time was six minutes, the bleeding time, six minutes Fifteen c c of blood was given November 22, the patient had convulsions, she was given 25 c c of blood twice during the day November 23, she had convulsions from every five to fifteen minutes, with sharp piercing cries The coagulation time was six minutes the bleeding time, ten minutes Twenty c c of blood was given Later the patient was given 25 c c November 24, the patient had difficulty in swallowing There were no localizing symptoms The coagulation time was eleven minutes, the bleeding time, seven and one-half minutes Twenty-five c c of blood was given, November 25, 25 c c of blood was given The coagulation time was eight and one-half minutes, the bleeding time, five and one-half minutes A decompression operation was performed by Dr A C Strachauer His notes state "On incising dura, brain bulged, great pressure, bleeding possibly on other side" After operation, the coalugation time was three minutes, the bleeding time, three and one half minutes This striking reduction in time almost immediately after operation may have to do with intracranial manipulation with the release of cephalin November 26, the patient was much improved, the coagulation time was six minutes, the bleeding time, two and one-half minutes The patient was discharged on the twenty-seventh day in excellent condition showing a gain of 800 gm over the birth weight

Present Condition—At 4 months she weighed 14 pounds and appeared perfectly normal

COMMENT

Cases 8 and 9 illustrate the brilliant results of surgery It may also be concluded that the early and repeated injections of blood controlled the tendency to hemorrhage and contributed to the surgical success

Analyses of these cases show that administration of blood subcutaneously is capable of bringing the blood coagulation reaction back to normal This in certain cases may be curative, especially if resorted to early It may be a necessity if surgery is contemplated, for early operation in the face of uncontrolled hemorrhagic tendencies is a great risk Otherwise, late operations after eight or ten days may be undertaken if the child survives to this time, since the blood reactions are then usually normal

Bulging fontanel, respiratory and cardiac disturbances, spasticities and convulsions, the classical signs of cerebral hemorrhage, may present themselves late in the disease or not at all Prolonged coagulation time and a protracted bleeding time suggest the disturbance It is now a routine in our clinic to determine these factors early and to administer blood repeatedly if delay is found

It seems justifiable to conclude that the etiology of cerebral hemorrhage is complex

(*a*) Severe trauma with resulting rupture of large veins, or sinuses, or tearing of the tentorium produces massive hemorrhages with death at delivery or within the first few hours

(b) Mild trauma may produce hemorrhages also, but the condition of the new-born blood enters into consideration

1 If the coagulation and bleeding times are normal, recovery may take place Kundrat,[15] in necropsies on children several weeks old in whom cerebral hemorrhage had not been suspected, reported blood pigment and signs of old hemorrhage

2 If the blood shows prolonged coagulation and bleeding times, hemorrhage may be progressive over days until intracranial pressure is increased to the extent of producing symptoms, and if longer continued and not relieved, death ensues

Hemorrhagic tendencies in the new-born may be latent until an abrasion of the skin, opening of a hematoma, the forcible removal of the cord, or circumcision gives occasion for protracted bleeding Likewise the rupture or break in some small vein over the brain surface supplies the impulse for the hemorrhage,

15 Kundrat Ueber die intermeningealen Blutungen Neugeborener Wien klin Wchn chr 2 887 1890

if the hemorrhagic tendency is present In our work, it was found in hemorrhagic conditions that the bleeding point was often occluded by a soft clot—movement of the limb or contact with bedding often displaced the clot and induced a fresh hemorrhage Such a clot in a cerebral vessel could easily suffer dislodgment from crying or vomiting, with renewal of the bleeding This explains the protracted steplike progress seen in many cases of cerebral hemorrhage

CONCLUSIONS

1 Cerebral hemorrhage is a frequent occurrence in the new-born, and the most frequent cause of death in the first days of life

2 Cerebral hemorrhage is not always caused by obstetric operations, it may follow normal labors when least expected

3 Severe trauma results in massive hemorrhages and early death

4 A more frequent cause of cerebral hemorrhage is mild trauma plus hemorrhagic disease of the newborn, accompanied by findings of delayed coagulation time and prolonged bleeding time

5 A delayed coagulation time and prolonged bleeding time can be controlled by the subcutaneous injection of whole blood This is a rational therapy in cerebral hemorrhage

6 In severe cases, surgery should be employed early, operation should be controlled by blood studies and the injection of blood if indicated

7 The coagulation time and bleeding time should be determined in every new-born presenting unusual symptoms, or better, as a matter of routine If reactions are delayed, blood should be administered

The Children's Clinic, 1717 First Avenue, South

ABSTRACT OF DISCUSSION

DR ISAAC A ABT Chicago We are accustomed to think of meningeal hemorrhages in the new-born as the result of trauma, and we frequently blame the obstetrician for the damage when he is not responsible The most frequent causes of meningeal hemorrhage have already been mentioned We frequently encounter cases in which meningeal hemorrhage results on the fourth or fifth day and I have thought that this was due to a trauma during labor Dr Rodda pointed out however that the hemorrhage may occur as the result of a constitutional state or on account of the fragility of the blood vessel walls Dr Rodda has established a normal coagulation time for the blood of the new-born infant and also worked out the normal bleeding time He has shown conclusively that a certain number of babies bleed without having received any birth injury Babies with meningeal hemorrhage bleed slightly at first though later on a continuous oozing occurs leading to the accumulation of a considerable quantity of blood If we detect a tendency toward bleeding, or if we recognize the fact that oozing is going on, by Dr Rodda's method of determining the coagulation time we will be able to control the hemorrhage Considering the severity of these cases particularly the after effects on the nervous system localization of the hemorrhage should be attempted and surgical treatment should be advised If nothing else can be done a decompression may be produced by operation and possibly the severe results of pressure on the cerebral cortex and the destruction of cells with subsequent degenerative processes may be prevented Of course, there are those who will say at once that there is sufficient decompression already on account of the natural structure of the infant's skull, but when there is continued oozing the subarachnoid space soon becomes distended, the dura may be incised so as to prevent this overfilling and to relieve compression

DR JOHN FOOTE, Washington, D C The work Dr Rodda has reported on is extremely important, particularly so in view of the observations made by Ballantyne of Edinburgh on the influence of the neonatal death rate on the general infant mortality rate We have here the condition which necropsy findings have shown to be the cause of perhaps 50 per cent of deaths in the new-born within the first few days of life That has been the result of Dr Warwick's observations at the University of Minnesota and by Wehe and Kundrat who have done similar work Not only that, but this condition has been found in routine necropsies on a large number of infants in whom none of the classical symptoms of cranial hemorrhage had appeared So we can realize its great importance Dr Rodda has standardized the method by which we may obtain definite knowledge within reasonable limits of the normal coagulation time of infants' blood I have been impressed with the importance of this subject for a long time Three years ago, in discussing Dr Brady's paper I stated that in my opinion hemorrhage within the cranium of infants could be and frequently was the result of a general hemorrhagic tendency I have sometimes found it necessary to use thromboplastin or horse serum or blood to induce coagulation I have obtained very good results with other agents than blood Some men do not care to use human blood unless they have the proper hemisoagglutination group of donor Whenever I think of that term I am reminded of what George Eliot said that we cover up our ignorance with long Greek names" Whole blood may be injected under the skin regardless of grouping rules

DR HOWARD B HAMILTON Omaha We need to remember not only the frightful mortality attendant on this condition but also the frightful morbidity When we see these children later with their deformities of a physical or mental and perhaps even of a moral character it gives us food for thought I have seen some cases due to the use of pituitary extract The unfortunate results whether those of mortality or morbidity are such that extreme measures are justified If there are localizing symptoms it seems more than justifiable to operate If there are those cases which give evidence of pressure but without localizing symptoms some one has suggested the utility and the feasibility of doing repeated lumbar punctures and has reported some cases in which benefit was obtained by so doing Some one advised going into the cisternae at the base of the brain through the foramen magnum which seems to be rather a formidable procedure but if there is any hope of doing anything for these patients it would be justifiable because the results otherwise are of such an unfortunate character that it would seem better to lose the patient with an unsuccessful operation than to have him live in the condition in which many of them are left

DR F C RODDA, Minneapolis We were greatly impressed with the frequency of cerebral hemorrhage in the new-born In our studies of more than fifty necropsies over half of them showed cerebral hemorrhage We were at a loss to explain why hemorrhages were so frequent following normal labors why there was delay in the onset of symptoms as long as five or six days and why they frequently accompanied multiple hemorrhages throughout the body In our studies in determining the coagulation time we found repeatedly in hemorrhagic cases that the puncture point in the heel was closed with a very soft clot This was easily displaced by movement of the limb and bleeding frequently recurred We feel the situation is somewhat similar in cerebral hemorrhages that the break in a very small vein is occluded by a soft insecure clot which becomes displaced by vomiting or crying with subsequent renewal of bleeding This may explain in part the delayed and steplike progress in many cases of cerebral hemorrhage Lumbar puncture may give results if the bleeding is below the tentorium, if the bleeding is supertentorial one can anticipate little benefit from this procedure Surgery to be of greatest benefit must be resorted to within the first days of life Early surgery must be controlled by studies of the coagulation time If the time is delayed blood should be injected It would be a formidable operation to attempt surgery in the face of a profound hemorrhagic tendency such as many of these babes present If the operation is delayed from ten to fourteen days then the injection of blood is no essential since the hemorrhagic tendency is overcome early in the infant's life

THE TEMPORARY TEETH*

J ROSS SNYDER, M D
BIRMINGHAM, ALA

Seventeen years ago the American Medical Association met in this city, and at that meeting there occurred in this section a lively discussion on the subject of the toilet of the nasopharynx I recall no word said during that discussion to indicate that any one then present realized the close relationship between the condition of a child's teeth and the nasopharynx

Shortly after returning from that meeting I was the consultant in the case of a 7-year old girl who was pallid, had a rapid pulse and accelerated respirations, had been losing weight, was without appetite, and had low grade fever After what I considered a careful examination I concurred in a diagnosis of tuberculosis The family asked for further consultation with an eminent surgeon The physician in charge and his consultant objected on the ground that the case was medical, not surgical This resulted in both being asked to resign from the case The surgeon was then called in and discovered a gumboil at the site of the first permanent molar, the latter decayed With proper treatment of the mouth condition the tuberculosis disappeared magically The girl today is a fine specimen of healthy young woman, but she has a crooked face—all of which is recited to bring out several points, but chiefly to introduce an inquiry as to why pediatric men continue to ignore the subject of dental pediatrics

I find very little evidence in the subsequent transactions of this section or of any other organization of pediatricians, or in the monographs or in the textbooks of its members, to indicate that due consideration is being given to the subjects of oral hygiene and oral prophylaxis Can we afford longer to dismiss from our deliberations subjects such as these which are not merely related to pediatrics but are definitely a part of pediatrics?

A favorite complaint from pediatricians has been that the government gives more attention to the breeding of cattle than to the breeding of a race Such a complaint is hardly consistent when through our efforts huge sums are being spent on the cow's toilet, though we ignore the importance of a toilet for the child's mouth

Thomas of Minneapolis damns the family dentist who dismisses the little child with the statement "Oh! I can't do anything with those teeth, they are only temporary and your child will have permanent teeth in their stead" He says the man who first called the deciduous teeth the "temporary" teeth committed a crime against children which only years of painstaking education can eradicate I agree with him Probably each of us has experienced much difficulty in securing proper dental care for our little patients I have at times been explosively impatient with dentists I realize, however, that dentists are only human and that they are not entirely responsible for conditions now existing wherein the child is denied proper dental rights Dentists are not to be too much blamed if they give chief attention and most of their time to the seemingly more imperative and the decidedly more lucrative demands on their profession So many adults in our population have mouths in a deplorable condition that if every dentist in the land were to work twenty hours a day, each could be kept busy with needed reparative and reconstructive work, and there would still be many persons compelled to go unattended The demand along this line far exceeds the supply

Notwithstanding notable exceptions such as Fones of Bridgeport, Forsythe of Boston, Ebersole of Cleveland, Oakman, Griffin and Burke of Detroit, Thomas of Minneapolis, Belcher and Burkhart of Rochester Maud Tanner of Portland and a few others, the majority of dentists have neither the time nor the inclination properly to treat temporary teeth The dental profession not only admits but insists on the importance and the necessity of oral hygiene and prophylaxis But just so long as there is a paucity of dentists, so long as the grown man or woman with the toothache can out halloo the child, so long as the adult furnishes the coin, dentists cannot be expected to scramble around and over each other in eagerness to attend to the child's mouth It simply is not done

By way of parenthesis I wish to say in justice to the dental profession that the latter embraces as many selfsacrificing, unselfish and philanthropic individuals as does the medical profession—but each has a goodly majority which is looking out for the main chance

It has been estimated that in spite of antenatal conditions and quite independent of the state of the teeth of parents, the temporary teeth emerge through the gums to all intent and purposes perfect in 98 per cent of children Contrast this with the condition of the teeth of children of school age Leak, New York State dental inspector, says

> Ninety per cent of children in the first grades, not only in the slums but in aristocratic and best sections of cities, have bad teeth, one third have abscessed conditions in their mouths and every fourth or fifth child does not have proper masticating surfaces Of little tots in the first grades 7 years of age, 40 per cent have the six-year molar decayed—a tooth which has not been in the mouth more than one year and yet the first molar of the permanent set decayed

Equally bad conditions have been revealed wherever inspections of the mouths of the schoolchildren have been made

It ought not to be necessary for me to dwell at great length on the dangers to health and on the economical waste which result from such conditions

Pediatricians everywhere have contended for the rights of the child to a clean, wholesome food supply A vast amount of time, energy and money has been expended through our efforts on a propaganda for pure food, clean handling and sterile utensils and conditions Meanwhile, we are overlooking one of the most frequent sources of contamination—the child's mouth, "the mixing chamber of the food" as some one has aptly expressed it Certainly, food cannot pass clean into the stomach through a foul mouth Besides many gastro-intestinal disturbances which can be traced directly to this source, an unclean mouth is often responsible for diseased tonsils and other diseased glands Filth breeds filth both inside and outside the body

It has been conclusively demonstrated that children with bad teeth are more susceptible to infectious diseases

Granting, as Hellman suggests, that there should be a more scientific investigation of the causes of mal-

* Read before the Section on Diseases of Children at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

occlusion, that "the condition should be studied from a developmental, racial, pathologic and nutritional standpoint," this does not preclude the already arrived at conclusion that premature loss of the deciduous teeth is the most frequent etiologic factor in maldevelopment of the face and the jaws

Lest the intent of this paper be lost by provoking a discussion on focal infections, I omit case reports I am not in the least concerned whether you accept or deny that "the elective localizing powers of streptococci in various types in dental infections have been demonstrated" I am concerned as to whether we, an organized body of pediatricians, admit that there are in our country millions of children whose health is in more or less jeopardy because of their unclean mouths Probably a majority of these children display no strikingly marked symptom There may be no pain, no elevation of temperature, no acceleration of pulse rate, no cough, no glandular swelling, no albuminuria, nothing to attract the attention of the ordinary physician, dentist or parent Many of these children, however, do display symptoms which to the pediatrician ought to be pregnant with significance The child may not show a proper interest in things that are attractive to the normal child The appetite may be capricious, the child often spurning good wholesome food while craving sweets He may be as reluctant to go to bed at night as to get up in the morning He may be nervous and fidgety or lethargic, he may be emotional or apathetic, he may be precocious or a dullard, sometimes he is incorrigible To the uncommonly observant, many indications are apparent of the child's being below standard—sometimes mentally, sometimes physically, sometimes in both ways

Fones once said

> If our large steel plants and rolling mills were obliged to reroll from 20 to 35 per cent of their stock, it would not take them very long to find out what was the matter No business nowadays could stand such a high percentage of loss in doing its work over again In our public schools throughout the country, it is a fair estimate to say that the percentage of grammar schoolchildren who are reviewing their grade will range between 20 and 35 per cent In a majority of cities the average will be nearer the latter figure

This statement was made in 1913 When Fones was enabled in 1914 to introduce oral hygiene into the schools of Bridgeport, what he actually found was that 40 per cent of the entire educational budget was being spent on reeducation After five years of mouth hygiene in the school this was reduced 50 per cent, only 17 per cent of the budget being required for the purpose of reeducation

In every community in which oral hygiene has been introduced as a part of the school system, not merely satisfactory but brilliant results have followed It has always meant cleaner, better, happier and more intelligent girls and boys This state of well being is reflected not only on the teachers but on the parents as well At present oral hygiene has been adopted so exceptionally by school boards that communities in which it exists stand out in marked contrast with their benighted neighbors Why is it that a system for which so much can be claimed does not become universally adopted by schools? The ardent souls who have approached appropriation boards advocating oral hygiene have been able to present forceful arguments, they have had no difficulty in proving their case, yet few have succeeded in obtaining the necessary funds

Appropriation boards are too often skeptical of the purposes of a demand which originates and is supported almost solely by dentists or physicians

While there is no question about the desirability of having oral hygiene made a part of every school system, this desirability will hardly be realized until the campaign for funds gains sufficient momentum to overcome the natural reluctance and skepticism of appropriation boards If there is any better way to do this than by getting parents back of the movement, it has not suggested itself to me Even if they had the inclination, dentists have little opportunity to present the matter to parents Compared with physicians, especially pediatricians, dentists have access to but few homes When the child is taken to the dentist it is usually only after toothache has developed, at which time injury—often irreparable injury—to tooth or teeth has been suffered If oral hygiene and prophylaxis only meant brushing the teeth and keeping the mouth clean, pediatric men ought even then to lend cordial support to the movement The question is broader, in that diet plays an important role as an etiologic factor in the development of caries Dentists who are specializing on children's teeth are emphatic in their assertion that, given the care of the child young enough, they can, with the intelligent cooperation of a pediatrician, reduce diseased pulps and caries to almost nil Parents are entitled to education along this line I hope the members of this section will individually and collectively resolve to stop putting the burden altogether on the dentists

---

ABSTRACT OF DISCUSSION

DR JULIUS SEDGWICK Minneapolis We can often clear up the diagnosis in obscure cases by examining the teeth carefully A child from Oklahoma was believed to have malaria The organism of malaria could not be found The teeth were cared for and the supposed malaria disappeared We have in each of our clinics a staff dentist who examines any case in which the teeth cannot easily be excluded as the cause of trouble As a prophylactic measure, we have the children sent to the dentist regularly before they have any trouble The dentist associated with us makes a specialty of the teeth of children I think this is very important and it is hard to understand why it has been so long neglected

DR ISAAC A ABT Chicago If the teeth are not properly cared for, if oral prophylaxis is neglected, then the teeth decay or produce abscesses and the question of extraction is raised Most dentists hesitate at extracting these temporary teeth because no room is left in the arch for the eruption of the permanent teeth and deformity and malocclusion result They are right Certain diseases in infancy affect not only the temporary teeth but also the permanent teeth Some years ago I reported a number of cases of tetany in infancy causing in later life enamel erosions of the permanent teeth This whole question deserves further consideration and I would suggest that some one should investigate the whole subject of the relation of decayed teeth to malnutrition pointing out the effects of decayed and neglected teeth on nutrition growth development condition of the blood and other organs

DR W L FUNKHOUSER Atlanta Ga Prevention and the early detection of malocclusion in the temporary teeth is a responsibility we must assume To do this we must recognize the forces which prevent and the causes which produce malocclusion If we will recognize these cases early and have them referred to the orthodontist at once we will preserve for our little patients a normal masticatory and breathing apparatus

DR. LAURENCE R DE BUYS New Orleans The care of the teeth should begin when the first tooth erupts To prevent, as

parents wait until several teeth are out of order to begin the dental hygiene I have been impressed with finding a continuously slightly elevated temperature in children who have had carious teeth over a prolonged period Whenever a mouth shows carious teeth, the oral temperature should absolutely be disregarded, and the rectal temperature be the guide In making comparative observations in these cases, even after the teeth have been removed, between the mouth and the rectal temperature, we are often apt to find the rectal temperature at its normal at 99 6 F and the mouth temperature elevated to 99 or 99 6 F It is far better practice to extract the carious teeth or the carious permanent teeth even at the risk of a resulting malocclusion, than not to do so and expose the individual to the many conditions which may result therefrom and which might permanently either partially or completely incapacitate him Malocclusion, if it should occur, may easily be corrected later

Dr Fritz B Talbot, Boston Dr Abt mentioned that children who have had tetany have poorly developed teeth The recent work of Howland and Marriott on blood examinations in these cases, and Dr Denis and I have confirmed the work in a large number of cases, shows that the blood in acute tetany contains a very diminished amount of calcium during the acute stages of the disease Of course, the teeth are formed principally from calcium

Dr C F Wahrer, Fort Madison, Iowa The dental association of Iowa passed a resolution two years ago to the effect that they were not going to take orders from any physician, because they knew more about what should be done for a child's teeth, no matter how badly diseased, and what influence they might have on focal infection, than the doctor So strongly is this opinion held in our state that I had to go finally to the State University to find a dentist who would extract some teeth for my wife, in order to prevent her eyesight from being totally ruined Between extremes lies an immense amount of truth, and by papers and discussion of this kind, and the use of good judgment and available literature we surely can arrive at the truth of what will be necessary for the child

Dr. E C Fleischner, San Francisco I have numerous children brought to me with the same statement that the dentist said the teeth are too poor to fill, but he does not want to pull them because of the effect on the eruption of the permanent teeth I tell every one of those mothers that every tooth is either good enough to fill or poor enough to pull I have stated that before state dental societies, county dental societies and local dental societies, and I never have found a dentist with sufficient courage of his convictions to challenge that statement A carious tooth which cannot be filled corresponds absolutely to a sequestrum of bone It is contrary to all known surgical principles to leave a sequestrum anywhere in the body Why should an exception be made in the case of the temporary teeth?

Dr J Ross Snyder, Birmingham, Ala We should talk about prophylaxis and oral hygiene more in pediatric societies I do not think we ought to begin to condemn or apologize for the dentists until we take a little more action ourselves

---

Overconsumption of Sugar—The observation of Garner on monkeys that they prefer acid fruits when in the wild state but when in captivity soon become enthusiastic about sweets points to sweet eating as a habit There can be no question as to the important place which carbohydrates must always hold in the diet since with fats they furnish a very large proportion of the energy required, nor can we disregard the value of sugar itself when taken in moderation and with regularity and, under certain unusual conditions, in large amounts There seems, however, to be no proof that sugar is absolutely essential after the period of infancy, when its presence in considerable amount in the milk of the nursing mother points to its necessity in the early months before the digestive processes have become able to convert starches but after this digestive ability is established there is every reason to believe that the effort required in the conversion of starches is of benefit to the development and maintenance of the digestive processes and that added sugar tends to impair these functions—F Van der Bogert, *Albany M Ann*, June 1920

SOME OBSERVATIONS ON THE PHARMACOLOGY OF A DIGITALIS BODY*

ROBERT A HATCHER, M D
NEW YORK

The investigation with which this paper deals was started with a view to preparing a digitalis principle in a form suitable for intravenous administration following numerous inquiries concerning such a preparation There seems, however, to be a more imperative need of one which is absorbed from the gastro-intestinal tract with greater uniformity than are the tinctures or other preparations made from digitalis obtained from a variety of sources and including wild grown and cultivated American, English and German leaves, partly from the first year's growth, partly from the second, and dried in a variety of ways

The need of such a readily absorbable preparation has been called to my attention by the complaints of clinicians who were unable to secure the typical effects of digitalis even with large doses of the tincture in use in the hospitals with which they are associated Several of these tinctures were submitted for examination, and in every case the biologic test showed that they were of a fair degree of activity

Certain of the digitalis principles are readily absorbable from the gastro-intestinal tract of man, as well as that of animals, while others are absorbed much less readily, and it seems probable that the failures just mentioned arose from the fact that the preparations contained relatively large proportions of the less readily absorbable active principles

A preliminary report[1] of a method of separating the more readily absorbable principles from those which are less readily absorbable was made about a year ago to the American Pharmaceutical Association Since then modifications of that method have been employed in the effort to separate the more absorbable fraction in pure form and to estimate the amount in the leaf or tincture quantitatively The substance obtained by the several modifications of the method is essentially the same, though it differs somewhat in purity The simplest process for obtaining it consists in placing the wetted ground digitalis on a filter paper resting in water and supported by a wire frame, with a layer of chloroform beneath the water The active principles of the leaf pass into the water by circulatory solution, and the chloroform takes up the more absorbable fraction, leaving the less absorbable in the water The chloroform is then evaporated spontaneously, no heat or chemicals being used at any stage of the operation

There is so much uncertainty regarding the chemistry of digitalis that any attempt at a comprehensive discussion of the subject would be out of place here, but certain salient points of resemblance between this chloroform-soluble substance and digitoxin, and certain dissimilarities may be pointed out It is now generally accepted that digitalis contains digitoxin, digitalin, and one or two other active principles Digitoxin is the only one of these that is soluble in chloroform, while all are readily soluble in alcohol, and none except the ill-defined digitalein is easily soluble in water Nevertheless, water extracts all of the active

* This investigation has been made with the assistance of a grant from the Committee on Therapeutic Research Council on Pharmacy and Chemistry American Medical Association

1 Hatcher R A J Am Pharm A 8 913 1919

principles of digitalis almost as readily as alcohol, a circumstance that affords evidence that these principles exist in the leaf in combination, and not in the free state as we know them

The chloroform-soluble substance resembles digitoxin to a certain degree, both chemically and pharmacologically, and it seems probable that it contains *combined digitoxin, though not* in its original combination, because when once it is separated the substance is much less soluble in water than before, and furthermore, when it is separated there remains another substance which is no longer soluble in water, and which is evidently thrown out of solution by the removal of the chloroform-soluble fraction

The chloroform-soluble substance is resinous in character, brittle when cold, but softening with heat, it has a fragrant odor and an intensely bitter taste, it is soluble in chloroform and in alcohol in all proportions, and when water is added to a not too concentrated alcoholic solution the mixture remains clear or slightly fluorescent, though the substance is only slightly soluble in water, it is insoluble in petroleum benzin and in anhydrous ether, but ether dissolves a part of some specimens, leaving a part which is nearly indistinguishable in appearance and in pharmacologic action from the more soluble portion If a fragment is dissolved in glacial acetid acid, a trace of ferric chlorid added and the solution allowed to flow over an equal volume of sulphuric acid contained in a test tube, without mixing, a dark zone appears at the line of contact, and the acetic acid gradually assumes a green, and then a blue, color, gradually fading to a dirty appearance, the reaction being identical with that given by digitoxin except that in addition the chloroform-soluble substance gives a ruby red color in the upper part of the sulphuric acid

The behavior of digitoxin following its subcutaneous injection in the rat is peculiar, in that the animal, which excretes certain other digitalis bodies (ouabain and amorphous strophanthin) with extraordinary rapidity, shows a peculiar train of symptoms in which clonic convulsions are prominent, lasting for a period of about a week with just fatal doses The symptoms following the subcutaneous injection of a just fatal dose of the chloroform-soluble substance are indistinguishable from those following similarly active doses of digitoxin The rabbit eliminates a nearly fatal dose of digitoxin in a period of two or three hours in marked contrast to the cat and rat It is significant that the chloroform-soluble substance is also eliminated by the rabbit at almost exactly the *same rate as digitoxin Such striking similarities of* behavior in these two animals can hardly be a mere coincidence The accompanying table gives certain points of resemblance between this chloroform-soluble substance and digitoxin

One who has never worked with digitalis or other drug of similar complexity can have no adequate comprehension of the extraordinary variety of compounds which are obtained with slight variations in the method of extraction while the changes in solubility of the active principles in different menstruums resulting from slight differences in the impurities present, are confusing at times

In marked contrast to the ease with which these combinations are broken down or altered is the stability of the most active of the principles which resists long continued boiling in weakly acid or neutral solution, and which I have obtained from a specimen of the fluid extract which had stood for nearly forty years The active substance is associated with a saponin-like material, the greater part of which is separated easily but the last traces of which are removed only with some difficulty It is difficult to remove traces of chlorophyl with which it is sometimes contaminated

It was earnestly hoped that a method might be perfected for the quantitative determination of the chloroform-soluble fraction in digitalis leaves or the tincture in order that the dosage might be determined with reference to the content of this readily absorbable fraction, but the effort has not been successful It appears to be merely a question of overcoming certain difficulties, and it is hoped that a satisfactory method of doing this may be devised

The chloroform-soluble, or more absorbable, fraction and the aqueous residue, containing the less absorbable digitalis principles, are capable of exerting the typical digitalis action as shown on the frog, in

COMPARISON OF THE CHLOROFORM SOLUBLE FRACTION OF DIGITALIS WITH DIGITOXIN

	Digitoxin	Chloroform Soluble Substance
	White crystalline powder	Greenish resinous
	Melts at 240 C	Melts gradually at about 100 C
	Odorless	Fragrant
	Intensely bitter	Intensely bitter
	Solubilities	
Alcohol	Easily soluble	Very soluble
Chloroform	Very soluble	Very soluble
Ether	Insoluble	Insoluble
Petroleum benzin	Insoluble	Insoluble
Water	Insoluble	Nearly insoluble
Color reaction	Positive	Positive (with ruby red)
Action in rat	Peculiar hyperexcitability	Indistinguishable from that of digitoxin
Elimination rabbit	Extraordinarily rapid	Extraordinarily rapid
	Fatal dose per kilogram (Approximate)	
Cat vein	0 35 to 0 5 mg	1 0 mg
Rabbit vein	1 0 mg	2 5 mg
Frog lymph sac	8 5 mg	10 mg

which they induce ventricular systolic standstill, preceded by slowing, irregularity and dissociation of auricles and ventricle, and also by an electrocardiogram (for which I am indebted to Dr R Edwin Morris of the University of Minnesota) which shows a typical lengthening of the P-R interval with small doses and complete dissociation of the auricles and ventricles with large doses, together with a gradual flattening and inversion of the T wave in the cat It also causes emesis through stimulation of the vomiting center in the cat and dog

The relative absorbability of the two fractions (the chloroform-soluble, and the chloroform-insoluble) was studied in the following manner They were assayed biologically by the cat method, which determines the amount required per kilogram of weight when injected intravenously to kill the animal, such an amount being called for convenience a cat unit The fractions were then administered to cats through a stomach tube in doses varying from one to four cat units per kilogram of weight and the symptoms induced were observed The results were not uniform but the chloroform-soluble fracti[illegible] be[illegible]d the more readily absor[illegible] friction is relatively [illegible] residue apparently,

30 per cent of the average fatal dose of the residue causing emesis in cats, while about 40 per cent of the average fatal dose of the chloroform-soluble fraction is required, but the oral doses of as little as one cat unit per kilogram of weight of this fraction usually caused emesis in a short time, whereas oral doses of three and four cat units per kilogram of the aqueous residue sometimes failed to produce any perceptible symptoms On the other hand, the absorption of the aqueous residue was more irregular than that of the chloroform-soluble fraction, and of two animals that received one, and two and a half, cat units per kilogram, respectively, of the same specimen of the residue the one receiving the smaller dose was nauseated and depressed while the other showed no perceptible effects The persistence of action in each case was determined on the following day by the differential test with ouabain (difference between the average fatal dose for a normal animal and that actually required for these cats), and while a single test is not conclusive, the results supported the evidence of absorption just mentioned, the cat which received the larger dose of the aqueous residue required much less of the ouabain than the one which had had the smaller dose It may be remarked parenthetically, that we have found that the absorbability of several of the digitalis bodies from the gastro-intestinal tract of the cat closely parallels that observed in man

An effort was made to estimate the relative amounts of the two fractions in a tincture and in a fluidextract which had been sent for examination because of their failure to induce the typical digitalis actions in man when used clinically in large amounts Though it is impossible to separate these fractions quantitatively, it is at least significant that both of these preparations yielded very low percentages of the more absorbable fraction, and there is little reason to doubt that this fact explains why they proved ineffective in man

We are especially concerned with the uniformity of action of the tinctures which we use by any given method of administration, and not with the presence in them of a variety of substances, including acids, volatile oils, saponins, resins, chlorophyl, sugar and coloring matter not to mention different active principles of unknown and varying degrees of activity, but since different tinctures vary in their absorbability, and therefore in their activity when administered orally, even though they may be of uniform activity when tested biologically, there is need of a preparation of as nearly uniform absorbability and activity as can be obtained I wish to lay special stress on the fact that if one could always use the same tincture of digitalis, one would encounter little difficulty with its use after he had learned the dose, and he would probably never have an occasion to use such a preparation as the one now under consideration

It is with this fact in mind that I present this paper dealing with a substance which I believe to be the most active principle of digitalis in a form more closely resembling that in which it exists in the leaf than any that has been prepared hitherto

A digitalis body [2] designed for intramuscular or intravenous injection must meet the following requirements It must be soluble in water, or at least in a weakly alcoholic menstruum, it must be of uniform activity, it must exert a minimum of undesired side actions, it must not deteriorate rapidly, and it must not irritate the veins or tissues into which it is injected

It is commonly assumed that the highest degree of purity is essential for a preparation which is injected intravenously, but while such a degree of purity is highly desirable, it is not an essential, provided the impurities present are not injurious Tinctures of digitalis from different sources vary widely in their composition, nevertheless they have been injected intravenously with apparently satisfactory results If clinicians have felt impelled to use the tincture in this way despite its disadvantages, it is obvious that any true digitalis body which possesses the essentials already mentioned must be preferable to the tincture

The chloroform-soluble substance meets the first of these requirements in that it is readily soluble in alcohol and is then readily miscible with water, the solution thus formed being fairly stable, the uniformity of activity is assured by the biologic assay, it is about as actively emetic as tincture of digitalis, certainly not materially more so so far as can be determined it does not deteriorate more rapidly than tincture of digitalis, the veins of cats were examined some days after toxic doses had been injected into them and found to be free from evidences of irritation, and numerous doses were injected into one of the ear veins of a rabbit during a period of several weeks No evidences of pain could be elicited following the intramuscular injection into cats, but the following experiment on man is worthy of notice An eighth of a milligram of the active substance, equal to an eighth of a cat unit, in 2,000 parts of physiologic sodium chlorid solution containing about 10 per cent of alcohol, was injected into the deltoid (of the author) After about ten minutes there was a slight burning pain lasting for about twenty minutes When this had become imperceptible during rest, a sudden violent movement of the arm was made with the purpose of determining whether pain could be elicited There was a sharp burning pain lasting a minute or two, but this could not be elicited on repeating the movement There was a slight sense of soreness during the following twenty-four hours when the arm was used, but this was not sufficient to attract the notice The deltoid is more sensitive than the gluteus, but the dose was much smaller than that required for the full therapeutic effects, hence it is impossible to state whether the pain of the intramuscular injection of a therapeutic dose into the gluteal or lumbar region would be too painful or not

From the foregoing it seems reasonable to conclude that the weakly alcoholic solution is suitable for intravenous, and possibly for intramuscular, injection in man, but that its ready absorbability following the oral administration renders other modes of administration superfluous in nearly all cases

SUMMARY

Water exhausts ground digitalis leaves, and from the infusion thus prepared chloroform removes a principle which resembles digitoxin somewhat, both chemically and pharmacologically, and which is more readily absorbable from the gastro-intestinal tract of the cat than is the residue remaining in the infusion

The chloroform-soluble substance is soluble in alcohol, and the alcoholic solution is miscible with

2 While the terms digitalis body and principle are used in this paper it is to be understood distinctly that the substance under consideration is not an alkaloid or glucosid in pure form The substance probably consist of digitoxin mainly and it is probable in combination much as it exists in the leaf although this is only a surmise

water without precipitation, the weakly alcoholic solution undergoing little change in a period of about a year during which it has been under observation

It is a true digitalis body, in that it exerts the typical cardiac action of the latter It is not more actively emetic than is digitalis in proportion to its therapeutic effects

It is believed that it is suitable for intravenous, and probably for intramuscular, injection, in the relatively few cases in which such methods of administration may be necessary

It is hoped that a way may be found to estimate the amount of this readily absorbable fraction in digitalis so that the powdered drug, the tincture or the infusion may be used instead of this chloroform-soluble fraction, which is naturally more expensive than the official preparations

Further pharmacologic studies of the substance are in progress in the hope that the preparation may be made official, should the clinical studies show that it possesses any advantages over the official tincture

THE ABSORPTION OF A DIGITALIS BODY

PRELIMINARY OBSERVATIONS*

CARY EGGLESTON, M D
NEW YORK

The greatest diversity of opinion exists relative to the rate and completeness of absorption of digitalis from the human alimentary canal, and very few accurate observations have been made in this important field In a study of the dosage of digitalis [1] published five years ago, it was shown that the tincture and the infusion, and commercial crystalline digitoxin, were generally absorbed both rapidly and fairly uniformly from the gastro-intestinal tract of man when adequate doses were administered The precise rate of absorption was not determined, but the fact was brought out that the absorption of a single dose of digitalis was apparently complete within about six hours after its ingestion It was also proved that full digitalization could be brought about by oral administration within from ten to twenty hours from the beginning of treatment These observations have been confirmed by White and Morris,[2] and by Robinson [3]

Robinson showed that the initial effects of digitalis appear in from two to five hours after the oral administration of a single large dose of the tincture, and in an unpublished report on the rapidity of absorption of digitalis from the digestive tract of man, H E B Pardee concluded from his observations that the absorption of a single dose of the tincture is practically complete in about six hours, while a marked degree of absorption is almost always demonstrable in from two to four hours

These and other observations indicate that, as a general rule, digitalis is rapidly and fairly well absorbed from the human alimentary tract, and the fact that an average oral dose could be established shows that absorption generally takes place with a considerable degree of uniformity This is borne out by an analysis of the full therapeutic doses recorded in sixty-six cases representing all forms of heart disease, collected from the papers of Pardee [4] and myself, in which only two, or 3 per cent, of the patients showed excessive variation from the average, and in both of these the administration was continued over a considerable period of time One of these patients required nearly two and one half, the other three, times the average dose

Admitting the occasional occurrence of a patient who proves unusually tolerant to digitalis through one or another unknown cause, there remains the much more important occurrence of specimens of digitalis which are for some inherent reason poorly absorbed, irrespective of the patient Thus, Dr B S Oppenheimer [5] records three patients who consumed enormous amounts of a given sample of digitalis without evidences of either therapeutic or toxic action One of his patients took 540 minims of the tincture and 21 ounces of the infusion (same digitalis) in twenty-three days, equivalent to 134 c c of the tincture A second took 3,090 minims (193 c c) of the tincture in thirty-eight days, and the third took 3,735 minims (233 c c) of the tincture (or its equivalent in infusion) in forty-three days These amounts are from five to nine times the maximum average dose required for a sample that is absorbed as well as the average Even when allowances are made for the long periods over which administration was continued, it is evident that the particular lot of digitalis employed was very poorly absorbed Similar observations are reported by Wedd,[6] who records five patients who took of a given sample from four to six times the average total dose with no toxic symptoms, and with little or no therapeutic effect Other instances have come to our attention but we have insufficient data to warrant their inclusion, nor would anything be added by rehearsing them, since the foregoing are sufficient to indicate how poorly some samples of digitalis are absorbed

The observations reported by Hatcher, in which he shows that digitalis can readily be separated into two distinct fractions by extraction of its aqueous solution with chloroform, and his observations on the marked differences in the absorbability of the two fractions from the alimentary canal of the cat opened the way for the clinical study of the absorption of digitalis from a new angle This study though begun some months ago has not progressed as rapidly as was hoped, partly owing to the crippling of our service by the influenza epidemic I regret, therefore, that I can at present make only a preliminary report, which, however, shows results in close harmony with those obtained by my colleague Dr Hatcher on animals

In order first to compare the absorption of each of the two fractions with the results previously obtained with various samples of tincture of digitalis made from high grade leaves the fractions were supplied to me in the form of artificial tinctures in a menstruum of 60 per cent alcohol All the samples were prepared so that 1 c c represented one cat unit in activity These were administered to patients and the

whole procedure was made to parallel as closely as possible the original plan followed in the determination of the average total human dose of the tinctures In this way the results could be compared directly with those secured from the use of the official tinctures

Twenty-three complete courses of administration were carried out in twenty-one patients, using four different samples of the chloroform-soluble, and one of the chloroform-insoluble, fractions Each of the chloroform-soluble fractions, 8-3-19, 9-23-19 and 2-3-20, was obtained from a different lot of digitalis leaves, while the fraction 3-18-20 was made by mixing the chloroform-soluble extracts obtained from a large number of different samples of digitalis The chloroform-insoluble fraction 9-23-19 was obtained from the same leaf as the chloroform-soluble fraction of the same number

The determination of the average total therapeutic dose of each of the chloroform-soluble extracts was the first problem attacked, since its solution would provide the necessary data for the investigation of other problems The full therapeutic dose of one sample of the chloroform-insoluble fraction was also determined approximately The results of this phase of the investigation are set forth in the accompanying table, in which the corresponding figures for the tincture of digitalis (seven different specimens) and for crystalline digitoxin are included for comparison

AVERAGE FULL THERAPEUTIC DOSES AND PERCENTAGE VARIATIONS FROM THE AVERAGES FOR EACH FRACTION FOR ALL CHLOROFORM SOLUBLE FRACTIONS COMBINED FOR TINCTURES OF DIGITALIS AND FOR CRYSTALLINE DIGITOXIN

Preparation	Full Therapeutic Dose Average	Number of Cases	Per Cent Above	Per Cent Below
Chloroform soluble fractions				
8-3-19	0 153	3	11	20
9-23-19	0 161	6	26	28
2-3-20	0 157	5	20	18
3-18-20	0 182	1		
All chloroform soluble fractions	0 159	15	28	26
Chloroform insoluble fractions				
9-23-19	0 640	4	19	30
Tinctures	0 148	25	97	66
Digitoxin*	0 066	15	66	43

* One very tolerant patient is included in this group If omitted the average for the fourteen remaining cases is 0 063 with maximum variations of 36 per cent above and 40 per cent below

Reference to the table shows that the average full therapeutic dose of each of the first three chloroform-soluble extracts studied is approximately the same The average total dose, calculated from fifteen instances in which one or the other of the four different samples of extract was used, is but slightly higher than the corresponding average for tinctures, as determined from twenty-five cases The activity of the chloroform-soluble fraction for man, therefore, is not materially different from that of the average high grade tincture of digitalis, when the comparison is made on the basis of the biologic activity of each as determined by the cat method of assay

The chloroform-soluble extract contains an average of about 1 mg of solid per cat unit, while the amount of solid per cat unit of the official tincture of digitalis varies widely—between 28 and 44 mg in three samples tested These figures give some idea of the degree of purification of the extract This is further shown by the fact that commercial crystalline digitoxin has an activity of from 0 35 to 0 4 mg per cat unit, or only about three times that of the chloroform-soluble extract Dr Hatcher has shown that the extract gives the typical color reaction for digitoxin, and that it presents many close resemblances to digitoxin pharmacologically In spite of these close similarities, he has shown that the chloroform-soluble extract of digitalis is not the same as crystalline digitoxin, but that it is probably a somewhat altered combination of digitoxin It is of interest in this connection, therefore, to compare its behavior in man with that of crystalline digitoxin The table shows that for man the activity of digitoxin is about two and one-half times that of the purified extract, when the comparison is made in terms of the biologic activity of each as determined by the cat method When, however, the activity for man is compared in terms of weight, it is found that crystalline digitoxin is about seven times as active as the purified extract These comparisons make it certain that the chloroform-soluble extract is not the same substance as crystalline digitoxin, and confirm the results of the laboratory investigations previously cited

Turning now to the question of the absorption of the chloroform-soluble extract, it is seen from the table that the range of variation of dose from the average is much smaller for each of the three fractions investigated, and for all combined, than it is for representative good tinctures of digitalis Thus, for the chloroform-soluble fraction the greatest divergence from the average dose amounts to only 28 per cent of the average, that is, one patient of the fifteen developed full therapeutic effects only after he had received 28 per cent more than the average dose required This contrasts strikingly with the variation noted among a variety of tinctures obtained from different sources, which rises to 97 per cent above, and falls to 66 per cent below the average Further, while no variation greater than 28 per cent of the average dose occurred in a series of fifteen patients receiving the chloroform-soluble fractions six patients receiving the various tinctures of digitalis showed variations greater than 40 per cent of the average dose, in a series of twenty-five

These facts show that the chloroform-soluble extract of digitalis is absorbed from the human alimentary tract much more uniformly than are high grade tinctures of digitalis obtained from different sources, and it should be recalled that some samples of the official tincture obtained from reliable sources are so poorly absorbed that amounts from four to nine times the average full therapeutic dose fail to produce any demonstrable effects or at most produce only slight and insufficient effects The fact that the chloroform-soluble extract is absorbed from the human digestive tract with much greater uniformity than is the tincture of digitalis is alone sufficient to render it a valuable advance in the pharmacy of digitalis, even if it should prove to have no other advantages over the cruder preparations Although at present no definite statements can be made on the basis of clinical investigation, it seems probable that the chloroform-soluble extract will prove to have other advantages, especially on account of its relative freedom from impurities and its ready miscibility with water, so that it should be available for intravenous injection [8]

Before leaving the subject of the irregularity of the absorbability of commercial tinctures of digitalis which are derived from different sources, I want to call attention to the fact that the biologic activity of the

8 The chloroform soluble extract has since been administered intravenously to one patient with satisfactory results and without untoward effects

tincture is not necessarily related to its absorbability from the human alimentary tract This is well illustrated by the fact that the tinctures which Oppenheimer and Wedd found to be so poorly absorbed were both of approximately average biologic activity, and both were considerably more active than some of the tinctures which I found to be absorbed fairly well and relatively uniformly It seems certain that this fact will necessitate a radical change in the method of assay of digitalis for human use, and Dr Hatcher is now approaching the problem of determining both the activity and the absorbability of digitalis as a means of reaching a more accurate estimate of its therapeutic value

The precise rate of absorption of the chloroform-soluble extract has not yet been determined for man, but the evidence so far obtained indicates that it is absorbed at least as rapidly as the most readily absorbed tinctures, and I can cite one case which was examined at least every hour and in which the maximal therapeutic action had developed within two hours and a half after a single dose amounting to about 0 112 cat unit per pound (15 c c total) The persistence of action of this extract has also not yet been determined for man, but again the evidence so far obtained indicates that it is equal to the best digitalis in this respect

The chloroform-soluble extract has been supplied to several others for the study of its behavior in man, and we have reports from two who have used it in several cases Dr B S Oppenheimer of New York states that "the purified tincture of digitalis has proved uniformly satisfactory" Dr R W Scott of Cleveland has administered it in eight carefully controlled cases and reports that "(1) digitalis action occurred in from one to two hours after 10 c c [single dose] was given by mouth The certainty with which one could predict a definite improvement in the circulation in from eight to ten hours was indeed striking (3) Thus far the therapeutic effects have been fairly uniform as indicated by the level to which the heart beat was slowed, with resulting circulatory improvement"

I want to mention the results of the administration of the chloroform-insoluble extract to five patients, two of whom also received the chloroform-soluble extract from the same leaf on another occasion The average full therapeutic dose of the chloroform-insoluble fraction is about four times that of the chloroform-soluble, in terms of biologic activity, indicating that in man as well as in the cat it is absorbed very poorly following oral administration Other studies on its behavior in man have not been made as yet, owing to the obvious lack of value of the preparation

SUMMARY

1 The fairly rapid and complete absorption of digitalis from the human alimentary canal is shown for a number of different high grade tinctures of digitalis

2 Contrasted with this is the very poor absorption of certain tinctures, of which from four to nine times the average therapeutic dose failed to produce therapeutic effects

3 The marked uniformity of absorption of the chloroform-soluble extract of digitalis prepared from a variety of different leaves is shown and contrasts sharply with the variations noted in the cases of tinctures from a variety of sources

4 The chloroform-soluble extract is shown to be absorbed at least as rapidly as the best tincture of digitalis, and its persistence of action is apparently of the same order as that of digitalis of the best grade

5 The observations indicate that for oral administration the chloroform-soluble extract is not superior to a well absorbed tincture of digitalis, but it is far superior to tinctures which are derived from a variety of sources, the absorption of which shows very marked variations when the individual specimens are compared

6 The chloroform-insoluble extract is very poorly absorbed from the human alimentary tract, as well as from that of the cat

412 West End Avenue

ABSTRACT OF DISCUSSION

DR HENRY A CHRISTIAN Boston Digitalis is a very good drug Its use can be improved by investigation We are getting better products to use in our practice, and consequently this sort of work is of very great importance Although digitalis is not a perfect drug it is not fair to blame the drug too often for getting poor results Even a perfect drug will not give results unless it is used with brains Digitalis is more often misused than almost any other drug You can take almost any preparation of digitalis use it with intelligence and you can get results in almost any condition The average doctor does not get the best results because he does not use the drug with intelligence There is a lack of knowledge as to how to use the drug and there is a lack of observation as to whether the drug is producing the result it should produce It is the failure to know whether we are getting the desired results and to guide ourselves by that observation as to whether or not to increase the dosage which largely is responsible for not getting desired results from digitalis With these better preparations of digitalis and better methods of using them poor results are going to be greatly reduced in number but remember they are not going to disappear because no one can supply you with the intelligence that you may lack, or having it fail to use

DR LEONARD G ROWNTREE, Minneapolis Within the last six or seven years we have obtained digitalis effects that we never saw before I remember quite well when we first used Hatcher's method of standardization in Baltimore. We visited the hospital pharmacy secured various preparations of digitalis leaves and assayed them by Hatcher's cat method There was a variation in potency of 400 per cent in the digitalis leaves which we found there This emphasizes the absolute necessity of using standardized preparations of digitalis in our clinical work

I had a striking experience in relation to the introduction of standardized digitalis into clinical work One day my intern called my attention to some digitalis effects The charts showed a remarkable drop in the pulse rate On investigation it developed that it was the new standardized preparation of digitalis and these were the first cases in which it had been used We can get infinitely better results therapeutically if in all instances we insist on having digitalis that has been standardized The second great development in digitalis therapy came with the dosage introduced by Dr Eggleston Results with standardized preparations but with ordinary doses come at the end of forty eight hours With Dr Eggleston's method the same results can be obtained in from eight to twelve hours This is a tremendous advance since many patients die because of the time required to elicit the effects of the drug Dr Eggleston's dosage unquestionably has saved a very large number of cardiac cases The marked variation in absorbability is a matter of surprise to me This may be due to the fact that we have been using exclusively the Minnesota preparation and in a large proportion of cases the Eggleston dosage In our work in Minneapolis we have never experienced difficulty from lack of absorption

DR CARL EGGLESTON New York If one can always obtain a good preparation of digitalis there is no need for the refinements introduced in this chloroform soluble extract Dr Rowntree is extremely fortunate in being able to work with a preparation of digitalis which is grown and cared for with the greatest of attention from the beginning until

comes into his hands as a finished product, so that he has a preparation which is of fairly uniform activity and uniformly well absorbed The preparations generally used come from every conceivable source and are made with every conceivable degree of care and lack of care So the products, while standardized, may or may not be readily absorbed We have had several specimens submitted that were irregular in absorption and very poorly absorbed The more we see of these the more we think there is something to be gained by the effort to reduce this irregularity in absorption, which we try to avoid by the use of the chloroform-soluble preparations described

OBJECTIVE SYMPTOMATOLOGY OF FOOT STRAIN *

ALBERT H FREIBERG, M D
CINCINNATI

Since it is now generally acknowledged that we are unable to tell, from the appearance of a foot, to what extent it is or may be the cause of suffering and consequent disability, it seems desirable to have as definite knowledge as possible of such symptoms as may be brought out by careful objective examination We know that a foot may perform its functions, for a long time at least, painlessly and without undue fatigue in the presence of evidently abnormal relations between the foot and the leg, or between the relations of the bones of the foot toward one another It is nevertheless to be assumed that individuals with such abnormal conditions bear in them the potential factors of disability, which require only the added element of unusual functional demands, trauma, or infection to call forth a situation which will bring them to us for aid When this time comes it is often the case that the symptoms are localized at a distance from the foot which, after correct analysis, must be recognized as the fundamental seat of trouble Failure to recognize this means failure to apply the remedy which will be effective

The functional interdependence of the large joints of the lower extremity is generally acknowledged, it is easy for one who has studied the mechanics of the joints to understand how continued use of feet which are visibly out of adjustment may in time react injuriously on the mechanism of the knees and call forth symptoms in them without doing so in the foot itself The situation is more or less akin to that of the patient who suffers from headaches produced by defects of ocular refraction, without knowing or having known that there was anything wrong with his eyes But there are many who suffer from the same character of symptoms who have no organic defect in the eyeball itself, but in whom the symptoms must be ascribed to muscular insufficiencies which in their turn make it necessary for the organ to do its work at great disadvantage, this it is able to do for greater or less periods until the limit of functional margin is reached That the approach to this limit is hastened by factors of different kinds is well known, even in the eye these may be said to consist of the same three groups before mentioned, although not in the same order of frequency, thus unusual functional demand, infection and trauma

What is not generally appreciated with regard to the foot is that a very large number of persons, by reason of their footgear, have insensibly reduced their muscular working limit or "margin of safety" to such an extent that they enter the phase where the strain of further function makes itself felt either in loco or at a distance, without a cause which is to them perceptible Since it has not been understood by medical men until quite recently, and since it is even now not commonly borne in mind, it is not strange that it should be difficult to explain this pathologic physiology to patients of even unusual mental grasp We require, in fact, to sweep first before our own door The difficulty is one of functional analysis We have means of determining the absolute and relative strength of functional response in the leg and foot muscles, have we a means of determining by *objective* examination the result of impairment of that strength in the absence of subjective symptoms on the part of the foot? However important deformity may be when it is present, we must acknowledge that it is not to be regarded as the gage, that the patient's power of "accommodation" may be entirely sufficient to neutralize this

In the days when the physical abnormity of the foot was the clinical index, local tenderness was of second importance only in the examination It failed of reliability in the same measure as the element of deformity In older writings on the subject of flatfoot, we usually find allusion to tenderness at the scaphoid tubercle, later in the literature we find discussion of the variability of this symptom, just as we do with regard to the flatness of the foot In other words, when the individual who has marked pronation-abduction at the astragaloscaphoid joint is suffering, he is very likely to be tender at the scaphoid tubercle by reason of the abduction A large proportion of cases with evident deformity have however, but little or none of it in the sense of abduction of the forefoot, it is not surprising, then, that under such circumstances there should be a failure to find tenderness at the scaphoid tubercle

In considering the nature of foot strain and its remoter symptoms, we are generally agreed that impairment of muscular control is the element of fundamental importance, that deformity need not be at all apparent and that in a quantitative sense it is not even a reliable guide to the severity of symptoms, nor yet as to the difficulty which we shall experience in trying to relieve them We recognize the fact commonly, on the contrary, that if the ligamentous apparatus is congenitally relaxed, or if it becomes so by reason of such disease as rickets or by the very gradual loss of muscle control, and if under any of these conditions there arises no excess of functional demand, great degrees of physical deformity may be present or may develop in the complete absence of subjective symptoms or disability in an ordinary sense We agree that the foot pains which bring patients to us seeking relief are to be looked on as reactions on the part of the very sensitive periosteal attachments of the ligaments on which abnormal stresses are permitted to fall because of muscular insufficiency, we realize also that with visible mechanical maladjustments at the lower end of the leg, coarse disturbances of the lines of weight bearing and muscular balance may produce difficulties in function for the knee, hip and even the spinal joints What we do not usually appreciate is that many individuals with feet muscularly impaired are succeeding in maintaining a quite correct general posture notwithstanding, but that this cannot be done without improper expenditures of muscle power else-

* Read before the Section on Orthopedic Surgery at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

where This is in the same manner as the individual with ocular defect, who manages nevertheless to use his eye with an abnormally great expenditure on the part of his accommodation There is this, however, to be emphasized, the individual who experiences the effect of such eyestrain is the one who, by reason of inherent energy or great pressure from without, does succeed in obtaining intensive, efficient and long continued function from his handicapped organ In the absence of such intensive use, the reaction at a distance is scarcely to be expected In an analogous way, it might be expected that the individual who is going to suffer from muscular strains at a distance from the foot is not the one with general postural "slump", on the contrary, it is likely to be the one who succeeds in maintaining an attitude more or less correct, and we are for this reason likely to find it in individuals to whom pride of personal appearance is an important consideration

In the absence of physical abnormality and of subjective symptoms in the foot itself, how shall we then be able to determine that the foot must be looked to as the source from which other functional strains proceed? Surely not by simply satisfying ourselves by muscle tests that weakness exists, such values are of a character too relative, it would perhaps be better to say that they are too unrelated to the individual himself It would be better to search for a reaction in the patient that might be looked on as the unconscious but necessary result of his diminished muscular capacity

A thoughtful examination of the anatomy of the foot with respect to the purpose of its structure may well be looked to in order to form a conception of the true meaning of some of the abnormal manifestations there to be observed That the foot is not meant to be a merely passive support for the body, a pedestal *on* which to stand and walk, but rather a living organ *with* which to stand and walk, has become a truism, but one which is constantly being forgotten Too much has been thought and said about the arches of the foot, too much, in other words, about its intrinsic structure and too little about its mechanical relationship to the rest of the lower extremity After all, it is by a study of this relationship, perhaps, that we shall be able to learn more about the remote results of functional disturbance in the foot, having done this we shall be better able to examine the abnormal foot with an eye to the finer details of its abnormality

Viewed in this way, the most striking feature about the mechanism of the foot, when regarded as a whole and with respect to its functional relationship to the leg, is the fact that its construction is such that a means must be provided to keep it in line with the rest of the lower extremity, during weight bearing The transmission of the body weight to the ground takes place through a line corresponding to the axis of the tibia, passing through the center of the tibio-astragaloid joint approximately, but which passes through the os calcis not at its center but decidedly mesial or internal to this point This may be seen in any anatomic drawing of the ligamentous preparation of the foot, viewed from behind The resulting tendency of the foot as a whole to cant inward on the leg unless prevented by muscular action is emphasized in every description of the foot mechanism

While the eccentric position of the astragalus on the os calcis is to be regarded as the chief reason for the tendency which exists for the foot to move into pronation, unless prevented from so doing by muscular action, it should not be overlooked that there is another mechanical factor of importance in this connection This has been emphasized by Roberts[1] who calls attention to the "globular contour of the inferior bearing surface of the os calcis" He says further "If the under surface of the bone was flat instead of round, many valgus deformities would never occur" While it is perhaps not justifiable to make this statement in quite so final a manner, there can be little doubt of the importance of this mechanical factor when combined with the eccentric position of the os calcis with reference to the center of gravity of the leg On the other hand, it seems quite right to say that the obvious purpose of this condition of mechanical instability is to provide for elasticity of gait through the muscular control

If we examine the illustrations of the ligamentous preparations of the foot as found in Hicks's work or as found in Spalteholz's and Toldt's atlases we shall find that the ligamentous checks to motion in pronation and abduction lie in the internal lateral ligament of the ankle, chiefly This ligament otherwise spoken of as the deltoid ligament, is a composite structure made up of several bands The band of greatest interest in this connection is that one which, attached above to the tip of the internal malleolus has an almost vertical course downward being inserted below to the innermost border of the sustentaculum tali This band is called the tibiocalcaneal ligament It may easily be seen that when any movement in pronation is not sufficiently controlled by muscular action stress will first of all fall on the tibiocalcaneal ligament, if we imagine the os calcis being allowed to cant inward, as it will tend to do under these circumstances this ligament will be the seat of a cross-breaking strain where it is attached to the inner border of the sustentaculum Since pronation and abduction of the foot are practically always associated, the tendency is for the head of the astragalus to rotate outward on the os calcis, this implies a movement inward of the posterior part of the astragalus The ligamentous check to this movement is found in a short band which is attached to the posterior process of the astragalus behind, and which passes almost horizontally forward to the posterior end of the sustentaculum In the case of latent weakness of the muscles controlling supination and adduction, even though no deformity in the opposite direction be apparent, we shall be able to comprehend that abnormal stresses are continually falling on these two ligamentous bands and that their periosteal attachments are under these circumstances likely to be tender to pressure, for this reason

It has always seemed to me that if our explanation of the cause of pain in foot strain is correct, that if it is to be ascribed to ligamentous strain because of insufficient muscular control and if the pain must be regarded as proceeding from the periosteal attachments of the ligaments as their only sensitive parts then it is to be expected that their attachments should be found tender as a rule in such cases It has, however been observed that the tenderness at the scaphoid tubercle is very often absent, in my experience it is more often absent than present in cases of undoubted foot strain in which marked deformity in abduction is not a feature This might be explained by assuming that the seat of strain must for this reason be situated

1 Roberts, P W Am J Orth Surg 11 [illegible]

elsewhere This having been assumed, the study of the ligamentous preparation of the foot resulted in the conclusions just before mentioned It remained now to investigate the conditions, clinically

For several years I have made it an invariable practice, in examining the foot for functional strain, to test the sustentaculum for tenderness I did this for a long time before mentioning it to my associates I was surprised to find that practically all persons who had undoubted foot strain were tender at this place, whether deformity of the foot was present or not The degree of tenderness varied considerably, so far as I was able to tell by the patient's response, it was not always severe in proportion to the sensitiveness of the foot or the amount of the patient's suffering For the last two years, I have taken every opportunity to test the tenderness of the sustentaculum in persons who were free from the symptoms, at least, of foot strain I was interested to note that a large number of these also presented this tenderness Many others, particularly men who wore sensible shoes, did not It seemed, furthermore, that the tenderness in these symptomless feet was less marked and more difficult to demonstrate than in those who presented themselves because of foot discomfort

With the idea of trying to explain the significance of these observations, it appeared worth while to attempt to find a way to measure the degree of tenderness which could be called forth It seemed feasible to do this by measuring the amount of pressure required to produce the first appreciable sensation of tenderness on the part of the patient Even though this involves the personal equation, both of patient and examiner to some extent, it has resulted in findings of quite uniform character, which to me, at least, seem of some value Having suggested the plan of estimating the degree of tenderness to my associates in the hospital, Dr D R Maddox and I both produced simple appliances, of different construction, for registering the amount of pressure made over a point corresponding in size with the tip of the finger It has been used in the following manner After the point of greatest tenderness has been found with the finger, the spot on the skin corresponding is fixed carefully by the eye, the rubber end of the instrument is now carefully placed on this point, and while pressure is very gradually increased, the patient is instructed to say when the first sensation of tenderness is felt The amount of pressure is then read on the scale of the instrument While great accuracy cannot be claimed for this method, it is nevertheless surprising to see how constant the readings have been in the same patient, I have made many tests to ascertain this

Although I have not tabulated them with enough care and in sufficiently large number to justify the presentation of definite conclusions, I have made so many tests on patients that I have thus summarized my own experience

1 Persons who have symptoms which may be attributed to weakness of supination and adduction of the foot practically always have tenderness of the insertion of the tibiocalcaneal ligament into the sustentaculum tali, or at its posterior extremity

2 In such persons the tenderness is usually called forth by a pressure of less than 2½ pounds Most often the reading will be from ½ pound to 1½ pounds

3 Many persons who have no foot symptoms have tenderness on pressure over this point, this is also true of many persons who have no symptoms attributable to the lower extremities at all In this group of persons, pressure of 2½ pounds or more is usually required to call forth tenderness

4 Most persons with strong, symptomless lower extremities are not tender on pressure over the sustentaculum This tenderness is to be regarded as indicative of potential weakness in adduction and supination This is true in proportion to the ease with which tenderness is called forth

5 Further and more extensive experience with this test is necessary before ascribing to it a definite place as a diagnostic measure

The functional interdependence of the individual segments of the lower extremity has been referred to in the first part of this paper This has long been recognized in an indefinite manner as the result of clinical experience Patients with foot strain have told us time and again how they suffered from fatigue and pain in the legs, thighs and back, and we have been able in such cases to dispose of these symptoms by attention to the malposture of the feet Lowman[2] has shown the importance of the external rotators of the thigh in maintaining the proper relations of the leg to the foot, he has set forth the possibility of assisting the restoration of normal muscular balance by gymnastic cultivation of this group of muscles It has been my experience to find his statements corroborated in practice In fact, I am now disposed to regard the exercises for the external thigh rotators as by all means the most important at my disposal

To say at this time that exercises for the restoration of muscular control should constitute an indispensable part of any treatment for foot incompetence may be considered superfluous or perhaps not even germane to the phases of this subject chosen for discussion I feel, however, that no opportunity should be overlooked to emphasize this important factor in treatment Even now it is being often slighted by those in whom it is scarcely to be considered pardonable

ABSTRACT OF DISCUSSION

DR JOHN L PORTER Chicago The astragalus is internal to the line of force in the foot That is why a man standing with his feet widely separated more frequently suffers from foot strain than does the man who actually walks flatfooted In examining for foot strain many of us have failed to find anatomic evidences of disturbance, but by carefully palpating the foot, we have been able to elicit a tender spot over the sustentaculum tali, that is, it is farther back than in the average case Most patients complain of pain at the astragaloscaphoid articulation, but often they complain of pain on the outer side of the foot By palpating carefully you will find the point of tenderness mentioned by Dr Freiberg

DR PAUL B MAGNUSON, Chicago Do you apply pressure quickly or slowly? This is a point of great interest when trying to detect malingerers

DR ALBERT H FREIBERG, Cincinnati Having located the tender spot with my finger as exactly as I can, I place the rubber tip on it and tell the patient to close his eyes, then very gradually I increase the pressure, telling him when he feels the very first sensation of pain to say 'now" I do it just as slowly as I can—that is very important so as to give him opportunity to say when it begins to hurt If you do it quickly, the value of the test is nil as far as detecting malingering is concerned The striking feature about this test is the accuracy with which the patient will say "now' when the same amount of pressure is registered The method has diagnostic value

INTRACRANIAL LESIONS INVOLVING THE AUDITORY-VESTIBULAR APPARATUS*

E R CARPENTER, M D
DALLAS, TEXAS

The development of the vestibular tests along with other methods of differential diagnosis in intracranial work has materially extended the field of otology and has increased greatly the usefulness of this specialty, but these things are not so well known as they should be among physicians in general

The extensive course of the eighth nerve fibers through the central nervous system and the synapses of the vestibular nerve endings with almost every motor nerve in the body are of so great importance that more information about the brain can be obtained from the otologic examination, when made by experienced men, than from any other neurologic test

The source of the disturbance in otologic trouble should always be located, whether it be in the eustachian tube, the middle ear, the labyrinth, or whether it be of intracranial origin The manifestation of trouble may be loss of hearing, noises or pain in the head, dizziness, nausea and vomiting, voluntary nystagmus, or any combination of these symptoms Detailed analysis of the various tests employed in differential diagnosis of auditory vestibular disease cannot be considered in this article, but a brief summary of the important practical points utilized in the examination of neurotologic cases is advisable

IMPORTANT PRACTICAL POINTS

1 The hearing tests, when carefully made, are of great value in differentiating between middle ear disease and nerve disease from any source, but they are of no practical value in the localization of the nerve lesion, except when they are considered in connection with other findings that may or may not be directly in relation with the auditory vestibular apparatus

2 The vestibular tests give more information than the auditory tests in the localization of lesions involving the cerebellar fossa and the brain stem, and when considered in connection with the auditory tests they are of great value, although these tests should never be depended on to the exclusion of other methods in arriving at a diagnosis

3 An accurate history is absolutely indispensable in this work The exact period at which auditory disturbances came on in relation to other points in the history may be the only means of differentiating a tumor of the auditory nerve from an angle tumor from some other source Likewise attacks of vertigo and digestive disturbances following an infective process in any place in the body may reveal the origin of a cerebellar abscess that becomes evident as such several years later

4 Since lesions of the brain stem and cerebral cortex frequently involve the auditory vestibular apparatus, it is necessary in all case carefully to examine the motor and sensory systems, as they may be implicated directly or indirectly, while the various deep and superficial reflexes, along with the cerebellar tests, are also important points to be considered Usually serologic, urinary and spinal fluid analyses are required and at times chemical examination of the stomach contents and roentgen-ray investigation of the digestive tract are useful in clearing up mooted questions when vertigo, nausea and vomiting are concerned

5 The function of all cranial nerves should be tested in most cases, but, owing to the anatomic relation of the fifth and seventh nerves to the eighth nerve in the posterior fossa, they are more likely to reveal some disturbance than other nerves The seventh or facial nerve, which is in direct contact with the eighth nerve in the posterior fossa, is supposed to be more frequently implicated than other nerves in auditory vestibular disease, but clinical evidence does not bear out this claim In a series of thirty neurologic cases all revealing some form of auditory vestibular disturbance, I found that only 10 per cent revealed seventh nerve trouble, whereas over 80 per cent revealed fifth nerve disturbance of some nature, including subnormal corneal reaction anesthesia, hyperesthesia or analgesia of the face loss of taste, neuralgia, burning sensation in the mouth and nose, and other forms of paresthesia

INTRACRANIAL LESIONS

Intracranial lesions involving the auditory-vestibular apparatus may be considered to advantage under three heads (1) lesions primarily involving the cerebellar fossa, (2) lesions primarily involving the brain stem and midbrain and (3) lesions primarily involving the cerebral cortex and subcortex region

1 Lesions in the region of the cerebellum are of special importance to the otologist as they include many conditions that are amenable to improvement or cure if they are diagnosed early and properly treated The lesions most likely to be encountered here are acute inflammatory diseases involving the meninges, acute and chronic abscesses, tumors of the meninges and of the nerve trunks syphilis in its various forms traumatism circulatory diseases, tuberculosis and multiple sclerosis

Eighty per cent of the abscesses in the posterior fossa originate from infected ears, consequently, the diagnosis and treatment of this condition falls primarily to the otologist, who must be familiar with the differential diagnosis of lesions in this region and with the various operative procedures required for relief In all major otologic operations, repeated vestibular tests should be made as they often indicate impending intracranial trouble long before clinical symptoms develop

Cushing[1] states that 6 per cent of all brain tumors and over 20 per cent of all posterior fossa tumors originate from the eighth nerve, and that the syndrome for the auditory nerve tumor is unmistakable for that of other tumors of this region yet in thirty-five referred cases reported by him a definite diagnosis had not been made in most cases before very serious damage had occurred such as blindness paralysis or respiratory complications The eighth nerve syndrome consisting of primary deafness followed by fifth or seventh nerve trouble on the same side and later by other angle symptoms, is of great importance to the otologist, as relief from the disturbance, or the life of the patient depends materially on how early operative procedures are advised

* Read before the Section on Laryngology Otology and Rhinology at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Cushing Harvey Tumors of the Nervus Acusticus and the Syndrome of the Cerebellopontile Angle Philadelphia W B Saunders Company 1917

At least 50 per cent of all cases of brain syphilis present some impairment of the auditory-vestibular apparatus, and in many cases bilateral lowering of the high tones and raising of the lower tones, with subnormal vestibular reaction, are the earliest indications of approaching trouble Neuritis of the eighth nerve, syphilitic meningitis and gummas are the forms of syphilis most often encountered in the cerebellar region

Traumatism, tuberculosis, circulatory diseases and multiple sclerosis form a group of lesions that occasionally implicate the auditory-vestibular apparatus in the posterior fossa The treatment of these conditions is far less satisfactory than in the previously enumerated diseases, but these conditions are not hopeless, by careful observation some of them can be materially relieved or improved

2 Any of the diseases already considered may also involve the auditory-vestibular apparatus in the brain stem, but the symptomatology in brain stem lesions varies considerably from that encountered in the cerebellar region Certain additional diseases peculiar to the nervous system are encountered in the medulla, pons and midbrain region, such as tabes, syringomyelia and poliencephalitis However, the preponderance of brain stem lesions are included under syphilis, tuberculosis, circulatory trouble and toxemia

3 Cortical and subcortical disturbances of the auditory-vestibular apparatus have not been investigated thoroughly However, the tracts of the auditory fibers are well known and the auditory centers are known to be located in the first temporal convolution on each side of the cerebrum, and lesions in that region may produce disturbance in hearing, especially if bilaterally located No doubt somes cases of deafness originate from this source which are presumed to be of labyrinth origin, as microscopic study of the pyramidal cells in the first temporal convolution reveals intercellular changes similar to those found in the motor and sensory pyramidal cells, in certain diseases Possibly in exceptional cases the auditory disturbance in tabes, poliencephalitis, paresis, toxemia, and especially in some of the infectious diseases, are from this source

The subcortical association tracts in connection with the auditory centers are fairly well understood The different forms of aphasia from tumors, abscesses, hemorrhages, etc, involving these tracts frequently reveal important information in cerebral localization Conjugate deviation of the eyes, which is often encountered in the vestibular tests, may arise from lesions situated in the cerebral cortex or deeper structures

SYMPTOMS FROM TRANSMITTED PRESSURE

According to the best authorities, equilibrium is a muscular act innervated by the cerebral cortex and governed largely by the coordinating influence of the cerebellum, which receives impulses from the labyrinth, from the skin, muscles and joints, and from muscles of the head and eyes Vertigo is a symptom of disturbance of equilibrium, and in all cases in which the vertigo is of a rotational character the disturbance involves the vestibular apparatus directly or indirectly

The relation of rhythmic nystagmus to disturbance of the vestibular apparatus is very well understood Bechterew, Cajal and other investigators long ago described the anatomic connections between Deiters' nucleus, Bechterew's nucleus, and the posterior longitudinal bundle Clinical observations have verified these assertions and we now know that nystagmus from central origin may be independent of vertigo, and vice versa

Aside from intracranial lesions that directly involve the auditory-vestibular apparatus, tumors in the supratentorial region, or frontal lobe tumors, may produce symptoms from transmitted pressure that are quite similar to those observed in direct lesions, here, the vestibular tests are frequently very valuable in the differential diagnosis between cerebellar and cerebral lesions

GRADUATE OTOLOGIC WORK

The localization of intracranial lesions involving the auditory-vestibular apparatus requires more knowledge of the nervous system than is usually taught in postgraduate work on otology As this specialty has so much in common with intracranial work, possibly, selected courses on brain anatomy, neurology, and special operative work, in addition to the regular clinical courses, would be an improvement over the present system of teaching neurotology in our schools, and would do much to further develop this subject

---

ABSTRACT OF DISCUSSION

DR ISAAC H JONES, Los Angeles The most fundamental error which might arise in regard to neuro-otologic work is that in attempting to present a picture of the intracranial pathways, it has never been done with the thought that all of these pathways are definitely established Miller and Weisenberg many years ago presented a *schema* or outline of cerebral localization, making it very clear that it did not mean that there was *no other work to be done on* this subject, but that it was felt advisable in such an utterly new subject to take first of all the pathways that we know definitely and bring out a tentative schema which was most reasonable according to the data already at hand The same thing is true now, and it surely must be clear that it is but a scaffolding on which to erect ultimately the *more definite* and exact course of the fibers of this enormous mechanism Dr Carpenter has given a very excellent classification of the three types of intracranial lesions in which the tests may be of service

DR HAROLD I LILLIE, Rochester, Minn I do not believe we have sufficient data from the ear examination to warrant us in designating the type of pathology with which we are dealing in the cranium Be that as it may, there are certain conditions, for instance in multiple sclerosis, in which the neurologists dislike very much to make a diagnosis of multiple sclerosis without finding some evidence of lesion within the brain stem In neuro-otologic work we are frequently able to assist in the diagnosis of multiple sclerosis by finding and isolating the lesion affecting one of the tracts in the stem This has been done repeatedly in our clinic Meningitis and brain pressure particularly are difficult to differentiate in certain types of cases New intracranial pressure and old intracranial pressure cause different objective phenomena A recent increase of pressure is very liable to give an exaggeration of the response, an old pressure may give an obliteration of the response, which makes interpretation of reports difficult and sometimes impossible A supratentorial lesion may give neurologic symptoms and indications of cerebellar tumor because of the pressure produced We had one such case where because we were able to get our response through the cerebellum we said the cerebellum was free A cerebellar decompression was done The patient came to necropsy and the lesion was found in the supratentorial anterior fossa Since that time the surgeons have given a little more consideration to our suggestions The interpretation of objective findings is difficult and requires intensive study but I feel certain that if it is done in large clinics where there is ample material for this work, we eventually will arrive at some definite and valuable information

DR. TOM A WILLIAMS Washington D C The credit in this country for the study of the intracranial lesions which show themselves in morbid vestibular reaction is mainly due to Dr Jones, and his collaborator, Dr Fisher Their cooperation with Dr Mills, a neurologist, achieved one result at least which is most fruitful, namely the differentiation of the tract which carries the impulse from the horizontal canal as against the tract which carries the impulse from the vertical canals While it is most gratifying to find so many otologists now turning their attention to the neurologic aspect of otology, namely, the lesions which occur beyond the vestibular nerve, more particularly within the cranium yet we neurologists all find that the interpretation of lesions of the brain stem is one of the most difficult tasks of clinical neurology, even for those of us who have devoted our lives to perfecting ourselves in a knowledge of the anatomy, physiology and clinical study of the brain stem There are so many fasciculi and they are so complicated, and some which are not known, that it is very difficult to form judgment, more particularly when we remember that the same symptom complex may occur whether the lesion causing the disorder is within the brain stem itself or is only pressing on the brain stem I appeal for closer collaboration with the neurologist in these cases The assertion has been made that a growth at a distance is more apt to cause excessive function That is only true, perhaps, of the excessive function of the brain tissue itself It is not true of the most frequent of all symptoms, namely, the paralysis of the abducens nerve A large growth may invade the area of the brain without producing any symptoms whatever because the growth infiltrates around the nerve fibers without interfering with their nutrition or subjecting them to pressure

DR GEORGE W MACKENZIE Philadelphia I wish to confirm Dr Williams' remarks and also what Dr Carpenter said in reference to careful history taking A patient who had a large cyst of the frontal lobe prior to operation had no symptoms other than severe headaches very marked choking of both optic nerves and symptoms referred to the vestibular apparatus Although hearing was normal spontaneous nystagmus was marked when looking in any direction The patient had bilateral pastpointing inward of about eight or nine inches I made a diagnosis of lesion of a silent area operated, and recovered a large cyst about the size of a goose-egg The point was, and this applies to the diagnosis of stem lesions as well that we must reckon with what the Germans call "fernwirkung symptoms which by the way, was not original with them. In Sir William MacEwen's work on pyogenic infections of the brain and cord, written in 1893, he dwelt on the fact that lesions such as tumors in one cerebral hemisphere can cause pressure on the opposite side of the medulla oblongata by impinging against the rim of the foramen magnum with symptoms referable to the side of the pressure We must constantly reckon with symptoms of this kind in all cerebral lesions capable of producing intracranial pressure Furthermore it is a generally recognized fact that the earlier symptoms in intracranial conditions especially when of an inflammatory nature, are irritative in character, later we find them paralytic In studying the history of a case if we are able to determine just where the first irritative symptoms began we are often able to determine the site where the lesion began

DR JULIUS GRINKER Chicago In the last few years neurologists have been at a loss to know what to do with their cases The surgeons have taken up brain surgery very reluctantly Some of them have displayed such ignorance of the anatomy and physiology of the nervous system that I hesitate to refer a case for operation although the lesion is localizable Few surgeons know enough about the nervous system to handle the tissues differently from the abdominal viscera, for instance Otologists seem to know much about the nervous system I saw Dr Jones demonstrate his theories of localization in cases subjected to surgical intervention particularly one in which I made the diagnosis By his tests he localized the lesion for which that patient had been operated on There are two distinct sets of symptoms which enable a diagnosis of brain lesions to be made One is the irritation syndrome, the other the syndrome of destruction phenomena, applicable generally in cerebral lesions and to a lesser degree in cerebellar lesions In the irritation syndrome cases functions are somewhat exaggerated instead of a patient losing his hearing he hears too much there is tinnitus instead of a patient losing his sensations of pain he suffers from hyperesthesia In the other syndrome there are losses—such as deafness anesthesia etc This applies to manifest cerebral lesions but for the brain stem we must apply different standards because these lesions rarely give rise to general pressure symptoms In these lesions we need your help most because in the absence of pressure symptoms the first symptoms seem to be those of the localizing variety The same holds good for the space between cerebellum and pons

DR EUGENE R CARPENTER Dallas Texas For a long time the ophthalmologist and otologist have been interested in the intracranial side of our specialties but not until Barany brought out his work were we so deeply interested His observations extended over several years Later George MacKenzie of Philadelphia did some valuable work in reporting his experience while associated with Barany and individually in establishing the time of twenty four seconds for after-turning nystagmus Harvey Cushing later reported his experience with tumors especially of the auditory nerve and other tumors involving the cerebellopontile angle Still later, Jones and Fisher of Philadelphia published their work on equilibrium and vertigo and although I do not agree with them in everything it has stimulated interest in intracranial work more than anything that has been produced and were half the things in the book wrong we should be grateful for the work they have done We should be very careful in using isolated neurologic tests for making diagnosis in intracranial work as it is a most difficult field and if we do that the time will come when we will bring discredit on ourselves As to the otologist going into this line of work it has been forced on us We waited many years for the neurologist to develop something to help us out materially in reference to deafness The further development depends on otology

---

THE PERSONALITY OF THE PATIENT

A NEGLECTED FACTOR IN TREATMENT*

LOUIS CASAMAJOR M A M D

Professor of Neurology Columbia University College of Physicians and Surgeons

NEW YORK

The truism that the physician should treat patients rather than diseases has become so much a medical platitude that usually it is not appreciated in its full meaning To most physicians it means that therapeutic indications depend more on the individual variations of the patients' reaction to the disease process than on any intrinsic nature of the disease itself This individual organic reaction is ever an important factor in symptomatology, especially in acute diseases, but besides this there is the individual psychologic reaction to disease, which plays an important part in the symptomatology, prognosis and treatment of all diseases, but principally those of chronic course Disease, and more especially chronic disease is an added experience element in the life of the patient and one that must be considered in his adjustment to his life both present and future Chronic organic disease usually necessitates a change in the patient's mode of life makes life more complicated and often less pleasant and thus forces on him an adjustment to less ideal activity and interests usually quite at variance with his former life

*Read before the New York [illegible]

Thus, in all diseases of long duration, frequently there comes sooner or later to the attention of the physician a group of symptoms which, although they have nothing to do with the organic groundwork of the trouble, yet may cause more real difficulty to the patient than those more real in nature Usually these are passed over lightly as "neurotic symptoms," and the patient is left to suffer more in mind than he does in body This is a mistake, for these are the symptoms that can be removed, greatly to the comfort of the patient, a process all too frequently done by the "faith healer" or other quack, all to the detriment of the physician The physician who understands and treats the patient should be the one to understand and remove these symptoms, and only when he does this does the physician justify the ideals which the community holds for him

My purpose is to point out the origin and nature of these added symptoms appearing in chronic organic diseases, and their importance and significance to the patient Probably it is better to term them "personality symptoms" rather than simply to name them "neurotic symptoms," for by such a term we are likely to remove them too far from their real connections with disease They are "patient symptoms" in contradistinction to "disease symptoms," and they represent the psychologic readjustment of the patient to his environment, now further complicated by his disease and his realization of his lessened efficiency, which the true disease symptoms have forced on him A case in point may not be out of place

B D, aged 43, a waiter, came to the Vanderbilt Clinic complaining of insomnia, nervousness, tremulousness, excitability when subjected to sudden noises, and pain and hot feelings in the back of his legs and thighs Formerly he had had a business of his own, but two years previously he failed and had been obliged to accept a position as a waiter in order to support himself and his family He had never been content with this adjustment and, with the mounting cost of living, his life had become more difficult About one year before, the nervous symptoms mentioned began to appear, and they had gradually become worse For the last thirteen years his vision had been failing especially his ability to see clearly in the dark or in very bright light At that time he was told in an eye clinic that he had "night blindness" This condition had progressed but slightly, for his vision now was 20/50 About five weeks before coming to see us he was struck in the leg by a motor truck He was laid up at home with pain in his leg for a few days, but soon was again obliged to take up his work to support his family At this time the pains and hot feelings in his thighs and legs appeared, and were present only during the day while he was at work Physical examination was entirely negative except for some narrowing of the visual fields, and a retinitis pigmentosa of moderate degree

Most interesting in this case is the fact that the patient voluntarily came to a neurologic clinic with a history of symptoms quite "neurotic" Only on extended questioning was one able to bring out symptoms of the organic disease from which he was suffering To his mind the psychic symptoms were the more important, for they occupied his thoughts much more than did his vision difficulty, and interfered much more with his efficiency as a worker These were the "personality symptoms" in this case, and represented the reaction of the patient to his life, now made further unpleasant by the presence of the organic disease whose results he feared

The meaning of the "personality symptoms" is clear Excitability to noises, tremulousness and anxiety are all symptoms of fear, and fear was the predominant psychologic element that his organic disease had injected into his life He had been told he would never get well and in all probability would eventually lose his sight This prognosis and the fear it engendered altered the whole course of his life Another individual of different personality, possibly more philosophical, might have accepted the condition as it was and not have developed such active fear, and so not altered his attitude toward life However, our patient was of different fiber, and complicated his unhappy lot by the addition of a group of fear symptoms of his own making

He began to take more interest in himself than in his business and, following his business trouble, he accepted the position of waiter because he lacked ambition to build up his own work again, and the position of waiter was an easy compromise in the difficulty in which he found himself It was not satisfactory, for he felt that his earning capacity had been permanently diminished by factors over which he had no control, namely, the organic disease This disappointment, then, gave rise to the depression with the anxious coloring which dominated the clinical picture when he came to us, which was manifested by the "neurotic symptoms" These are the symptoms that are capable of removal, while those of his retinitis are not To remove these symptoms would be to increase his happiness and raise the level of his efficiency as an earner, probably to very nearly his former level This neurotic part, then, all too frequently neglected, should be the part to receive the greatest attention of the physician, for it is with this part that the best therapeutic results are possible

This patient reacted psychologically in this way to retinitis pigmentosa It is most probable that he would have reacted in quite the same way to any other chronic organic disease that impaired his efficiency and darkened his future In this man we would have expected to see the same symptoms had his organic disease been chronic nephritis, diabetes, chronic arthritis, chronic cardiac disease or arteriosclerosis

These neurotic or personality symptoms we see appearing in many patients with chronic disease, and in every case they depend on the personality of the patient and his psychologic reaction to his disease, and not primarily on the disease itself Not all individuals suffering from these chronic diseases complain of the same neurotic symptoms, and many never develop such symptoms at all or allow their disease materially to alter their attitude toward life This difference depends on the individual psychologic differences between patients that thing we call personality

When one comes to analyze the foundation of these 'personality symptoms," a number of factors readily come into view Probably the most important of these is the element of "temperament" of the individual Often it is extremely difficult to determine on what this is based We know one person to be optimistic and another pessimistic in his general outlook on life, one is naturally euphoric and another easily depressed, one is care-free and another full of worries, one is goodnatured and another irritable and quick to anger, one altruistic, another primarily selfish An attempt to analyze such characteristics takes one deep into the field of psychology, yet a few of the most prominent factors may be mentioned

Age plays an important part Youth is hopeful, old age is sad The attitude toward chronic disease fre-

quently reflects this age element The hopeful attitude of the tuberculous, especially those of early adult life, is proverbial, and most likely depends more on the age of the patient than on anything in the disease itself The carcinomas, on the other hand, are usually seen in later life, and here again the hopeless depression is, in part at least, a symptom of the age of the patient Besides this there are many other factors which determine temperament, the racial traits in the patient, the history of his life's experience, the hardships he has undergone, and lastly that thing which we call "feeling of well-being," in which we find many elements, but especially the proper working of his bodily organs, in the disturbances of which his disease itself may play no inconsiderable part

Given, then, the individual of a certain temperament afflicted with a chronic, but not disabling, disease, we may see extra personality symptoms arising in the clinical picture according to the patient's needs, and often these symptoms completely obscure those of the original disease Two questions naturally come to mind Why does the patient need these extra symptoms, and where does he get them?

The need for the extra symptoms springs from the patient's need to express the feelings that his disease engenders in him, in terms more understandable to himself and others In the first place, the realization that he is diseased brings with it a feeling of personal insufficiency and inadequacy to meet the requirements of his existence Often he now begins to care for his health for the first time in his life, and this introspection leads to an introversion of interests so that he may give consideration for his health an excessive relative value over the other factors of his life We then say that he has become "hypochondriacal" He seeks for symptoms in himself, and when he seeks he finds, often in the exaggeration and perpetuation of temporary symptoms formerly unheeded

Another factor not to be too lightly valued is the striving for sympathy a real need to the sick human being While we sympathize with chronic disease as a theoretical proposition, yet in the concrete we sympathize only with symptoms Hence the need of these extra symptoms to get for the patient the sympathy and consideration he feels is but his just due If his disease has few outward manifestations to call for sympathy he can, if he needs, develop others, in the form of pains, weakness and anxieties, all of which impress the beholder

The source from which these extra symptoms are derived is suggestibility, that all-important element in human psychology Suggestibility is the ability to accept with conviction a communicated proposition in the absence of logically adequate grounds for its acceptance It is the basis for faith and belief, and the human mind believes always just what it wants to believe This increased suggestibility of the chronically diseased may depend on one or both of two factors (1) an abnormal state of the brain caused by the disease process, or (2) a deficiency of knowledge of the nature of the disease and what symptoms it may cause

To the hypersuggestible patient who needs extra symptoms, suggestion for the formation of new symptoms comes from many sources and in varied forms From his own past experience with disease and neurosis he may cull much that meets his needs The conversation of kind and sympathetic friends is usually a rich field for suggestion The reading of medical books and articles and "patent medicine" circulars will provide any number of useful symptoms And the suggestion all too frequently comes from the physician, often from an unfortunate chance remark or even from the expression of the face during an examination It was frequently said in the British army in the war that many soldiers got 'soldier's heart" from a medical board

These extra symptoms in organic disease should receive the most careful attention from physicians Often they are more disabling than the disease itself Anyway they are more susceptible of removal, and by their removal the patient's happiness and efficiency is improved In the technic of removal one must counteract the factors that have caused them The temperament of the patient is often susceptible of improvement by a better understanding of himself and his motives The need for the extra symptoms is often still more difficult to combat This need may be lessened, in the first place, by a more accurate knowledge of the nature of his disease and its processes Then again the patient's adjustment to his disease and his lessened efficiency may be made more compatible with mental health and happiness Many physicians do this by telling of other patients with the same disease who had made better adjustments, and by giving the details of how it was done And lastly, symptoms due to suggestion may be removed by contrasuggestion Suggestion has ever been a considerable part of the armamentarium of the successful physician, suggestion by word, by act and by attitude, as well as suggestion connected with physical and chemical therapeutic practices, and this healing suggestion should be applied to the organically ill quite as much as to the pure neurotic

40 East Forty-First Street

Clinical Notes, Suggestions, and New Instruments

THE BEDSIDE DETERMINATION OF THE BLOOD UREA NITROGEN

EDWARD STEINFIELD M D Philadelphia

Although the determination of the urea nitrogen of the blood has become an invaluable procedure as a diagnostic and prognostic indicator in diseases of the kidney it has been relegated to the laboratory because of the time consuming and technical details connected with all usual methods The desirability however of having a simplified even though approximate method of measuring nitrogenous waste retention becomes apparent in those cases in which for one reason or another the laboratory is not available Of distinct value in this direction has been the method recently described by Myers[1] For some time a method similar in principle though differing in its end reading had been used by me and ample data had accumulated to demonstrate its accuracy to a fair though approximate degree as a rapid clinical test

The method utilizes the procedure of Folin for coagulation of blood proteins by sodium tungstate and ⅔ normal sulphuric acid The tungstate and acid are however added first before dilution with water and after incubation with urease this procedure has given rapid coagulation and uniformly clear filtrates A 1 10 dilution of the filtrate is used and the color produced by the presence of Nessler's solution is compared to a set of artificial standards described in detail by

From the Laboratories of the Graduate School of Medicine University of Pennsylvania Dr John A Kolmer director

1 Myers V C Chemical Changes in the Blood in Disease I Latent Nephritis Am J M Sc 165 418 (April) 1923

2 Folin Otto and Hsien W u A System of Blood Analysis J Biol Chem 38 81 (May) 1919

The reason for diluting the filtrate is to avoid the greenish discoloration and precipitation produced by the presence of amino-acids and peptones, as pointed out by Folin

METHOD IN DETAIL

Blood is taken from a vein or finger puncture into a test tube containing a few crystals of potassium oxalate to prevent coagulation Two c c of this sample are allowed to drain from an Ostwald pipet into a large size test tube A crushed tablet of urease (0 1 gm) or 1 c c of a urease solution prepared after the method of Folin and two drops of a buffer solution[3] are added to the same tube The test tube is then placed in a tumbler or beaker of warm water with the temperature approximately from 45 to 50 C for ten or fifteen minutes At the end of this period 2 c c of a 10 per cent

RESULTS OF BLOOD UREA NITROGEN DETERMINATIONS

Number	Mg Urea Nitrogen per 100 C c of Blood: Clinical Method	Van Slyke-Cullen	Diagnosis
1	80	83	Chronic diffuse nephritis

34	15	16 3	Normal
35	15	15 1	Normal

sodium tungstate solution and 2 c c of ⅔ normal sulphuric acid are added the tube being agitated during the addition of both solutions Thirteen c c of distilled water is added if 1 c c of urease solution has been used or 14 c c of water if a urease tablet has been used The contents of the tube are thoroughly mixed, a clean rubber stopper being used if necessary and filtered through a small glass funnel and filter paper (about 11 cm in diameter) into a clean test tube It is advisable to replace the first 1 or 2 c c of filtrate back on the filter During the process of filtration a large size test tube is prepared by placing in it 8 c c of distilled water and 1 c c or about 10 to 12 drops from a dropping bottle of Nessler s solution To this tube is added 1 c c of the filtrate and the resulting coloration is compared with a set of artificial standards To prepare these standards 1 c c of a standard ammonium sulphate solution (of which each 1 c c is equivalent to 0 1 mg of nitrogen[4]) is added to a test tube containing 8 c c of distilled water and 1 c c of Nessler's solution The color produced may be imitated by a permanent standard prepared by the mixture of 59 c c of fifteenth molar acid potassium phosphate and 41 c c of fifteenth molar alkaline sodium phosphate To every 9 5 c c of such a solution is added 0 5 c c of a 0 05 per cent solution of phenol red The hydrogen ion concentration of this solution lies between p_H 6 6 and p_H 6 8 Since 1 c c of the filtrate in the test is equivalent to 0 1 c c of blood a standard prepared as above matched by 1 c c of the filtrate would be equivalent to 100 mg of urea nitrogen per hundred c.c of blood A series of standards down to 20 mg of urea nitrogen with intervals of 10 may be prepared from the 100 by diluting out the color with this prepared solution of phosphates, correcting them afterward by comparison with the corresponding dilution of the ammonium sulphate standard These artificial standards may then be used and remain constant for some time if kept in tubes of non-sol glass, sealed, and kept in a dark place when not in use[5] The same precautions in preparing the solution of phosphates are employed as in making standards for hydrogen ion readings In bloods with low urea content 2 c c of the filtrate should be taken and the result is therefore half of the corresponding standard The colors may be matched in small test tubes by placing them in a box similar to that used in phenolsulphonephthalein determinations

Certain precautions are necessary to insure accuracy All reagents and the distilled water must be free from ammonia The water must also be free from traces of organic matter The presence of such ingredients can be detected by adding 1 c c of the standard ammonium sulphate to 8 c c. of distilled water, and last adding about 10 or 12 drops of Nessler's solution No cloudiness should be produced in the first few minutes

The urease must be known to be active or be checked up by its action on a known solution of urea Nessler's solution may be prepared after the method of Bock and Benedict by adding 100 gm of mercuric iodid and 70 gm of potassium iodid to about 400 c c of water This is rotated until solution is complete One hundred gm of sodium hydroxid is dissolved in about 500 c c of water, cooled thoroughly, and added with constant shaking to the mixture in the flask, and then made up with water to the liter mark The ingredients used must be of highest grade purity The directions of Folin may be used if satisfactory mercuric iodid cannot be obtained

The results of a series of tests made with this method and controlled by a standard method, such as that of Van Slyke and Cullen, are outlined in tabular form The controls to Specimens 26 to 35 inclusive, were performed by the chemist, Dr R A Lichtenthaeler

CONCLUSIONS

1 The determination of blood urea nitrogen may be made a clinical or bedside procedure by the use of a rapid and simplified method

2 The results though approximate are sufficient to be of diagnostic and prognostic aid and compare to a fair degree with standard laboratory methods

3 When possible, the more precise laboratory methods should be used later as a check on the clinical determinations

3 Fourteen gm of sodium pyrophosphate in 0 5 normal phosphoric acid up to 100 c c

4 Forty even-hundredths gram of ammonium sulphate of highest purity to a l ter of distilled water

5 The standards and other accessories may be obtained from Edward P Dolbey & Co Philadelphia

A CASE OF PITUITARY DISEASE

CHARLES G BEALL M D FORT WAYNE IND

History—C Z , a boy, aged 17, whom I first saw, Aug 12, 1919, whose mother and father were living and well, had two sisters living and well The mother s mother was insane. The father was a short stocky man whom the boy resembled in build At the age of 12 the patient had mild typhoid, and after this his mother thought he was different, not quite so quick mentally As a youngster he did well in school , he never failed, and went through the eighth grade at 15 years One year before I saw him, while messenger boy at the General Electric Works he noticed that his legs were getting weak, he had insomnia for one month, and the abdomen became large but in the last six weeks the abdomen had become much larger In the last year the head, shoulders, back and abdomen had become very fat The patient had been working for two years His only complaint now was that his legs were somewhat weak, i e, his body was too heavy for his legs (and it looked that way) His mother said his hair had always been fine, but it had become thinner in the last year

When he tried to lift anything he had pain in the lower dorsal region He had an occasional headache He said he was not drowsy or sleepy His mother said there had been no change in mentality He took thyroid for three months without any change in bodily contour, but it did make him more active His mother said he was an inch shorter than he was one year before He had a mustache at 14

Physical Examination—He was a short, squat boy the face very fat the neck short and obliterated by fat, he was very hairy all over the body The chest back and abdomen were fat the legs and arms almost spindling The strength of the extremities was greatly diminished The hands were small, the fingers tapered, cold and clammy He had a good color The thyroid was not palpable There were no palpable glands, the spleen was not palpable, nor was the apex Cardiac dulness was not increased and there were no murmurs The arteries were soft The systolic blood pressure was 165, the diastolic, 120 The pulse was 80 and regular The nose, throat and lungs were negative The liver was not palpable and there was no mass tenderness or free fluid in the abdomen He was very potbellied There was some tympany There was much fat in the abdominal wall The pupils were equal, reacting to light The knee jerks were sluggish, but equal The fundi were negative (left eye error of refraction) There was no edema the skin was rough and dry, scaly, with many areas of dirty exfoliating epithelium, and several linae albicantes (red) August 12, the urinalysis revealed a specific gravity of 1 017, there was an alkaline reaction, there was no albumin and no sugar, August 18, there was a specific gravity of 1 022, with an alkaline reaction but no pus no casts, no albumin no sugar and no diacetic acid The phenolsulphonephthalein test, first hour, showed 42 per cent The glucose test showed sugar in urine

Roentgen-Ray Examination—The right lateral and right lateral stereoroentgenogram of the head disclosed a shallow pituitary fossa and erosion of the posterior clinoid processes

Clinical Course—The boy continued in about the same condition December 5 the weight was 121 pounds The subjective symptoms were practically the same The pulse was 114, with an occasional systole The blood pressure was 165 The urine contained a moderate amount of albumin but no sugar or granular or hyaline casts His condition remained unchanged and he was able to do a moderate amount of light work Jan 30 1920, he became acutely ill with fever, cough and bloody expectoration and these symptoms continued until his death, three days later

Necropsy—This was held twenty-four hours after death and after embalming Examination of the lungs revealed bronchopneumonia and pulmonary edema The heart was negative There was cloudy swelling of the liver There was subacute nephritis The suprarenals, pancreas stomach and intestine were negative There was much fat in the abdominal wall and omentum The brain was normal On inspection of the pituitary fossa the body was seen protruding and elevated on the left side On attempted removal of the sella turcica intact there occurred a spurt of fluid from the sella and the body partially resumed its normal position

Dr V H Moon of Indiana University reported

I have made a careful study of sections of the pituitary body which you sent me some time ago On one side there is a small adenomatous growth of gland cells in the anterior lobe This growth has crowded the normal gland cells to one side and is separated from them by a thin wall of fibrous tissue The growth is very soft and vascular and the cells are arranged peripherally about the vessels and capillaries four or five cells deep There is very little fibrous stroma in the growth The cells are rather regular in size show no mitotic figures and are basic staining They have less of cytoplasm than the cells of the normal gland There is a delicate diffuse increase of fibrous stroma throughout the normal gland substance of the anterior lobes on both sides Otherwise the gland substance shows no changes The substance of the posterior lobe is apparently normal

If the cells of the adenomatous growth have the power to produce the characteristic secretion of anterior lobe cells such a case would show clinical symptoms of hypersecretion If they do not have that power there would be evidence of hyposecretion due to the normal cells being displaced by this nonfunctioning adenomatous growth Adenomas of this character are described as producing both types of pituitarism'

OBSERVATIONS ON SOUTH AMERICA

III CHILE

WILLIAM J MAYO M D
ROCHESTER MINN

In the latter part of the nine crowded years of Pizarro's life he started two expeditions south of Peru, into the country called Chile The first expedition was beaten back by the valorous Araucanian Indians The second met somewhat better success, but the Indians were not conquered Eventually after more than 100 years of ruthless warfare an armistice was arranged which ended in an alliance It was these brave Araucanians who gave the native strain to the Chileans, the most militant people of South America

The troops in Chile are German trained Before the Great War the uniforms, helmets, and general equipment were German but they have been changed to English designs The cavalry horses are beautiful and well trained In the navy the training and equipment have always been British

The long-standing boundary dispute between Chile, Peru and Bolivia is a source of friction and a peaceful Pan-America depends on its settlement There are from four to five million Chileans on 2,700 miles of Pacific coast, an approximate distance of as far as from Alaska to a point opposite Mexico City Undoubtedly the Chileans feel cramped on this narrow strip of land, a little less than 300 000 square miles, and it is only human that they should look with appraising eyes on the great countries of Bolivia and Peru The Chilean military attitude is the index to his characteristics, that is efficiency and self-reliance

Chile has the finest railroad system in South America, both for military and for civil purposes American equipment, with Pullman cars, etc, are used There are no lotteries or open gambling in Chile, and a strong prohibition party exists, with evidences of control of the liquor traffic

The port towns of Arica, Iquique and Antofagasta have hospitals, all of which we visited We visited also a large military and civil hospital in Tacna situated in a fruitful oasis near the Peruvian boundary The hospitals of Chile are supported largely by the state The hospitals at Iquique and Antofagasta are much larger and have better equipment than those at Arica and Tacna They are under the direct charge of a progressive Catholic bishop and are managed by French and Italian Sisters Each hospital has a training school for about forty nurses, drawn from the lower and poorly educated classes, who are really drudges for the sick rather than nurses and a training school for about thirty midwives The bulk of the patients in these hospitals are from the outlying nitrate (saltpeter) mines The buildings are unscreened and although flies are not usually numerous they are uncomfortable evident in the medical wards Water is scarce in this

rainless region, it is piped from the mountains long distances, and is expensive Lack of trained nurses, lack of adequate water supply and lack of screens are the weak features in an otherwise excellent hospital system, but these defects are being rapidly overcome The great American mining corporations on the coast and inland, such as the Guggenheims, have their own hospitals These corporation hospitals are screened and thoroughly equipped with American appliances, and have American physicians and trained nurses Dr W F Shaw, who has had twenty years' experience in the tropics, is in charge of the Guggenheim hospital

Valparaiso, a city of about 280,000, has a number of fine hospitals, built with the high ceilings, verandas and patios typical of the Spanish plan There are separate hospitals for men and for women, and for children under 10 years of age All the newer hospitals are built on the general type of the American hospital, with pavilions for men, women and children, the same operating rooms, laboratories, etc, are used for all There are pavilions for private patients in which the rates, the cheapest of any in South America, range from $2 50 to $10 a day, gold This includes ordinary nursing and medical care No fee is charged for operations if they are performed by the surgeon who is paid by the year from the hospital fund Other surgeons make their own arrangements with patients The British and American residents maintain a hospital of about 100 beds It is under the supervision of a British surgeon who, since he has no license to practice in Chile, employs a Chilean licensed physician to act obstensibly as chief This subterfuge is employed also in some of the large mining hospitals Needless to say, such arrangements are sources of irritation to the Chilean physician A hospital is maintained by the German colonists located on a sightly spot on a hill The attending surgeon is Dr Munich, grandson of a German colonist, and one of the best surgeons in Chile

A schedule of operations performed in the hospitals in Valparaiso, Feb 13, 1920, is as follows

German Hospital Dr Munich
8 00 a m Nephrectomy
8 30 a m Intervention for cholecystitis for an old fistula between the gallbladder and small intestine
11 00 a m Hernia
11 30 a m Hemorrhoids
Hospital de San Agustin Dr Iturrieta
9 30 a m Cancer of the uterus, cesarean section for constriction of the pelvis
8 15 a m Dr Engelbach Cholecystectomy for biliary lithiasis
Hospital of San Juan de Dios, Dr de la Fuenta Cholecystectomy

Santiago, the capital and largest city of Chile, is situated at an elevation of 2,000 feet on the river Mapacho in a valley surrounded by snow-capped mountains The site of the city is unusually beautiful, and, unlike the cities farther north in Chile and Peru, it is blessed with rain The city government is progressive and excellent All things considered, Santiago may be said to be the most beautiful residential city on the west coast, if not in South America

The hospitals in Santiago are very good The old ones are being remodeled along American lines The surgeons are doing excellent work Prof Lucas Sierra, well known in America was abroad preparing plans for greater hospital extension His colleague, Dr Amunategui, dean of the medical school, and one of the foremost surgical teachers of South America, was in the city, but expected to leave shortly to join Dr Sierra on his mission

There is but one medical school in Chile, and that is in Santiago The school compares favorably with medical schools in other countries Opportunities for English and American physicians in Chile are not alluring Examinations to qualify for practice are given in Spanish, they are highly technical, and are given under conditions that have not been surmounted by any American physician in recent years When it is taken into consideration that the school in Santiago has a seven-year course and 1,000 students, of whom only about thirty-five of the senior class succeed in graduating each year, the natural handicap is easily seen Some of the students who eventually graduate spend eight, nine or even ten years in preparation for the final degree A fine hospital of 700 beds is directly associated with the medical school The buildings for both institutions are spacious, dignified and well equipped, and are situated on a large, beautiful tract in the heart of the city We attended a number of interesting surgical clinics and demonstrations Professor Noe, who was trained in Italy, showed us some very beautiful specimens of *Ancylostoma duodenale*, with microscopic slides This disease was first found in men working in the Simplon tunnel in Switzerland and is endemic in certain mines in Chile We were interested also in the treatment of anthrax by Lugol's solution, which appeared to be extraordinarily efficient

The Public Assistance Association in Santiago should be mentioned especially It is supported by the state and municipal governments, and is under the control of the faculty of the medical school The association has its own hospital, in which all emergency surgery is done Ambulance stations are located in different parts of the city, centering in one hospital which is in direct communication with the criminal courts All postmortem examinations are conducted under the medical jurisprudence department of the medical school, in marked contrast to the inefficient coroner system in the United States All cases of stabbing, shooting and accidental injury pass through the hospital, and the student derives the benefit of all medical and legal examinations The uneducated native Chilean settles his disputes with the knife and inflicts ghastly wounds, which make the razor slashes of our nonvoting voters south of the Mason and Dixon line appear trivial in comparison I was told by a Chilean surgeon that when the Roto takes out his knife, all South America squeals and runs Any one seeing some of the injuries he inflicts would certainly be inclined to lead in the running

The ambulance service is quite remarkable This was demonstrated by a call from the Institution of Physical Culture and Therapeutics to one of the most distant stations in the crowded part of the city The dean stepped to the telephone, put in the call for public assistance, and shortly a peculiar, high-pitched horn was heard in the distance All traffic stopped at once, and in two minutes and forty seconds an ambulance with two physicians and a nurse in attendance was at the door Temporary assistance may be had on telephone call day or night in any part of the city by any person, rich or poor, who is sick or in trouble

The new dental college, connected with the medical school and under the direction of Dr German Valenzuela, professor of maxillofacial surgery, is an institution which is of interest not only professionally but

historically The equipment is American and is complete in every respect The instructors are men who have been trained in Philadelphia The circumstances which led to the building of the dental school would furnish a thriller for the movies, the story was told in the presence of Dr Valenzuela, who was obviously very much embarrassed

In 1909, the consul general of Germany was found murdered in the basement of the burned German embassy building in Santiago The safe had been emptied of a large amount of negotiable securities Notwithstanding the care of the assassin to destroy completely the building, much of it was saved by the excellent fire department, and the body in the basement was not wholly consumed, and was identified as the German consul by the finger rings, watch, parts of clothing, hair and mustache The janitor, a younger man of about the same size and general appearance, had disappeared Germany, at the height of her power, was justly indignant over the crime, Chile, profoundly disturbed, did everything possible to mollify the kaiser, and made preparations for an ostentatious funeral with naval and military parades Eulogies of the dead consul were made by high officials of Chile and by foreign diplomats Under the international law the embassies and consulates are under the jurisdiction of the countries they represent but the Chilean law required an examination of the body before its burial Dr Valenzuela in conducting the examination observed the perfect condition of the teeth They were complete, except for one third molar, which had been extracted, this was inconsistent with the age of the consul The bereaved Chilean wife of the consul was interviewed, and said that her husband had had a great deal of dentistry done, and she gave the name of the dentist who had done the work The dentist's records showed that various gold fillings, bridges and artificial teeth had been inserted The janitor's wife stated that her husband had a full set of teeth with the exception of one wisdom tooth

The two feasible means of escaping from Chile are by the Transandean railway and by the sea and the former is often obstructed by landslides and washouts An order was given to close the frontiers and the German consul in disguise was discovered at the Argentine border, where he had been held on his way to Buenos Aires by an avalanche temporarily obstructing the train The money taken from the vault was found in a belt around his person He was tried and executed for the murder of the janitor, whom he had stabbed shaved, and dressed to change his appearance, he had then robbed the safe and set fire to the building The affair created a sensation, and Dr Valenzuela was called before the Chilean senate and congress, who rendered public recognition of his service He was asked to name his own reward, and made the request that $700,000 should be given to build a dental college on the American plan a project he had been working on for ten years The request was granted at once, and the splendidly equipped institution is the result

The Chilean people are independent and self-reliant They are imbued with the American spirit of progress and efficient organization At a banquet one night, wishing to honor the Chileans I said Chileans are the Yankees of South America! There was no applause and I did not repeat the offense

Our reception in Chile was very cordial, and everything possible was done by both the government and the medical profession to give us information and opportunities to examine their educational institutions hospitals and clinics The medical profession in Chile stands very high in the estimation of the people and may be said to be the most influential of the professions The leading medical men have taken postgraduate courses abroad and many of them are graduates of the best continental schools The surgeons of Chile are a splendid body of men and it was a great pleasure to see their work and to study their methods

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION W A PUCKNER, SECRETARY

BENZYL BENZOATE (See New and Nonofficial Remedies 1920 p 49)

Benzyl Benzoate-Seydel — A nonproprietary brand of benzyl benzoate complying with the tests and standards for benzyl benzoate

Seydel Manufacturing Co Jersey City N J

DESICCATED PITUITARY SUBSTANCE (ANTERIOR LOBE)-ARMOUR (See New and Nonofficial Remedies 1920, p 207)

The following dosage form has been accepted

Tablets Anterior Pituitary Armour 5 grains —Each tablet contains desiccated pituitary substance (anterior lobe) Armour 5 grain

OVARIAN SUBSTANCE-ARMOUR (See New and Nonofficial Remedies 1920 p 202)

The following dosage form has been accepted

Tablets Ovarian Substance Armour grains —Each tablet contains ovarian substance-Armour grain

RIODINE —A 60 per cent solution in oil of an iodine addition product of castor oil Riodine contains about 17 per cent of iodine

Actions and Uses—Riodine resembles other fatty iodine compounds See general article Iodine Compounds for Internal Use New and Nonofficial Remedies 1920 p 143

Dosage —From 0 4 Gm to 1 2 Gm (6 grains to 18 grains) per day in capsule taken after meals Supplied only in the form of capsules

Manufactured by Pharmacie Viger Paris France (F Frederera and Co Inc New York distributors) No U S patent U S trade mark No 86974

Riodine Capsules 0 2 Gm (3 grains) —Each capsule contains 0 2 Gm riodine equivalent to about 0 033 Gm (0 5 grain) iodine

Riodine is prepared by treating castor oil with hydriodic acid

Riodine is an oil like liquid light amber in color having a faint alkaline reaction It is insoluble in water soluble in alcohol chloroform and ether

When heated it is decomposed and purple vapors of iodine are given off When heated with alcoholic potash riodine is saponified and potassium iodide formed

INTERNAL AND EXTERNAL ANTISEPSIS

In the modern history of the biologic sciences and particularly in medicine, antiseptics and germicides have played such unanticipated parts and have been responsible for so much which is good that they have furnished words to conjure with Every force that can be enlisted against baneful bacteria is promptly welcomed, but there are no "royal roads" to success in the warfare against these invisible foes, just as there are no panaceas with which every human ailment can be relieved Surgeons of the present day have seen the pendulum of operative practice swing between antisepsis and asepsis without discovering the ultimate ideal of a universally applicable scheme of procedure Only a few years ago, physicians were greatly exercised by the hope of finding a satisfactory intestinal antiseptic Naturally the possibility of being able to rid the alimentary tract of its undesirable microbiotic invaders aroused widespread interest Despite the numerous efforts to demonstrate the efficacy of this or that chemical agent or drug as a gastro-intestinal antiseptic, the outcome has been that the supposed benefits were due to catharsis in most instances rather than to any real effect upon the bacteria in situ The emptying of the bowel is, in truth, probably the most successful mode of decreasing its bacterial flora, according to present-day knowledge

An analogous story appears to apply to attempts to disinfect the outside of the body with alleged antiseptic products For a long time the claims of "healing" "antiseptic" or "germicidal" soaps have been flaunted before the laity as well as the medical profession Thanks to the efforts of Dr Norton,[1] working at the University of Chicago under the auspices of the Council on Pharmacy and Chemistry of the American Medical Association, the facts about "antiseptic" soaps have once more been presented in a true light He has demonstrated that in any event, the cleansing properties of a soap, such as the green soap used in hospitals or even ordinary toilet soaps, are more important than any added antiseptic or germicidal constituent According to Norton's demonstrations, which confirm previous experiments, sterile hands are not obtained in the ordinary process of hand washing Large numbers of bacteria are removed thereby, but more were actually found to be removed by ordinary soaps than by the specially advocated brands The presence of antiseptic chemicals, such as mercury salts, is likely to interfere with the production of a good lather, on which much of the detergent potency depends Furthermore, soap remaining on the hands after washing does not appear to have a germicidal potency

Let us by all means get rid of bacteria on polluted hands, which have been incriminated seriously of late in connection with the spread of disease, but let us also learn to avoid a false sense of security which some labels foster If the public is interested in "buttermilk" soap or "oatmeal" soap, both of which are chemical impossibilities even though they have been advertising actualities, no harm is done except, perhaps to the pocketbook But the words "antiseptic" and "germicidal" are too close to the sacred domain of hygiene and public health to be allowed a promiscuous use

BATHING AS A SOCIAL AMUSEMENT

Many persons at the present time look on baths and bathing in the light of hygienic necessity A study of the history of the bath, however, would reveal this institution as having many other aspects Its various alleged remedial values are conspicuous in the practices and traditions of hydrotherapy Bath resorts are proverbially medical centers in many parts of the world In the ancient days the various modes of bathing and bodily functions acquired an immense significance in the life of the elite in particular, as is attested by the elaborate ruins still extant giving silent evidence of the place of the bath amid the domestic institutions of other times

The counterpart to a visit to what is left in Rome of the baths of antiquity may be suggested by a trip to the Hot Springs or Carlsbads of today, even though the functions of the modern establishments may appear to be somewhat different Lest it be assumed that our own continent is devoid of old records of bathing pavilions of a specialized sort, we quote the observations of the pioneer American explorers Lewis and Clark In the diary of their memorable expedition up the Missouri and across the divide to the Pacific coast in the years 1804-1806 they give a unique description of the sweating baths of Indians they encountered The vapor bath or sweating house was a hollow square six or eight feet deep, formed in a river bank by damming up the other three sides with mud and covering the whole completely except for an aperture about two feet wide at the top The bathers descended through this hole, taking with them a number

of heated stones and jugs of water, and after being seated around the compartment they threw the water on the stones until the steam became sufficient for their purposes This mode of producing vapor appears to have been common

From the social standpoint it is interesting to learn through the account left by Lewis and Clark that among many of the Indian tribes it was very uncommon for a man to bathe alone The bather was generally accompanied by one or sometimes several of his acquaintances Indeed according to the explorers' information, bathing was so essentially a social amusement among these peoples that to decline going in to bathe when invited by a friend was regarded as one of the highest indignities that could be offered to him[1] The Indians on the frontiers nearest civilization generally used a bath which was formed of a wickered work of willow about four feet high, arched at the top, covered with skins, and adapted to a single person In this the "patient" sat until, by means of the heated stones and water, he perspired sufficiently Almost always these baths were in the neighborhood of a running stream, into which the Indians plunged immediately on coming out of the vapor bath, and sometimes returned again to subject themselves to a second perspiration "This bath," we read, "is employed either for pleasure or for health, and is used indiscriminately for rheumatism, venereal or, in short, all kinds of diseases" The same sentence might quite as appropriately be written today

DO THE CEREALS HAVE UNLIKE VALUES IN NUTRITION?

During the food crisis presented by the World War, it became necessary for the experts of the U S Food Administration to consider the seemingly mystical properties of wheat which had made it foremost in popularity among all its competitors in the domain of cereal foods Wheat is not so unique that it has attained an exclusive use throughout the world Rye, barley, oats, corn and rice are likewise popular in many places There are two principal ways of preparing cereals for the table one by baking into bread, the other by cooking in water The inhabitants of Europe and North America use their cereals mainly in the form of bread, most Orientals prefer theirs boiled, and use chiefly rice and corn The cereals differ more in their bread-making qualities than in their food value The proteins of wheat, rye and barley possess such physical properties that the flour prepared from them can be made into a dough that can be leavened or raised, and baked to form a palatable portable bread of excellent keeping qualities Oats, corn and rice may be cooked by boiling, but on baking they will yield cakes that are granular and will not hold together, and therefore cannot be transported except in containers

Despite the fact that the advantages of wheat evidently lie in the external qualities of the products prepared from it rather than in their inherent digestibility, there was much hesitation in employing the cereal substitutes that were urged on our people during the war This attitude of reserve at first was not occasioned merely by a lack of patriotism in following the requests of the Food Administration, but was due rather to a feeling of uncertainty as to physiologic values Would the health of the nation be impaired by the use of the substitute cereals, even if they could be made palatable and dietetically attractive? This and similar inquiries were more than once directed to our experts in nutrition

That all of the common cereals are readily digestible by man may be regarded as finally demonstrated All of them have virtually the same energy value approximating 1 600 calories a pound A 100-calory portion varies only from 25 gm for oatmeal to 29 gm for rice Much of the uncertainty has centered in the problem of the comparative value of the different cereal proteins Sherman[2] clearly demonstrated that the protein of corn is just as satisfactory to keep the body in nitrogenous equilibrium as is the protein of wheat, even when corn meal provides half of the calories and three fourths of the protein Subsequently Sherman and his collaborators[3] came to essentially the same conclusions with respect to the protein components of the oat and wheat With all three of the cereal grains (wheat, maize and oats) tested on man, it was found that a diet in which about nine tenths of the protein was derived from the cereal in the form commonly used as human food, the small remainder being furnished by milk or apple, need contain only from 33 to 40 gm of protein per 70 kilograms of body weight, or about 0 5 gm per kilogram, in order to meet the protein requirement of maintenance in adult human nutrition This is contrary to what some of the German investigators have led us to conclude The upshot of Sherman's studies is that the proteins of wheat, corn and oats appear to be about equally efficient in adult human nutrition and need only be supplemented with small amounts of milk in order to be fully as efficient as the proteins of ordinary mixed diets had been found to be in earlier investigations[4]

If further evidence were needed for the essential equivalence of the proteins of the commonest cereals it could be found in the recently published investigations by Osborne and Mendel[4] Contrasting wheat

with barley, rye and oats in experiments in which these served as the sole sources of protein for growth, these investigators have been forced to the conclusion that the proteins of the four cereals studied are not widely different in efficiency for this physiologic purpose It should not be assumed from this that the common cereal grains alone or even a mixture of them suffices to afford satisfactory nutrition The reason for the inadequacy is to be found primarily in a deficiency in certain of the essential dietary components, notably specific inorganic elements and fat-soluble vitamin However equal the cereals may be from the standpoint of comparative protein values, they need a supplement In this role no product surpasses milk But the day of "invidious distinctions" between cereals, from the physiologic standpoint, seemingly is past

THE OUTLOOK FOR THE MANAGEMENT OF DIABETES

In a recent issue of THE JOURNAL,[1] a review of some of the newer experimental studies on partially depancreatized dogs, showing many resemblances to typical cases of diabetes in man, pointed to the conclusion that a spontaneous progressively downward tendency is not necessarily an inherent feature of the disease in the animals Whether the conclusions arrived at, particularly through the investigations of Allen and his collaborators at the Hospital of the Rockefeller Institute for Medical Research, apply with equal probability to diabetes in man cannot yet be stated At any rate, through the demonstration that in diabetic animals the chief cause of downward progress is faulty diet, the practitioner is more than justified in attempting to eliminate this cause by avoiding the dietary injuries illustrated in the animal experiments

The clinical experience of Allen, Stillman and Fitz,[2] in applying the principle of the relief of patients through decreasing their metabolic burden, has given encouraging results, to quote Allen, in proportion as it has received application in practice He[3] has pointed out that the clinical problem requires the same prolonged careful control of all discoverable symptoms as in animals, and cases too severe for such control, or complicated with infections, violations of diet, etc, are on the same plane as animals in which a similar condition has been produced Some proportion of cases, especially in young persons, will be found suitable for accurate determination of the question of whether all or most cases of severe diabetes are inevitably progressive and hopeless

Overenthusiasm for any novelty is sometimes liable to damage the cause that has given birth to it Even the experiments on animal diabetes indicate limitations to the possibilities of the current proposals to spare the overburdened pancreatic function There is an unquestioned benefit from exclusion of preformed carbohydrate and limitation of protein (potential carbohydrate) intake in nearly all cases of diabetes—a benefit exhibited by prolongation of life and well-being to some extent in many cases, and perhaps indefinitely in the mildest cases But even the animal experiments show that in the great majority of instances such a therapeutic result is not permanent, and downward progress is finally observed if the observations are continued long enough The animal experiments do not support any exaggerated claims of cure As Allen[3] judiciously summarizes the present situation In most of these cases, life, strength and assimilation can be preserved for a much longer time by a degree of undernutrition suited to the severity of the diabetes, and accomplished by limitation of fat in the diet The permanence of such control is supported by the unimpaired or rising assimilation in experiments of one to one and three-fourths years' duration, but still longer observations would be desirable Diabetes of great severity is controllable only by correspondingly radical undernutrition In still more severe cases, glycosuria can be abolished only by a degree of undernutrition which entails final death from inanition In the most severe cases glycosuria cannot be stopped, evidently because the assimilative power is too low to dispose of even the minimum supply of food materials, namely, that derived from the body stores in fasting

If diabetes represents an organic deficiency, it is unreasonable to expect to cure rather than merely relieve it by diet This does not negative the possibility, however, that some day we shall be able to stimulate or strengthen the pancreatic function in some direct manner The newer studies on animals may better pave the way to such an achievement

Current Comment

HEALTH AND THE COST OF FOOD

Conditions entailed by emergencies arising from the war and subsequent events have placed an enormous emphasis on the food supplies of thousands of persons in many parts of the world The problem of adequate food allowances to certain groups of people is one of the subjects for necessary discussion at the various peace conferences Relief organizations are debating the same question from other standpoints As a consequence, the serious consideration of public health factors in terms of calories or nems, if Pirquet's new nomenclature is to be employed,[1] has something more than mere academic import at the present time In all schemes for nutrition of the masses, the possibilities

1 The Pirquet System of Nutrition Foreign Letters J A M A 75 332 (July 31) 1920 Faber H K The Pirquet System of Nutrition Am J Dis Child 19 478 (June) 1920

of a healthful diet are involved, not only by economic conditions,[2] but also by the limitations of income We have from time to time discussed the question of the minimum wage as it is affected by the price of food Marketing conditions are changing so rapidly that it is not easy to secure up-to-date estimates The director of the Dietetic Bureau of the League for Preventive Work, Boston, has recently calculated the cost of food in minumum allowance of essential nutrients necessary for health, on the basis of April, 1920, prices[3] Assuming that it was spent to the very best advantage, the lowest allowance on which the well-known statistical family of five could be fed safely was placed at $11 50 a week At a cost of 14 7 cents per thousand calories this would allow, for an adult man, 3,400 calories per day, including 100 gm of protein, 1 gm of calcium, 2 gm of phosphorus and 16 mg of iron, with an abundance of vitamins A safer allowance is placed at $14, or 60 cents for each adult daily In the price of good health which, the slogan says, is purchasable, the cost of adequate nutrition must be included

THE CHEMISTRY OF ODORS

Man and animals alike depend on their senses not only for physiologic delight but also for the warnings against various danger of their environment The "twin senses" smell and taste exercise a peculiarly valuable function in that they stand "like sentries at the portals of the body, where they closely scrutinize everything that enters" Slosson[4] has fancifully remarked that these two special senses lead us to the heart of the molecule and enable us to tell how atoms are put together Sounds and sights may be disagreeable, but they are never fatal A man can live, Slosson writes, in a boiler factory or in a cubist art gallery, but he cannot live in a room containing hydrogen sulphid Until recently there has been little dependable information available about the chemical nature of the odoriferous substances encountered in daily life The so-called essential oils, many of which have a "fruity" odor, have been prepared for some time in the laboratory Experts remind us, however, that the artificial fruit essences are usually composed of a mixture of substances without any guarantee of their actual occurrence in the fruits whose flavors they are supposed to represent An actual identification of the principal flavoring constituent of an edible fruit was apparently first accomplished in 1913 by Kleber,[5] who showed by accurate methods that ripe bananas actually contain amyl acetate the substance commonly designated as "pear oil" Recently Power and Chesnut[6] of the Bureau of Chemistry in the U S Department of Agriculture at Washington have unraveled some of the mysteries of the apple They obtained no evidence that amyl valerate, familiarly designated as "apple oil," is present in the fruit Its odorous constituents were found to consist essentially of the amyl esters of formic, acetic and caproic acids with a very small amount of the caprylic ester and a considerable proportion of acetaldehyd It is not unlikely that some of the alcohol and acids mentioned are also present in the free state All of these various substances occur in mixtures of varying proportions in the numerous varieties of the apple, thus giving rise to slight differences of odor The quantities actually present for example 0 0007 per cent in the Ben Davis and 0 0013 per cent of essential oil in the more odorous crab-apple, may seem small Nowadays, however, the physician who deals with antigens and antitoxins, with radium with vaccines and vitamins, has become accustomed to the possible potency of products in small quantities

NERVOUS IRRITATION AND TETANY

Tetany is a symptom that manifests itself under a variety of conditions which seem to be decidedly unlike in their pathologic aspects Thus, one may read of gastric tetany and parathyroid tetany without suspecting any immediate common cause Until somewhat recently the spasms were generally assumed to have a reflex origin, in those cases at least, in which they were associated with gastro-intestinal affections It is, of course, not difficult to conceive of a local irritation of afferent nerve endings leading to a tetanic outcome Latterly, however, alkalosis has been alleged to play a dominating part not only in the tetany associated with lack of parathyroid function but also in the symptoms attending gastric disturbances The *identity of clinical tetany with experimental parathyroid tetany* is by no means established Palmer[1] has argued that if irritation of the afferent nerve endings in the gastro-intestinal tract is ever of importance in tetany, it should be in that of parathyroid origin, for in this condition there is not only alimentary disorder but also a hyperirritable condition of both the central nervous system and the peripheral nerves Consequently he has attempted to determine in the physiologic laboratories of the University of Chicago whether afferent influences which reach the central nervous system through the vagi and the splanchnic nerves have any influence on the onset and course of parathyroid tetany Neither artificial gastro intestinal irritation nor double vagotomy and splanchnectomy seemed to exert any appreciable effect If it is justifiable to reason from such observations that these nerves are of no importance in tetanies associated with gastro-intestinal disorder the logical consequence is to favor a chemical explanation This is in harmony with the current tendency to emphasize the importance of toxic products of some sort in the genesis of tetany

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION, PUBLIC HEALTH, ETC)

ALABAMA

Physician Shot—Dr James G Wilbanks, Odenville, was shot and seriously wounded, July 25 by Dr William P Cooke cashier of the bank of Odenville The shooting is said to have been the result of an old grudge Dr Wilbanks is under treatment at the Birmingham Infirmary

Medical Officers Organize—Physicians of Birmingham who had served in the Medical Corps or Medical Reserve Corps of the Army during the World War met in Birmingham and organized the Medical Legion of the United States electing Dr William M Jordan, president, Dr Gaston W Rogers, vice president, and Dr Leo C Wood secretary, all of Birmingham

State Association Supported—The supreme court has affirmed the decision of the Montgomery circuit court which was adverse to the claims of Dr Thomas D Parke, Birmingham, and other physicians of Jefferson County that the legislature exceeded its authority in delegating health work to the Alabama Medical Association The association will therefore continue to name the state board of health and be the general authority for the enforcement of all state laws regarding health and sanitation

Medical School to Be Moved—The supreme court of Alabama has reversed the decision of the Mobile circuit court against the board of trustees of the University of Alabama The decision enjoined the trustees from moving the medical department of the university from Mobile to Tuscaloosa The higher court holds that the board acted fully within its powers The trustees in April ordered the removal of the medical school from Mobile to Tuscaloosa in accordance with an act passed by the Alabama legislature giving the trustees authority so to do in case the institution at Mobile failed to retain a Class A rating with the Council on Medical Education of the American Medical Association The university is establishing what will be practically a new medical school During 1920 1921 only the work of the freshman year will be given and in the following session two years of work will be given The clinical courses will not be offered until such time as the university feels that they can be established on a high plane

CALIFORNIA

Reciprocal Relations Established—It is stated that reciprocal relations have been established in medical licensure between the New York Board of Regents and the Board of Medical Examiners of California

Society Reorganized—At a meeting of physicians of Imperial County, held May 3, the Imperial County Medical Society was reorganized with an initial membership of twelve, and the following officers were elected president, Dr William W Apple El Centro, vice president, Dr Roy O Thompson Imperial, and secretary-treasurer, Dr Charles S Brooks, El Centro

Personal—Dr Fred P Bowen, Los Angeles, has started for France on his way to the Balkan countries where he is to study typhus fever——Dr Alva J Remmel has been appointed surgeon to the French hospital, San Francisco succeeding Dr Bertram F Alden resigned——Dr William A Hodkinson has been appointed health officer of Santa Monica, succeeding Dr Frank J Wagner, resigned

COLORADO

Radium Purchased—It is reported that the largest piece of radium, in the west, weighing ½ gm and valued at $56 500 was recently purchased by eighteen physicians of Denver

New Clinic Opened—A special clinic established in Leadville by Dr Samuel R McKelvey, Denver, is open on Mondays and Wednesdays from 4 to 5 p m, and on Tuesdays Thursdays and Saturdays from 2 to 6 p m, under the charge of Dr Franklin J McDonald

Specialists Meet in Denver—The Colorado Congress of Ophthalmology and Oto-Laryngology held a meeting in Denver, July 23 and 24, under the auspices of the Colorado Ophthalmological Society and the Colorado Oto Laryngological Society Drs Frank L Dennis, Colorado Springs Edward Jackson, Denver, Thomas E Carmody, Denver, and Harry W Woodruff, presided at the various sessions

DISTRICT OF COLUMBIA

Personal—At the annual meeting of the Indiana Society in Washington, Dr Harvey W Wiley was elected president

Regulation of Anesthesia—The Medical Society of the District of Columbia at a recent meeting adopted resolutions placing the society on record as in favor of the limitation of the practice of anesthesia to licensed physicians, surgeons, dentists and to graduate nurses in cases of emergency or medical students for the purpose of instruction The society asks that other local county and state societies adopt similar resolutions The society also adopted a resolution favoring the establishment of a section of anesthesia in the American Medical Association

FLORIDA

Sanatorium Opened—Dr Marvin Smith announces the opening of his private sanatorium and diagnostic institute at Jacksonville on June 15 The sanatorium is devoted to the treatment of gastro-intestinal diseases and diseases of metabolism

Another Plague Victim at Pensacola—John Henry Hudson Jr 19 years of age died at Pensacola July 14 the fourth victim of bubonic plague Dr Ralph N Green, state health officer immediately left for Pensacola to investigate the plague situation

Flagler Hospital Rebuilding—Following the fire which destroyed its building the Flagler Hospital at St Augustine has a new building well under way which it expects to occupy during the coming autumn The building will have a capacity of 100 beds

Personal—Dr James Q Folmer, Bonifay, has been appointed assistant physician at the State Hospital for the Insane Chattahoochie, succeeding Dr William M Bemis, who recently resigned to accept a position with St Elizabeth's Government Hospital for the Insane, Washington, D C

Government Buys Hospital—For the sum of $75,000 Lake City recently conveyed to the government 313 acres of rolling and attractive land with a number of buildings on it, for the site of a proposed government hospital The ground was originally the site of the Florida Agricultural College and later of the Columbia College, a Baptist institution According to a provision of the state legislature the money realized from the sale is to be devoted to educational purposes

ILLINOIS

Physicians Hold Outing—The midsummer meeting and outing of Jo Daviess County Medical Society was held at Camp 19 near Gordon's Ferry July 29 The address was delivered by Dr George B Eusterman of the Mayo Clinic, Rochester Minn, who spoke on The Medical and Surgical Aspects of Chronic Peptic Ulcers"

Personal—Joseph B Liston, Carlinville, has been reappointed health officer for Macoupin County——Dr Walter H Watterson Chicago has been appointed inspector of public tuberculosis sanatoriums throughout the state——Dr Oscar J Brown DeKalb is reported to have been found guilty with other members of the Communist Labor Party, July 30, and sentenced to imprisonment for one year in the county jail

Typhoid Fever—An outbreak of typhoid fever is reported in Pinckneyville Perry County, where seventeen cases have occurred and a second outbreak at Carmi, Pike County, where twenty cases of the disease have appeared——An epidemic of paratyphoid fever is reported at Fountain Green Hancock County where more than 100 persons are reported to be ill The cause of the disease is said to be chocolate ice cream which was served at a church sociable

Chicago

Sentenced for Sedition.—Dr Karl F M Sandberg one of the organizers of the Communist Labor Party and a delegate to the national convention, is said to have been sentenced, July 30, to imprisonment for one year in the county jail

Radiological Association Organized—The roentgenologists of Chicago met August 5, at the Hamilton Club and organized the Chicago Radiological Association, electing the following officers president, Dr Alonzo C Tenney, vice presi-

dents, Mr A M Olson and Mr J H Brothers, secretary, Mr J W Ross and treasurer, Dr John H Carpenter

Physician Fined—Dr R Staats who has an office in the Chicago Savings Bank Building is said to have been arrested by the Department of Registration and Education for practicing medicine without a license and to have been fined $25 and costs Staats was charged with treating cancers with a remedy which he says the United States government was very anxious to secure but for which it would not pay the price demanded by him

Faculty Appointments in Loyola—Dr Charles Louis Mix has been appointed professor and head of the department of medicine and Drs Milton Mandel and John M Lilly clinical professors of medicine in Loyola University School of Medicine Dr Edward L Moorhead has been appointed professor and head of the department of surgery, Dr William E Morgan professor of surgery and clinical surgery, Drs John F Golden and Charles F Sawyer clinical professors of surgery, Drs Michael F McGuire, George W Hochrein and Frank E Pierce assistant professors of surgery, Dr Philip H Kreuscher, clinical professor of orthopedic surgery, Dr George T Jordan, associate professor of diseases of the ear nose and throat, and Dr Walter McGuire, assistant professor of obstetrics

INDIANA

Sentenced Under Liquor Law—Dr Tell C Waltermire Shelbyville, is said to have been sentenced to the penal farm for thirty days and to have been fined $100 and costs for having intoxicating liquor in his possession

State Medical Board Appointments—The governor has named Dr Paul R Tindall Greensburg a member of the state board of registration and examination succeeding Dr Moses S Canfield Frankfort Dr William R Davidson Evansville to succeed Dr Solomon G Smelzer, Richmond and Dr Eldredge M Shanklin, Hammond to succeed Dr James M Dinnen, Fort Wayne——Dr William S Gott Crawfordsville, secretary of the board, has been reappointed a member

IOWA

Hospital Site Purchased—The North Iowa Lutheran Hospital Association has purchased a site comprising one-half block for St Luke's Hospital, Mason City the erection of which is to be undertaken in the near future

Health Board Reappointments—At the annual meeting of the state board of health held in Des Moines, July 22, announcement was made of the appointment of the following members to succeed others Drs Walter L Bierring, Des Moines, Charles S Grant Iowa City, and George F Sevens Centerville Dr Grant was elected president of the board

Iowa Medical Women Honored—Dr Jeannette F Throckmorton, Des Moines, read a paper before the Royal Society of Health and Hygiene in Brussels recently, on "Fashions and Public Health" Dr Throckmorton is state lecturer for Iowa and an officer in the U S Public Health Service reserve——King Alexander of Greece has conferred the order of King George the First on Dr Blanche Norton Eldon a member of the American Committee for Relief in the Near East who has been treating trachoma among Greek orphans in Anatolia

KANSAS

New County Society—Physicians of McPherson County met in McPherson July 30 and organized the McPherson County Medical Society electing Dr John C Hall McPherson president, and Dr Clinton R Lytle, McPherson, secretary treasurer

Personal—Dr John L Fryer chief surgeon of the Soldiers' Home Leavenworth, has been appointed governor and chief surgeon of the Soldiers Home Hot Springs S D Dr Arthur W Bartel has succeeded Dr Fryer as chief surgeon of the Soldiers' Home

Campaign for Funds—Business men of Rosedale have inaugurated a campaign to raise $32 000 to buy suitable land for administration building laboratories and lecture halls for the medical department of the University of Kansas The Kansas legislature appropriated $200 000 for a hospital building at Rosedale in 1919

State Tuberculosis Association Election—At the annual meeting of the Kansas State Tuberculosis Association Prof Frank Strong of the University Law Faculty was elected president, Dr Samuel J Crumbine secretary of the state board of health Topeka and Dr Lewis H Munn of Stormont Hospital Topeka were made vice presidents Dr Charles H Lerrigo registrar of the state bureau of vital statistics, Topeka was elected executive secretary and Dr Theodorse C Mueller treasurer

KENTUCKY

Society Reorganized—Oldham County Medical Society has been reorganized at LaGrange and Dr Stonewall J Stuck has been elected secretary

Personal—Dr Benjamin F Reynolds Carlisle has been elected full-time health officer of Mason County succeeding Dr J H Rise resigned to accept service with the state board of health Albany N Y——Dr Elwood Wand Woodbury, suffered a fracture of the rib and severe contusions recently when his car overturned near Bowling Green

Violation of Liquor Act—The state prohibition director is reported to have received from Prohibition Commissioner Kramer of Washington reservations to prohibit the sale of liquor on the prescriptions of three Louisville physicians Dr Deddo H W Borgman on account of his failure to keep a record of prescriptions and the abnormal number of prescriptions issued, Dr George F Dwyer who is said to have prescribed whisky to persons having no known ailment and Dr William M Dwyer who is said to have prescribed whisky in abnormal quantities and to have issued 2 000 whisky prescriptions in the first twenty days in March

LOUISIANA

Resigns from State Board—Dr Joseph T Abshire Kaplan for several years a member of the Louisiana State Board of Health, has resigned ill health and lack of time being assigned as the causes for this action

New Hospital in Mansfield—A modern hospital containing twenty one rooms and a separate department for colored patients has been opened in Mansfield by Drs Thomas J Fleming and Albert S Cooper

Leper Home Transfer Bill Passed—The federal government is now ready to purchase the leper home from the state for $35 000 The bill authorizing the sale having passed both houses of the general assembly At present eighty five patients are held in the institution

Fight on Tuberculosis—Tangipahoa Parish Anti Tuberculosis Society, which was organized recently at Amite will carry on a systematic campaign throughout the parish for educating the people regarding tuberculosis Prof W A Siseman was elected president and Mrs H P McClendon secretary of the society

MAINE

Personal—Dr George Holden Coombs Waldoboro has been appointed director of the division of venereal disease of the Maine State Department of Health succeeding Dr Harry E Hitchcock Auburn resigned

Bubonic Plague Warning—Dr L Everett D Bristol state commissioner of health Augusta has issued warnings to the seaport towns of Maine to protect themselves against the entrance of bubonic plague He emphasizes the need of rat campaigns not only in seaport towns but inland, and the rat proofing of buildings cellars docks etc

Health Association Purchases Exhibit—The Maine Public Health Association has purchased an excellent child welfare exhibit of posters which it will use throughout the state at fairs conventions churches and other public gatherings The exhibit consists of twenty series of colored posters illustrating child welfare subjects The exhibit and the supplementary lantern slides and lecture material are supplied by the state department of health free of charge Information concerning this exhibit may be obtained from W A Harris executive secretary of the association or from the Maine Department of Health

MASSACHUSETTS

Gift to Harvard Medical School—The Harvard University School of Medicine received a gift of $[illegible] from the Rockefeller Foundation for the development of psychiatry and $500 000 for the development of obstetrics and

F[illegible] On June 29, [illegible] Hospital [illegible] of Dr [illegible] enla[illegible] S[illegible]

for the day patients The boat leaves at 9 a m daily, returning at 4 30 p m

Personal—Dr Harlan W Angler, Gilbertville, has been appointed associate medical examiner for the Tenth Worcester District——Dr Daniel D Murphy, Amesbury, has been reappointed associate medical examiner for the Third Essex District——Dr Samuel H Calderwood, Boston, has been reappointed a member of the board of registration in medicine——Dr Albert S Hyman resident physician of the Long Island Hospital, resigned, August 1 to become superintendent of Mt Sinai Hospital Philadelphia At a dance given at Long Island, July 24, in honor of Dr Hyman, the officials of the institution presented him with a traveling bag

NEW YORK

Convalescent Camp for Wounded Soldiers—A farm of 2 000 acres near Towners, in Putnam County, has been donated by Mr and Mrs Chester W Chapin for use as a convalescent camp for worthy soldiers or sailors who have been gassed or wounded

Psychopathic Ward for State Reformatory—As a result of a riot and other troubles with the inmates of the State Reformatory for Women a psychopathic ward has been established at the institution under the supervision of Dr Meanas S Gregory and his assistants and nurses from Bellevue Hospital

Free Radium Treatment—The director of the State Institution for the Study of Malignant Diseases Buffalo announces that free radium treatment for sufferers from cancer will be administered beginning October 15 Any citizen of the United States will be treated free of charge but preference will be given to residents of New York state

Appropriations for Buffalo University Medical Deparment—During the past year the council of the University of Buffalo appropriated approximately $132,500 for the use of the medical department Of this amount $65 000 was subscribed by the medical alumni, $17 500 has been used to purchase property adjacent to the medical building $15 000 for improvements in the laboratories in the main building, and the balance is being used for the erection and equipment of new laboratories for chemistry, physiology and pharmacology

Soldiers Allowed to Stay at Saranac—A recent order from the U S Public Health Service directing the transfer of disabled men from the Home Sanatorium at Saranac Lake met with decided disfavor with the men Out of 210 men 200 voted to be permitted to remain The American Legion of New York State then recommended to the Surgeon-General that these men be permitted to remain and it has been assured by the Public Health Service that the order directing the transfer of tuberculous patients at the Home Sanatorium will not be enforced except in cases in which it is requested by the men concerned

Liner Brings Typhus—The French liner *La Savoie* which arrived from Havre August 2 had on board a case of typhus fever which developed during the trip The 217 steerage passengers were transferred to Hoffman Island for observation where two additional cases of typhus fever have developed These passengers are said to have been inspected by physicians of the U S Public Health Service at Havre The records of the health department show that in 1868 there were 157 deaths from typhus fever in New York City, in 1881 there were 612 cases and 163 deaths, in 1893 there were 473 cases with 200 deaths, in 1919 there were 12 cases with no deaths In recent years there have been only a few cases each year as a rule, among tenement house dwellers

New York City

Granted Honorary Degree—At its recent commencement exercises Yale University conferred the degree of Sc D on Dr William Darrach, dean of Columbia University College of Physicians and Surgeons for meritorious services performed during the World War and for his important publications in the field of scientific research

Personal—Dr Jacob Geiger has been appointed director of the New York Diagnostic Clinics and after a survey of the better American laboratories will reorganize the laboratories of this institution——Drs Simon Flexner and Alfred E Cohn, who have been attending the Red Cross Medical Conference at Geneva, arrived in this country on the *Adriatic* August 5

Enlighten Public on Benefits of Radium—Newspaper reporters were invited to attend the regular weekly radium clinic at the Post Graduate Hospital, August 6 The invitation explained that reporters were admitted not for the purpose of witnessing 'marvelous cures" but because the hospital feels "that it is not enough that the public should know that radium treatment is available It feels that the public should know how the treatment is made" It was further explained during the clinic that the hospital had come to realize that the interests of both the institution and the public could be best served by newspaper publicity The hospital is now negotiating for the purchase of 1 gm of radium

Fewer Cases of Sunstroke Under Prohibition—Officials of the health department state that one of the effects of prohibition is a decided decrease in the number of heat prostrations reported On the hottest day of this year, June 11, when the thermometer registered over 90 degrees there was only one heat prostration reported On May 5, 1919, with the temperature at 86 degrees four heat prostrations were reported and on June 3, 1919, when the mercury reached 91 degrees two deaths and eight heat prostrations were reported The ambulance board reports that in June, 1919, forty-nine cases of heat prostration were treated in the hospitals, while in June of this year only nineteen cases of this kind were so treated There appears to be less suffering from the heat in the poorer and more congested parts of the city It is suggested that this may mean that less money is spent for alcoholic beverages and more is expended for food, so that people are in better condition to withstand the heat

PENNSYLVANIA

Personal—Dr Clarence R Phillips Harrisburg, chief of the tuberculosis dispensary of the state department of health and for a number of years county medical director of Dauphin County has resigned

Fined for Unlawful Practice—In the case of the Commonwealth versus Mrs Hattie Shannon, Lock Haven charged with unlawfully prescribing medicine in Clinton County, the defendant is said to have entered a plea of guilty, July 22, and to have been fined $250 and costs, the total being $375

College Items—The campaign for funds conducted by the Woman's Medical College of Pennsylvania in January 1920, brought in something over $221 000 This included the endowment of nine undergraduate scholarships of $5 000 each a lectureship on nervous diseases and $32 000 for the endowment of a chair in preventive medicine in memory of Anna Howard Shaw The balance is to meet various hospital and college needs During the session 1919-1920 the U S Interdepartmental Social Hygiene Board granted $2 550 for assisting to maintain the salary budget in the department of hygiene This grant is increased to $4 050 for the session of 1920-1921——The Medical School of the University of Pennsylvania has received $50 000 by the will of Dr William C Goodell for the establishment of a chair of gynecology The University of Pennsylvania also received from the estate of Jane H Merrill deceased, the sum of $5 018 for the endowment of a scholarship in the medical school to be named the James Cush Merrill Scholarship in memory of her son——Jefferson Medical College has purchased for about $100,000 a plat of ground on which to erect a nurses' home in connection with the college hospital The property adjoining the college building has also been purchased for $30 000 and presented to the college as a gift A country convalescent home free of encumbrance and valued at about $20 000 has been deeded to the Jefferson Hospital This college has also received three gifts of $5 000 each of which the income of one is to be used for the orthopedic department and of the second for the department of pediatrics The third gift is to establish a scholarship in medicine

Philadelphia

Camp for Tuberculous Children—Health Director Furbush has asked for an appropriation of $4 000 to maintain the camp for tuberculous children at Chestnut Hill during the summer The camp has been in operation for a month and has at present in residence forty children aged from 3 to 10 years

Personal—Dr G Ernest Robinson and Dr John P Turner were elected associate chief surgeons of the Frederick Douglass Hospital July 30——Dr James P Sands has been provisionally appointed senior medical officer and Miss Mabel A M Bond occupational therapist, at the Philadelphia Hospital for Mental Diseases

Hospitals to Treat Ex-Service Men Free—Ninety-nine hospitals throughout the state are to cooperate in giving treatment to disabled ex-service men through arrangements planned by the Americanism Commission of the American

Legion The announcement of this plan to give medical aid free to members of the legion was made by Edgar F Baird State Americanism chairman Plans have also been made by the commission whereby care and attention will be given to service men who have been released from hospitals and sent home Interstate cooperation is to be practiced also to enable men discharged from medical institutions here to receive work and attention in other states

CANADA

Committees Formed to Combat Disease—Dr Gordon Bates Toronto, has returned from a month's trip through western Canada His visit was on behalf of the Canadian National Council for Combating Venereal Disease He attended the annual meeting in Vancouver and reports the organization of provincial committees in Manitoba Saskatchewan and Alberta, as well as at points in Ontario and Nova Scotia In Ontario committees have been organized at Toronto, Hamilton and Brantford

Personal—Dr Seymour Hadwin chief pathologist in charge of the biologic laboratory, health of animals department of agriculture, Ottawa, has resigned to accept a similar position in the reindeer investigations of the Bureau of Biological Survey U S Department of Agriculture with headquarters at Unalokleet, Alaska——Dr Alexander Primrose has been selected as the new dean of the faculty of medicine of the University of Toronto succeeding Dr C K Clarke, resigned

Drug Addicts in Canada Decreasing—Dr John A Amyot Toronto deputy minister of public health reports decided success in the efforts of the department of health to stamp out the opium evil in Canada The department has also been successful in breaking up several attempts to form an opium ring in the Dominion The opium and narcotic drug act, passed at the last session of Parliament, will be put into force about September 1 This act requires that all druggists, whether wholesale or retail and all manufacturers shall keep a record of their receipts together with a record of the quantity manufactured and a record of their sales

Canada's Work for Disabled Soldiers—The Department of Soldiers Civil Reestablishment has been giving medical services to all disabled soldiers of the Canadian and British forces resident in Canada or the United States Patients suffering from permanent disability or from recurrence of a disability incident to military service exsoldiers suffering from unpreventable illness within a year after discharge and men undergoing industrial training are the special beneficiaries of the department More than 7 500 patients are now receiving hospital services, approximately 1 850 of these being in tuberculosis hospitals and 770 in hospitals for mental diseases The department operates twenty-nine general hospitals, eleven tuberculosis sanatoriums and two mental hospitals and has definite arrangements with fifty-eight other hospitals and sanatoriums Up to Nov 1, 1919, more than 7,500 had received vocational training 19 125 were then in training, and more than 4,000 had been provided with artificial limbs

GENERAL

Gift for Medical Education—During the year, Mr John D Rockefeller gave an additional $20 000 000 to the general education board to be used in improving medical education in the United States, the income and principal to be distributed within the next fifty years

Fellowships for Negro Physicians—Six fellowships for negro physicians have been provided by Mr Julius Rosenwald of Chicago amounting to $1 200 each These are to pay the expenses of qualified negro students doing graduate work in the fundamental medical sciences

Demonstration of Antiplague Work—Antiplague work is being demonstrated by the U S Public Health Service in cooperation with state health authorities at Galveston Texas Surgeon-General Cumming and Assistant Surgeon-General McLaughlin were in attendance Health officers from all the gulf states were present

Gifts for Courses in Dietetics—The will of the late Capt Joseph Raphael de Lamar of New York provides that his residuary estate be equally divided among the medical schools of Harvard, Columbia and Johns Hopkins Universities these funds to be used for the study of dietetics and the advancement of preventive medicine

Prescription Blank Limitation Held Void—A ruling was made August 6 by Federal Judge Cochran at Lexington Ky holding void National Prohibition Commissioner Kramer's prescription blank limitation for physicians This decision will make it possible for a physician to issue practically an unlimited number of liquor prescriptions so long as he has a permit Means of revoking the permit, if the privileges are abused are provided by law

Venereal Disease Survey—Surveys have just been completed by the U S Public Health Service of medical legal, educational and general cooperative measures in force for combating venereal diseases in 444 of the larger cities of the United States Each community was graded on a basis of a possible 1 000 points In conducting the survey information was obtained in answer to approximately 300 questions regarding local conditions In a great majority of cities venereal diseases were alarmingly prevalent

Site Selected for Leprosarium.—The Public Health Service has recommended the acquisition by the United States government of the leprosarium at St Gabriels Miss At a recent session of the Mississippi legislature a bill was passed authorizing its transfer to the federal government Surgeon-General Cumming made an inspection of the property and found it well adapted for the treatment of leprosy There are at present 100 beds at St Gabriel Should the government take it over, however the capacity will have to be increased

Illegal Practitioners Exposed—Through the information collected at the headquarters of the American Medical Association the Council on Medical Education is in position to expose those practicing either in this country or abroad who may have illegally obtained diplomas from American medical schools One Victor Richard Ratten was found to be practicing at Hobart Tasmania on the basis of a diploma from the Harvey Medical College of Chicago which was shown to have been obtained in an irregular manner Information also collected exposed the illegal character of the diploma and license held by one Philip Dyment who was licensed in Georgia in 1914 and in California in 1915 Dyment's Georgia license was recently revoked and action against him is pending in California

Conference on Venereal Disease—The All-American Conference on Venereal Diseases under the joint auspices of the U S Interdepartmental Hygiene Board U S Public Health Service American Red Cross and American Social Hygiene Association will be held in Washington D C the second week in December This is the first of a series of regional conferences authorized by the International Health Conference held at Cannes France last year Representatives from the Western Hemisphere together with recognized authorities from Europe will attend the gathering with the object of reporting on comparing and evaluating present procedures for the control of venereal diseases The organization is in the hands of an administrative committee composed of four cooperating associations This committee consists of Dr Thomas A Story Dr C C Pearce Dr Livingston Farrand and Dr William F Snow

Bequests and Donations—The following bequests and donations have recently been announced

Mount Sinai Hospital New York City $5 000 Montefiore Home New York City $2 500 by the will of Samuel Hay

Homeopathic Medical Society of the County of Kings Brooklyn a donation of twenty city lots at Freeport Heights for the advancement of homeopathy in that section of the city by Dr and Mrs Otto H Rohde Brooklyn

Presbyterian Hospital Chicago Texas oil stock valued at more than $2 000 000 by the will of George B Harris Chicago

Home for Crippled Children Atlantic City N J $2 000 by the will of Elizabeth T Kenyon

National Stomach Hospital Philadelphia $5 000 and Methodist Hospital and Home for Incurables each $1 000 by the will of Mary J Kenyon

Jewish Hospital Philadelphia $2 000 by the will of Simon F Cohn

Southampton L I (N Y) Hospital about $40 000 the proceeds of a benefit

For the construction of a tuberculosis sanatorium at Ottawa in connection with the City of Ottawa Sanatorium a donation of $100 000 in Victory bonds by Mr and Mrs E C Whitney

National Sanatorium and Hospital for Sick Children Toronto Ont $500 each by the will of Alexander Patterson Toronto

LATIN AMERICA

Influenza Fund in Costa Rica—The government of Costa Rica has provided a fund of 50 000 colones (about $25 000) to combat epidemics of influenza

Retirement of Garcia Valenzuela—The professor of chemistry at the medical school at Santiago Chile Dr V Garcia Valenzuela presented his resignation and retired from the faculty this year

Prize for Work to Be Published by Medical Journal The *Revista Medica de Chile* published by the Sociedad

Medical Society, and an annual prize, to be called the Guzman Cortes prize, has been founded to be given for the best scientific work published in the *Revista* during the current year

Cuban Professors Go Abroad—Dr. Arturo Garcia Casariego, assistant professor of pathologic anatomy and histology of the School of Medicine of the University of Havana has been designated by the government to make a trip abroad to study matters relating to the teaching of these subjects.—Dr. Guillermo Diaz y Macias, professor of practical pharmacy, has also been commissioned by the Cuban government to study the organization of pharmacologic laboratories abroad

FOREIGN

Prize for Work on Hygiene—Dr. L. Muñoz of Madrid has been awarded the Garcia Faria prize of the Spanish Engineering Institute for his work entitled, "Sanitation and Hygienization of Spain"

No More Outings for Vienna Children—A Danish weekly states that owing to the scarcity of coal, the children's trains taking Vienna children to the Scandinavian countries have had to be discontinued, for the present, at least

Palestine Medical Association—The objects of the Palestine Medical Association are to strenghten and coordinate the medical forces of the country to collaborate with physicians outside Palestine to give the medical work a national as well as a humane value to prepare a native soil for Jewish scientists and to help in the creation of the Hebrew University

Medical Journal in Palestine—The first medical journal in Palestine has made its appearance. It is published quarterly by the Medical Association of Palestine and its first issue is dedicated to the memory of the Jewish physicians and nurses who laid down their lives during the years of upheaval in the Holy Land

Alvarenga Prize at Berlin—The topic for competing articles for this prize, in 1921, is the question whether lethargic encephalitis has a place apart by its etiology, clinical manifestations and pathologic anatomy. The award is 2,000 marks and the competing articles must be in the hands of the president of the Hufeland Society, Professor Umber, Kurfurstendamm 45, Berlin before April 1, 1921

International Congress of Comparative Pathology—The first congress of this kind was held at Paris in 1912, and the second meeting was appointed for Rome in 1914. The war caused its postponement but plans are now under way for the second congress to be held at Rome next spring. Prof. E. Perroncito of Turin is chairman of the committee of organization and the secretary is Dr. M. Levi della Vida of the Istituto d'igiene, Via Palermo 58, Rome

Cremation Before Death—Dr. Matsushita introduced a bill supported by twenty-three members of the Japanese diet which provides that bodies must be kept seventy-two hours after death before burial or cremation instead of twenty-four hours as the present law provides. He quoted a cremator from Kyoto who stated that he knew of six cases in which the supposed dead had screamed as the crematory fires reached them. The bill is strenuously opposed by Japanese physicians who state that this is absurd and a direct insult to their profession

The International Urological Society—The *Presse medicale* announces that the officers of this society have now been chosen, and the first meeting is to be held at Paris, July 7-9, 1921. The honorary presidents are Guyon of Paris and Watson of Boston, president H. Fenwick, London, vice presidents, Alessandri of Rome and Keyes, Jr., of New York, secretary Desnos, and treasurer Pasteau both of Paris. The committee in charge of the meeting is headed by Legueu of Paris. Verhoogen of Brussels and Brongersma of Amsterdam. The three questions to be discussed are nephritis with uremia, remote results of trauma of the urethra and pyelography

Proposed Reforms in the Medical Curriculum in Germany—Delegates from the different medical faculties in Germany met at Halle early in the year to confer on the reforms to be introduced in the teaching of medicine. The preliminary report of the proceedings is quoted in the *Munchener medizinische Wochenschrift*. A single standard of a twelve semester course is demanded. In teaching the natural sciences, five of the semesters to be devoted to preclinical studies. In teaching the special needs of the medical students shall be borne constantly in mind. The number of hours devoted to anatomy shall be less than at present but the two-semester course in anatomic dissection shall be retained. Before entering on the clinical studies, two months of test service in attendance on the sick shall be compulsory. During the clinical semesters, ten months of the vacations shall be devoted to practical training as assistant to a physician, *Zwangsfamulieren*. This can be arranged in hospitals and maternities where the chief is connected with a medical school. Examinations must be better managed so as to weed out incompetents. The foregoing requirements are now under discussion by the organized profession.

CORRECTION

Medical and Surgical History of the War—In THE JOURNAL July 24, page 255, is a brief statement about the Medical History of the War. This is substantially correct, with the exception of the list of authors of the different volumes, given in small type underneath the second paragraph. While the names of some of the members of this board are identical with the names of the prospective editors of the different volumes, the actual editors of some of the volumes (which will not be ready for the press inside of two or three years from date) have not yet been definitely determined. The manuscripts of the different volumes are in the hands of the present division chiefs of different sections in the Surgeon-General's Office but the shaping up of the material of these volumes for the press being a matter of time may fall into the hands of different persons from those listed.

Government Services

Chamberlain Succeeds Ashburn on Hygiene Board

Col. Weston P. Chamberlain, M. C. U. S. Army, has been appointed a member of the United States Interdepartmental Social Hygiene Board, succeeding Col. Percy M. Ashburn, M. C., U. S. Army, who has been ordered to a field command.

Army Medical Examinations

Announcement has been made that the results of the examinations of civilian physicians for entrance to the Army would not be available for several months. General Ireland says that returns in a considerable number of the examinations have already reached Washington and that the grades of the applicants were far above the average.

Arrangements for General Gorgas' Funeral

Arrangements for the funeral of the late Major-Gen. William C. Gorgas, Surgeon-General, U. S. Army, were announced August 6 by the War Department. On the arrival of the U. S. Army Transport *Pocahontas* at Hoboken the body was received with military honors and taken to Washington where a military escort conducted it to the Church of the Epiphany, 1317 G Street N.W. There it will lie in state until August 16 at 2:30 p. m. when the funeral services will be held. Interment will be in Arlington National Cemetery with full military honors. The grave of the former Surgeon-General will be near that of Major Walter Reed, who as an Army medical officer demonstrated the transmission of yellow fever by the stegomyia mosquito. It seemed most fitting to Army officials in charge of the arrangements that the remains of these two officers who achieved so much in the suppression of yellow fever should rest in close proximity.

Health Conditions in the Army

Malaria increased during the first six months of 1920 as shown by statistics collected at the Surgeon-General's Office. During the war, when intensive antimalaria cantonment work was being carried on there was a marked decrease in the admission rate for malaria as compared to the rate in the five years immediately prior to the war 1911-1915. But since the close of the war there has been another rise. The records show that many patients treated for malaria in the Army reclapse shortly after return to duty and the Surgeon-General points out that while quinin is rightly regarded as a specific in the treatment of malarial fevers, rest is an important adjunct in the cure of all acute cases.

An epidemic of paratyphoid fever has broken out at Hopewell, Va., a small community located just outside the boundaries of Camp Lee. Fear that the contagion might spread to the troops led to the dispatching of an Army medical officer to conduct an investigation.

Foreign Letters

MEXICO CITY

(From Our Regular Correspondent)

Aug 1, 1920

Plague and Yellow Fever

So far as plague is concerned, the improvement of conditions in Vera Cruz continues as only two new cases have been reported in the last two weeks From the beginning of the epidemic on April 19 to July 30, there have been fifty-six cases, with thirty-four deaths, at present four patients remain in the pest-house Some 50,000 persons have been vaccinated against plague and antirat measures are being carried out actively Among the many rats trapped, some were found infected by the plague bacillus During the last days however, none of the rodents examined have shown signs of plague infection The personal efforts and advice of Dr Carl Mitchell of the United States Public Health Service have been of great assistance in the antiplague campaign, and both the citizens and the public health authorities have expressed their thanks to him The newspapers have dwelt on the fact that the first shipment of antiplague vaccine received was taken to Vera Cruz from New Orleans by an American destroyer which showed the earnest desire of the American government to be of assistance

In Tampico a case of plague occurred which was discovered only after the patient s death Through the examination of the gland juice and the guinea-pig inoculation by Dr A Gochicoa of Tampico, it was ascertained that the case was of plague and the necessary measures were taken As several days have elapsed without any other cases being found and as no case of rat plague has been discovered, it is assumed that the patient went to Tampico from Vera Cruz and died In view of the thorough disinfection of his residence it is confidently expected that the disease will not spread in Tampico

Vera Cruz is now threatened by an epidemic of yellow fever, which had been absent for more than ten years According to newspaper reports several cases of 'black vomit' have occurred The permanent yellow fever service of Vera Cruz has received instructions to enforce thoroughly the isolation of patients, to investigate the presence in the patient s blood of Noguchi's leptospira in order to demonstrate Pfeiffer's phenomenon which would confirm the diagnosis according to Noguchi s view and also to test the curvative value attributed to neo-arsphenamin by Dr de Beaurepaire and other Brazilian physicians (THE JOURNAL Sept. 27, 1919 p 1020), which seems probable, yellow fever being a spirillar disease The Instituto Bacteriologico Nacional has been instructed to proceed with the preparation of a vaccine made from sterile cultures of leptospira This is feasible owing to Dr Noguchi s having presented the laboratory in his recent visit to Mexico with some culture tubes of the germ, which he isolated from patients in the city of Merida It would seem advisable that while the above mentioned laboratory studies are being carried out, Vera Cruz should be considered as yellow fever infected, and nonimmune persons should abstain from visiting that city or if they do so they should take all necessary precautions

Bacterial Vaccines Measured by Weight

In connection with the Vera Cruz epidemic, the city council of the City of Mexico requested Drs Cervera and Perrin to prepare in their private laboratories some plague vaccine Dr Perrin studied carefully the methods in use in different laboratories for measuring the dosage of the vaccine and decided to adopt the one used in the Instituto Oswaldo Cruz of Brazil, where antigens are measured by weight The vaccines delivered by Perrin to the city authorities are measured at the rate of 25 decimilligrams of bacterial bodies desiccated at 100 C, to each cubic centimeter This method is considered accurate and permits graduation of dosage in accordance with weight and other individual requirements of the patient

LONDON

July 24 1920

Immediate Disinfection in the Prevention of Venereal Disease

A deputation from the Society for the Prevention of Venereal Disease submitted to Dr Addison minister of health a resolution that as the ministry and public bodies have declined to provide the means of delayed disinfection against venereal disease at ablution centers he should instruct all pharmacists to sell such means of immediate disinfection as are approved by the ministry The society recommended that the ministry should take steps to educate the public in the hygiene of immediate self disinfection Dr J H Sequeira stated that the number of new male patients mostly ex soldiers suffering from syphilis treated at his clinic at the London Hospital in 1919 was 90 per cent more than the number treated in 1918 Sir Archdall Reid said that 40 000 men passed through his hands during the war and up to 1917 there was much syphilis A policy of immediate disinfection was then advocated among the troops the result of which was that venereal disease had virtually disappeared A limited number of public bodies have adopted the policy of the city

In replying Dr Addison said that they did not know whether venereal disease was increasing or not because there were no scientific data on the point They knew that there was a great increase in the patients attending the clinics To justify the ministry in issuing instructions to local authorities and to the public, and to avoid the conflict of opinion an overwhelming case would be necessary They would have to contend with a great wave of public feeling which would suggest that the government was encouraging vice The suggested policy might be successful if thoroughly and scientifically applied But they could not deal with a population of 40 millions on the same basis as that on which Sir Archdall Reid with iron discipline at his command could deal with 2 000 soldiers at one time That was quite different from placing something at the disposal of every citizen with instructions as to use To adopt the proposal of the council toward the population as a whole—boys and girls men and women—would be held he thought with material ground to encourage people to run risks Last year he appointed a strong body of men who reported to him that certain drugs if properly applied were efficacious but if not could not be relied on It also reported that their use would give a false sense of security and encourage the taking of risks In spite of the most careful instructions the issue of packets to soldiers was followed by infection in those who used them Two experimental centers for disinfection against venereal disease had been established under the Manchester corporation and so far the result was encouraging He was watching this experiment with anxiety The ministry would take any practical measure it could thoroughly recommend for the prevention and treatment of the disease and was quite prepared to certain of good results to face novel methods

A National Collection of Type Cultures

The Medical Research Council is about to establish a [illegible] house of bacteria for the use of research workers It is often difficult for them to obtain authentic strains" of various bacteria and protozoa The Lister Institute did much to

past from its own private collection, but British workers had often to depend on the courtesy of colleagues at home or abroad The Pasteur Institute in Paris, for example, had a collection maintained by M Binot Another collection, on a commercial basis, existed at Prague, from which city it has been transferred to the serophysiologic institute of Vienna In America the Museum of National History in New York has kept a culture bureau during the last eight years The new collection will be kept at the Lister Institute The scheme will be under the general direction, on behalf of the Medical Research Council, of Dr J C G Ledingham, a member of the staff of the Lister Institute, while Dr R St John Brooks and Miss M Rhodes have been appointed curator and assistant curator, respectively It is proposed to collect and maintain bacterial and protozoal strains of medical, veterinary and economic importance Subsidiary researches on the viability of bacteria in artificial mediums will be undertaken, the staff will also help in identifying strains received from workers at home and abroad Cultures will be supplied to workers at home or abroad a small charge being made to cover cost and postage It is already possible to supply the commoner types of human infection strains A catalogue will be prepared in due course

The War Collection at the Royal College of Surgeons

Progress is being made with the arrangement of the extensive war collection at the Royal College of Surgeons previously described in THE JOURNAL At present 2,689 specimens have been received Fifteen hundred have been made into preparations mounted, described and placed on exhibition Several hundred more have been examined and dissected and are awaiting the means of being displayed In its final form this magnificent collection which is to be housed at the college, will consist of 2000 wet preparations' illustrating the nature of wounds and diseases to which soldiers are liable under modern conditions of warfare, 300 dried preparations illustrating the character of bone injuries drawings made by artists of clinical and pathologic subjects, particularly those done by Mr A K Maxwell in France roentgenograms from military hospitals and casts models made at special hospitals Prof Arthur Keith Professor Shattock and Mr Beadles have handled and arranged this vast collection

Mr Barker Again

The attempt to obtain for Mr Barker the bonesetter a medical degree from the Archbishop of Canterbury by the exercise of an archaic privilege, has been criticized in a previous letter The archbishop, replying to a petition signed by more than 300 past and present members of Parliament, considers that such a degree would not be of any real value to Mr Barker and expresses a hope that some means may be found of marking the public appreciation of Mr Barker's eminent services to sufferers He adds that some of those who signed the petition were under the impression that by holding a Lambeth medical degree *honoris causa*, Mr Barker would become qualified to practice but that this is a mistake The degree does not give the right to register as a medical practitioner

The secretary of the memorialists is now of the opinion that a better and more adequate way of rewarding Mr Barker would be to procure for him a public title The lay press which leaves nothing to be desired in its efforts to boom Mr Barker now says that he is something far greater than the registered practitioner This reminds one of the story of a certain fox In an interview, Mr Barker said 'I am naturally disappointed at the decision not for my own sake, but for the cause of manipulative surgery I had hoped that the possession of the Lambeth Medical Degree might have invested me with the necessary official status to demonstrate my methods in the surgical schools of this country I firmly believe that the diffusion of a profounder knowledge of manipulative surgery throughout the profession would enable its members to cope far more effectively with many physical disabilities which are the cause of so much unrelieved misery today" This, to say the least, is rather curious, for although the press seems always to be fully at Mr Barker's disposal in advertising his marvelous skill," he has never at any time given the slightest inkling of his methods If he is so anxious to make them known, why does he not publish them? If he wants to demonstrate them there is nothing in the world to prevent him from doing so now If only out of curiosity he could easily get a large medical audience at any hall, but he evidently prefers silence Omne ignotum pro magnifico!

PARIS

(From Our Regular Correspondent)

July 23, 1920

International Congress of Surgery

The fifth International Congress of Surgery was formally opened, in Paris July 19, under the presidency of Dr W W Keen emeritus professor of surgery, Jefferson Medical College Philadelphia Dr Keen in his presidential address on Some Ideas Which Physicians Should Defend," spoke of the professional conscience maintaining that physicians were exercising a profession and not a trade When one works at a trade it is always possible to estimate the value of the services rendered, but the services of our profession can neither be weighed in a balance nor measured by figures We should always maintain our high ideals and we should not seek to obtain profit from our discoveries A new remedy, a novel fracture apparatus, an original method of suture and an innovation in treatment should be as free to all as the air we breathe A fracture apparatus invented in Philadelphia should be free to be employed in Paris or Tokyo, on the Cape or in Buenos Aires A new remedy should be available to physicians and patients in all parts of the world Whether the patient be in Philadelphia, Paris or London, he should not be denied, even for a single day, the benefit of any measure which may ward off death or invalidism But what was particularly interesting in Dr Keen's address was his account of the results obtained in the United States in the campaigns against venereal diseases and alcoholism Speaking of prohibition, he said that despite the short period of time which has elapsed since it went into effect, the movement has brought appreciable results To be sure, private stocks are not yet exhausted the measures of enforcing the act are still defective and those people who are willing to buy alcohol even at the very high prices now prevailing have no difficulty in obtaining a supply The arguments which can be drawn from the results obtained so far are nothing if not convincing Dr Keen quoted the experience in five large hospitals and a large municipal lodging house of New York in the latter the admissions during the first two months of 1919 numbered 22350, during the same months in 1920 under prohibition these figures dropped to 4,607 In Philadelphia, the house of correction, which before the days of prohibition harbored more than 2000 vagabonds and drunkards, has had an average population of from 400 to 500 since the prohibition act went into effect During the first four months of 1920 the savings realized as a result of the decreased number of employees and the accompanying reduction in expenditures for wages, food and other expenses were enough to meet all the outlays for public charity during the balance of the year In the first half of 1919 when alcohol was freely obtainable there were 17,114 arrests for drunkenness in Philadelphia under war prohibition this number dropped to 6509 in the following six months, a decrease of

62 per cent Dr Keen concluded that experiences on a scale such as that furnished by millions of human beings in the United States and in Russia during the first years of the war are absolutely decisive Among a people where total abstinence is practiced there is less drunkenness, less crime, less disease, fewer accidents less expense to city and state Under these conditions, is it not our duty, considering ourselves as a corporation, to conduct an active campaign in favor of absolute prohibition, thereby bringing to pass the resultant happy consequences from the point of view of health and public welfare?

Opposition to Free School Books

Under the law of June 16, 1881, primary public instruction in France is free, and although this does not apply to the accessories of education, such as books, copy books, etc., the municipal councils of most of the large cities have extended it to include these school supplies by voting special appropriations for the purpose Dr L Meyer, medical inspector of schools, recently called attention to the dangers which are entailed by free distribution of school books From the standpoint of hygiene alone it may be readily conceived that books which pass from hand to hand and which are carried by the pupils to their homes in fact, almost everywhere, may harbor great numbers of micro-organisms Dr Meyer suggested as a solution that at the beginning of the school year the parents pay the price of the books and these will then become their property

League of Red Cross Societies

The medical council of the League of Red Cross Societies, of which Drs Roux and Calmette of the Pasteur Institute of Paris are members has just terminated its work in Geneva Among the suggestions adopted by the council the following are worthy of note a recommendation to continue support of the league's campaign against typhus and other contagious diseases, grants and subsidies to laboratories, the creation of child welfare centers and continuance of researches on rickets, organization of an intensive campaign against venereal diseases by regional conferences and scientific and moral propaganda, the establishment of numerous tuberculosis dispensaries, open air schools and sanatoriums The council approved in addition, the antimalarial war in Spain the public health program and investigations in Roumania and Slovakia, it recommended complete international registration of vital statistics by uniform methods and last, the inception of an international journal of public health to serve as a special medium for medicine and hygiene

Death of Professor Guyon

Dr Felix Guyon formerly professor of the Paris medical faculty, has just died at the age of 89 He was born at Saint Denis (Reunion Island), July 21, 1831 studied at the Nantes school of medicine and graduated M D at Paris in 1858 He received the nomination of physician of Paris hospitals in 1862 and of professor agrege in the following year In 1867, Dr Guyon became a member of the staff of Necker Hospital and retained this position until his retirement In 1877 he was made professor of surgical pathology resigning from this chair in 1890 to assume the newly created chair in clinical urology in which he expounded the remarkable teachings that made him known throughout the medical world Professor Guyon joined the Academie de medecine in 1878 and in 1892 he was elected a member of the Academie des sciences Professor Guyon was the author of numerous medical works the best known of which are his clinical lectures and his atlas on diseases of the urinary organs and his clinical lectures on surgical diseases of the bladder and prostate gland

BERLIN

(From Our Regular Correspondent)

July 5 1920

The Infant Mortality Rate

During the war and the revolution the public health was greatly affected The infant mortality rate remained within moderate bounds in the first years of the war being 16 4 15 4 13 6 and 15 5 per cent in 1914 1915 1916 and 1917, respectively, for all Germany Scarlatina diphtheria and typhoid fever were widespread while cholera and typhus were moderately prevalent As early as 1916 the mortality rate of tuberculosis in the civil population showed a considerable increase In Prussia for instance the number of deaths from tuberculosis in women rose from 25 000 in 1914 to 30 000 in 1916, this increase was further augmented in 1917 when 39 000 women died of the disease In Leipzig the tuberculosis mortality rate was 91 6 per cent higher in 1918 than in 1914 A frightful increase occurred in the mortality rate of children in 1917, the increase as compared to the rate for 1913 being 2 4 per cent in infants 49 3 per cent in children aged 2 to 6 and 50 per cent in children aged 6 to 15 in round numbers 50 000 more deaths occurred in children under 15 years of age

Tuberculosis

To counteract the increase of tuberculosis a national tuberculosis act is contemplated for which Professor Kayserling makes the following basic demands 1 The apprehension by means of compulsory notification of all tuberculous patients who may possibly become sources of dissemination, in the first instance all those having an infectious form of pulmonary tuberculosis 2 Establishment of public dispensary clinics where all cases of tuberculosis are to be reported 3 Provision of free sanatorium and domiciliary treatment for all patients with advanced pulmonary tuberculosis who endanger their surroundings 4 Elimination of all infectious tuberculous workmen from industries in which they come in constant contact with children 5 General stipulations regarding the necessary preventive measures in industrial and community life It should be stated that some specialists in public hygiene took certain exceptions to these demands, but the draft of the law has not yet been completed

Venereal Diseases

After the revolution discipline was relaxed and many soldiers infected with venereal diseases escaped from supervision As a natural consequence venereal diseases which had been uncommonly prevalent during the war increased considerably The diagnostic clinics established by the national insurance institutes in 1916 wrought beneficent results by furnishing expert advice to venereal patients free of charge By February 1919 the number of these diagnostic clinics had grown to 125 The important position which this system of supervision and care of venereal diseases had attained may be sensed by the number of patients at the clinics these increased from 4 939 in 1916 to 19 140 in 1917 and 33 000 in 1918 Treatment is generally precluded at these clinics in conformity with the wishes of the great majority of physicians for it was feared that this would deter men from seeking advice Anxiety over a possible decline in the private practice of physicians played a subordinate role Despite the success of the clinics it is considered imperative that venereal diseases be fought in more intensive fashion by national legislation A measure which was recently introduced in the lower house contains the following essential stipulations

Syphilis gonorrhea and chancre are considered venereal diseases in the sense of this act and every infected person who with any of these diseases is compelled to seek medical

ment by a registered physician Parents and guardians are in duty bound to furnish medical care to their infected wards The proper authorities may force persons who are seriously suspected of disseminating the disease to submit to examination at the hands of an authorized physician, to produce a certificate of health, and if conditions warrant, to adopt measures of treatment Any one who despite knowledge of his infection takes an opportunity to transmit his disease is liable to imprisonment for as much as three years, or to more severe punishment, if circumstances warrant The prosecution of married and affianced individuals will be undertaken only on the initiative of the injured party Only physicians registered in Germany are permitted to treat venereal and genital diseases, absent treatment is positively prohibited Quacks who advertise publicly in print, by illustrations or exhibitions, even in veiled form, are liable to punishment, the same with physicians who tender their services in a sordid manner Physicians are in duty bound to instruct their patients regarding the nature and infectiousness of the disease and to furnish an official memorandum If the patient discontinues treatment or his occupational or personal relations prove to be particularly dangerous to others, he may be reported by the physician of a diagnostic clinic Public clinics must be established throughout the country in accordance with definite regulations to be issued later Public health officials and employees are enjoined to secrecy The advertising of remedies, apparatus and methods of treatment of venereal diseases except to physicians, druggists or authorized trade channels or in professional medical and pharmaceutic journals, is a punishable offense Specially severe penal regulations are prescribed for the protection of children against infection by wetnurses, and vice versa The exhibit and advertising of articles for the prevention of venereal disease, provided this is not done in a manner offensive to morals and decency, are permissible

The great majority of physicians are opposed to compulsory notification of venereal diseases The Berlin dermatologic society, while opposing compulsory notification, thinks it is necessary to give physicians the right to make a suitable report in cases in which there is great danger of transmission of the disease, and this attitude has been adopted by the Berlin medical society and other professional organizations Naturally, the endeavor to dam the sources of venereal diseases by rigid regulation of prostitution plays an important role in the campaign The Deutsche Gesellschaft zur Bekampfung der Geschlechtskrankheiten recommended in 1918 that all regulations and orders regarding certain women under control of the morality police be repealed and that the morality police be converted into a purely social and sanitary office

Public Health Activities in the New Government

In public health organization the revolution produced complete innovation, especially in Prussia, where the medical section of the Prussian ministry was transferred to the new ministry of social welfare The sphere of activity of this ministry, which was formed from parts of five other ministries, is divided into three divisions namely social welfare housing and colonization and child welfare The division of social welfare has taken over all the duties of the old medical section especially the sanitary police bath police prostitution police, food inspection medical matriculation examinations (formerly under the ministry of education) sanitary inspection of university clinics and hospitals occupational hygiene, public food supply (medical phases) veterinary inspection, hygiene of mining and transportation The government refused to grant the request of many physicians to establish a Prussian ministry of health with a physician at its head, and the same is true of a national ministry The new ministry of labor has reorganized the section of medical charities and hospitals, which is designed to serve especially for disabled soldiers, more particularly in settling pension claims For this purpose twenty-five general and 360 local districts have been established, and these require the services of about 1,100 physicians Many of the extant hospitals have been converted into national hospitals, and, on the average, four of these are to be found in each general district The professional personnel of the service receives advanced training in medicine at the Kaiser-Wilhelms Akademie für ärztlich-soziales Fursorgewesen, formerly the army medical school

July 16, 1920

The Public Hospital Bill in Austria

The Austrian 'National Convention" which represents our parliament at present, is busy with what is termed the 'Hospital and Medical Bill" Among the paragraphs of general interest apart from those pertaining to the administration and financial reconstruction of these institutions, the following are noteworthy A patient cannot be operated on without his verbal or, in certain cases written consent If he is under 18 years of age his legal representative—parent, relative or legitimate guardian—must give his consent If the operation is of such a nature that its postponement would be dangerous to the life of the patient, the operation may be performed without the formal consent The chief surgeon of the ward or of the institute decides as to the necessity of such an urgent operation and is responsible for his decision A postmortem examination on patients who die while under treatment in a hospital will be performed except when a contrary decision is especially expressed by the family of the patient or by himself during his lifetime But such a wish cannot be complied with in cases of obscure or uncertain diagnosis, or when it is necessary owing to an operation s having been performed, naturally necropsies for forensic or sanitary reasons do not fall under this paragraph These will be performed without paying attention to any other wishes Two resolutions were passed by the committee studying the bill as an amendment to it The government is advised to find some means for enabling the medical staff and the nurses to be paid at a rate appropriate to the rise of prices and secondly to find means for the equipment of all Austrian medical schools in such a way that these institutions will flourish and fulfil their aim as places of modern clinical teaching for the benefit of suffering mankind Furthermore a suggestion has been made that the necessity of a health certificate should be incorporated in the bill This would require that, before entering into matrimony each partner of the intended marriage should produce a certificate of health, issued by the magistrates of the usual place of habitation of the party Magistrates would be obliged to keep a record of the health of every inhabitant so far as reported to them by hospitals and physicians in cases of infectious diseases, including syphilis, gonorrhea and tuberculosis as well as mental diseases The technic of these notifications which should be made also to the magistrates of the birthplace of the party and the best and most efficacious way, is now under discussion The severe drawback of such a procedure consists in the possible refusal of patients to consult medical men or hospitals with the resulting danger to public health, if they fear that their ailments may become known to strangers or to a possible matrimonial partner

The Problem of "Restoration of Youth"

Widespread discussion of a scientific publication by Professor Steinach of the Vienna Biologic Institute arose

recently in the lay press This investigator, who has been working on the problem offered by the internal secretion of the sexual glands, reported his success in restoring old male rats to juvenile strength, function and appearance by ligation of the testicular duct of one side, thus causing hypertrophy of the interstitial tissue of the testicle, while the glandular structure of the testicle atrophied Professor Steinach claims that this interstitial stroma is a special organ having specific function like the stroma of the suprarenals He calls it the puberty gland and asserts that the stroma of the ovary has an identical function in the female This puberty gland by its internal secretion produces the specific sexual differentiation of the male and the female This experiment on animals, which it is claimed, has been corroborated by competent investigators, enabled him for instance to change at will the sex of juvenile individuals, he could also 'revive" the generative power of old rats, and acting on his suggestion Dr Lichtenstern a surgeon in this city, has performed the operation on three men who had become old and weak, and whose entire appearance as well as mental condition has since then improved in a most marked way In females, application of appropriate doses of roentgen rays seems to have a similar action, and the beneficial results obtained after some operations, like the ligation of the oviduct or the roentgen-ray treatment of tumors of the adnexa, hitherto not quite open for explanation, seem to deserve to be viewed from a different standpoint as regards the etiology Dr Steinach has also exposed the testicles to roentgen rays This procedure likewise seems to stimulate markedly the puberty gland After the publication of this paper, the widespread interest soon became annoying to its scientific author It was regarded as a 'sensation," and earnest requests by scientists to the lay press were necessary to stop lay comments and to commit the problem to medical hands, where it really belonged One result of the publicity of the method has been most grateful Under the impression of the importance of further investigations in this line, an appeal was made by our leading daily paper to collect funds for the biologic institute where Steinach is working, and this appeal was seconded by Professor Roux Money is coming to both for this purpose

Measures Against Abuse of Hospital Treatment

The organization of the medical profession has turned the attention of directors of our public hospitals, as well as the chiefs of such hospital departments to the fact that a large number of patients enjoying the advantages of hospitals or outpatient departments (ambulatories, dispensaries, etc) are in reality not entitled to these benefits Such institutes are intended in the first place for persons unable to pay for treatment, and in the second place for cases not suited to home treatment when the patients are able to pay for it Therefore the organization earnestly urges all persons in a position to control the working of the institutes to refuse admission to all patients in a position to pay for treatment or belonging to state or municipal or private corporations The latter should be treated by the physician appointed for them Only in cases of emergency, as casualties, accidents or riots should such persons be allowed to turn to hospitals or ambulatories Since nowadays each patient costs the hospital a sum varying between 65 and 150 kronen a day and the technical and chemical appliances and apparatus are so very expensive even the treatment in outpatient departments if the patients do not pay for it, is a severe burden on the funds of the institutes At the same time if members of corporations friendly societies, sick clubs and the like will not be admitted free of charge but have to pay like private patients these corporations will find it more convenient to appoint physicians and specialists for their members, thus giving the profession again the possibility of earning a decent living for decent work A severe drawback and a source of constant dissatisfaction among the profession working in our towns was the custom of country practitioners to send their patients requiring special treatment not to a specialist but to a town hospital These cases were always lost to the private physician The organization has caused a list of all recognized specialists to be circulated among all the practitioners of the country, with full details so that they will be in a position to direct the patient to the proper man with benefit to the physician, the specialist and the patient alike

"Socialization" of the Drug Business

The government has definitely decided to take over all the drugstores and apothecary shops existing in this country and has convocated a committee of experts for the purpose of working out the methods best suited for this aim For a long time public feeling was very adverse to the apothecary shops, because of the high prices of medicines they charged and of the alleged enormous profits thus obtained by these tradesmen to the disadvantage of the ill In spite of the rapid rise of prices of drugs and the chemical constituents of all remedies which in nearly all instances have to be imported from abroad the public found that it was charged too high prices The socialistic influence in the government is still sufficiently strong at least to brag about the desire to improve the matter and it has been decided that within a year all apothecary shops may be bought by the state The owner will receive a compensation amounting to a sum varying between fifteen and twenty times the net profits, the last five years being taken as an average Every apothecary desiring to retire must offer his business to the state and no new license will be granted to private apothecaries Thus, within a certain number of years all private owners will die out so to speak and the whole trade will be owned by the state Then these stores will be run for the state and it is believed that the articles necessary for treatment of patients including the drugs will be cheaper for the public than at present But men in a position to know assert that the government management will result in much higher prices than are in force at present Also the few wholesale drug stores and drug factories existing in this country will be turned over to the state within a reasonable time Already the state controls the trade with alkaloids alcohol and certain chemical substances used in technical process In the near future the alcohol chemical trade will be socialized"

Decreased Population in Austria

The last census of this country's population, taken Dec 31 1919 shows that there were 6 320 000 souls living in Austria on that date or 348 000 less than before the war Vienna itself has lost nearly 200 000 having now 1 810 000 all other towns with the exception of one—the industrial center of the coal and iron mines district—show similar losses of between 5 and 10 per cent of the population The agricultural districts show partly no change partly a slight increase The sex proportion is 53 per cent females and 47 per cent males against 51 and 49 per cent respectively in 1913 The differences against prewar times are not due entirely to the mortality caused by the war as the large emigration is also responsible for the loss because the economic conditions of our mutilated country have prompted many firms and corporations and private persons to shift their occupations and abodes to the neighboring countries The census shows that the number of children between 1 and 6 years diminished by approximately 34 per cent This the prospects for the rebuilding of the country are seen not very encouraging

Marriages

FRANCIS C HERTZOG, Lieut, M C, U S Navy, to Miss Aldie Sundre, of Staten Island, N Y, at Norfolk, Va, recently

JAMES S SIMMONS, Major, M C, U S Army, to Miss Blanche Scott of Graham, N C, at Honolulu, Hawaii, June 29

CHARLES R APPLEGATE Indiana Harbor Ind, to Miss Bertha Mitchell, of Indianapolis, at Highland Park Ill, July 28

NICHOLAS FRANCIS BRECKER, Philadelphia to Miss Mary Holland of Doylestown, Pa, at Pottsville, Pa, July 20

HENRY WALKER DECKER, Lahore Va to Miss Florence Fraser Boston of Warrenton, Va, June 15

ZACK PERRY MITCHELL, Coleraın N C, to Miss Ella Whitlock Taliaferro of Richmond Va, June 9

ERNEST R BROCKING, Indianapolis to Miss Minnie Boyle of Greensburg Ind, in St Louis, July 20

ARMAND GOLDSMITH MCHENRY to Miss Irma Russ both of Monroe, La, in New Orleans July 14

CHARLES ELROY LLEWELLYN Richmond, Va to Miss Pearl Ann Shields of Hampton Va June 12

RICHARD WINGFIELD VAUGHAN to Miss Marguerite Stoltz both of Richmond, Va June 19

WILLIAM SCARFF WILEY to Miss Susan Elizabeth Brown, both of Bristol Va June 24

BERNARD HEWITT KYLE, to Miss Putnam Watkins both of Lynchburg Va, June 16

JACOB PILLER, Paterson N J, to Miss Miriam Liebschutz of New York July 1

CECIL R RIGBY Spartansburg S C to Dr Hallie M Clark, of Baltimore July 26

DABNEY KERR to Miss Eleanor Smith both of Catonsville, Md, August

Deaths

John Henry Carstens ⊕ the well known surgeon and gynecologist of Detroit aged 72 died August 7 from malignant disease after an illness of several months Dr Carstens was born in Kiel Germany and came to America with his parents after the revolution in 1848 He was graduated from Detroit Medical College in 1870 and practiced in Detroit since that time He had been president of the Wayne County Medical Society, the Mississippi Valley Medical Association and the American Association of Obstetricians and Gynecologists. He had been a teacher almost all his professional life lecturing first on minor surgery diseases of the skin and clinical medicine and after running almost the entire gamut of medical teaching served for several years as president of the faculty and professor of abdominal and pelvic surgery in the Detroit College of Medicine He was chief of staff of the Harper Hospital and consulting obstetrician to the Woman's Hospital and the House of Providence Dr Carstens was a good citizen and a man of strong belief in the obligation of public officials to their constituencies He was chairman of the Republican city committee in 1879 and had served also on the board of education and the board of health He was a prolific writer in the fields of gynecology and surgery In Dr Carstens death not only Michigan but the entire country loses one of its most respected and influential leaders in scientific medicine and surgery

Walter H Kirkpatrick, Haven Kan, University Medical College of Kansas City Mo 1908 aged 39 Lieutenant Kan N G, during the World War, discharged May 26 1919 while swimming at a summer resort near Boston recently, died from acute dilatation of the heart

Charles Henry Struble, Dayton Ky Pulte Medical College Cincinnati 1895 aged 47 a member of the Kentucky State Medical Association, Captain M C, U S Army discharged Dec 26 1918 died July 19 after a surgical operation

William A Cracraft, Wheeling W Va (license West Virginia State Board of Health years of practice 1881), aged 76, a practitioner for fifty-three years a Confederate veteran, died in Elm Grove, Wheeling July 22

Charles Duncan Ferguson, Oklahoma Okla, University of Toronto Ont 1901, aged 45, a specialist in diseases of the eye, ear nose and throat, died in Corpus Christi, Texas, June 11 from ruptured aneurysm of the aorta

Thaddeus McLaughlin, Springfield Ohio, Eclectic Medical Institute Cincinnati 1904, aged 42 a member of the Ohio State Medical Association, died, July 24, from a self inflicted wound of the throat

Joseph M Wolfe, Hugo Okla, Memphis (Tenn) Hospital Medical College 1895 aged 59 a member of the State Medical Association of Texas died, July 8 from chronic interstitial nephritis

Van Hurlburt Wilcox, Minneapolis, University of Minnesota Minneapolis 1902, aged 48 a member of the Minnesota State Medical Association, Captain M C, U S Army, died July 20

Ivan Wodrow McDowell, Jr ⊕ Savannah Ga, Medical College of Virginia Richmond, 1908 aged 34, Lieutenant, M C U S N R F died in a hospital in Asheville, N C, July 30

William Sayers Duff, Fort Payne Ala, University of Alabama Mobile 1889 aged 59 a member of the Medical Association of the State of Alabama died July 26, from septicemia

John George Stiefel ⊕ Baltimore, College of Physicians and Surgeons Baltimore 1901 aged 46, a member of the faculty of his alma mater, died July 26 from heart disease

Charles Wesley Baker, Kilgore Ohio College Columbus Ohio 1898, aged 47 Starling Medical grade crossing accident near Denison Ohio was killed in a

Martin Luther Tisdale, Tampa Fla University of Alabama Mobile 1907 aged 39, a member of the Florida Medical Association died July 22 from cerebral hemorrhage

Darsey L Coffindaffer ⊕ Shinston W Va, Medical College of Virginia Richmond 1909 aged 38 was killed in a grade crossing accident at Fairmont W Va July 21

Lewis Prichard, Charleston W Va, University of Michigan Ann Arbor 1867 Bellevue Hospital Medical College, 1876 aged 81, died July 21 from senile debility

Israel Hill, Peggs Okla, University of Arkansas Little Rock a member of the Oklahoma State Medical Association, 1898 aged 61 was killed in a cyclone May 2

David H Thomas, Columbus Ohio College of Physicians and Surgeons Baltimore 1895, aged 52, a coal operator, died July 20 from diabetes

T S Wadsworth, Morgan Utah, College of Physicians and Surgeons Keokuk Iowa 1877, aged 86, died May 1, from cerebral hemorrhage

James Thomas Tonks, Lyme Conn, Eclectic Medical College of the City of New York 1892, aged 67, died in a hospital in Boston July 22

John Biebinger, Indianapolis (license Indiana State Board of Medical Examiners 1897), aged 66, died, May 15, from carcinoma of the liver

Benjamin Franklin Landes, Burlington Ind Eclectic Medical Institute Cincinnati 1879, aged 66, died July 22 from valvular heart disease

George R Harnden, Stillwater Okla, Chicago Homeopathic Medical College 1885, aged 81, died, May 25 from arteriosclerosis

James Lee Herrod, Cabot Ark (license State Medical Board Arkansas 1903), aged 85 a Confederate veteran, died July 22

Felix B Linder, Oxford Miss, Memphis (Tenn) Hospital Medical College 1883, aged 64, died July 6, from cerebral hemorrhage

Robert B Jenks, Yonkers N Y, New York Homeopathic Medical College 1868 aged 75, died July 18 from heart disease

Thomas H B Schooling, Green Castle Mo, College of Physicians and Surgeons Keokuk Iowa 1874, aged 80, died, July 27

Henry Furtney, Orosi Calif College of Physicians and Surgeons Keokuk Iowa 1888 aged 63, died about July 19

Correction.—The notice of the death of Dr Milton S Hopper Gary Ind which appeared in THE JOURNAL of July 24 page 36 is incorrect Dr Hopper writes that he is in good health

⊕ Indicates Fellow of the American Medical Association

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

THE BETHLEHEM LABORATORIES, INC, PREFERRED STOCK

Physicians in various parts of the country have sent in to THE JOURNAL batches of material they have received from the Bethlehem Laboratories, Inc, New York City This concern tells the physician that he has been selected as one of two leading physicians" in his community as entitled 'to an opportunity to share in the profits of our Company" The physician is told further that the Bethlehem Laboratories, Inc 'control the manufacture of Hyclorite" which he is reminded 'has been accepted by the Council on Pharmacy and Chemistry of the American Medical Association" Further, the Bethlehem Laboratories Inc, realizing that the medical profession will be "a great factor in spreading the ethical message of Hyclorite" invites the physician "to share in the profits" of the company With this in mind the Bethlehem Laboratories state that they "have decided to allow one thousand of the leading physicians a three-day option to purchase four shares of the 8% Cumulative Preferred stock $400 00"

Accompanying this letter is a very gaudy 'Stock Subscription Warrant printed in the approved 'gold certificate" orange-colored ink It certifies that the recipient—whose name is filled in—is "entitled to subscribe for FOUR shares of the 8% Preferred Stock of the Bethlehem Laboratories Inc ' by surrendering the "warrant' on or before Aug 1 1920—and paying four hundred dollars! One curious point, which may or may not be significant, is noticed in reference to these 'warrants" All those that THE JOURNAL has received were sent out July 24, 1920, and each warrant" bears a serial number Only one thousand leading physicians," it will be remembered were offered this 'three day option" Yet, the serial numbers of all except one of the 'Stock Subscription Warrants" sent to THE JOURNAL are considerably over one thousand, in fact the numbers on some of the warrants" were well up toward four thousand!

The concern gives a list of the men composing the "directorate of the Bethlehem Laboratories Inc" The chairman of the board of directors and the president of the corporation is a real estate operator of Bethlehem, Pa Its secretary is the cashier of one of the Bethlehem banks Two other men on the directorate are respectively, president and cashier of another Bethlehem bank Another member seems to be in the steel business in Bethlehem Still another is described as a Bethlehem 'capitalist ' The president of the General Laboratories Madison, Wis is yet another member of the board of directors The remaining two men of the board are alleged to be physicians One of them is a Prominent Physician' of Bethlehem Pa and the other is Dr J Jay Reilly, Philadelphia, Prominent Philadelphia Surgeon and Consulting Chemist to several large manufacturing drug concerns' One would suppose that the Biographical Department of the American Medical Association which collects official data on all the physicians of the United States and its possessions would have some data regarding a Prominent Philadelphia Surgeon and Consulting Chemist to several large manufacturing drug concerns' Yet curiously enough no such individual can be found either in the American Medical Directory or in the latest directory of the American Chemical Society

Hyclorite was accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies because at the time it was considered it was marketed in accordance with the Council's rules We know no thing about the Bethlehem Laboratories Inc other than what has been stated, nor do we know whether there is any truth in the claim that this concern controls the manufacture of Hyclorite' As for the investment proposition which the Bethlehem Laboratories Inc makes to physicians it is an insult to decent medical men THE JOURNAL has repeatedly pointed out that when physicians are financially interested in the products they prescribe for or recommend to the sick the public is not getting a square deal The composition and medicinal value of therapeutic agents are not the only factors for the medical profession to take into account, the methods of exploitation may be just as important It is against public interest and a degradation of scientific medicine for physicians to be financially interested in the products they prescribe

Correspondence

CONDITIONS IN THE INDIAN MEDICAL SERVICE

To the Editor —I have recently had occasion to give extended consideration to the medical needs of our native Indian population I visited a number of reservations in continuation of former inquiries including this time the Zuni and Navaho reservations of Arizona and certain Pueblos of New Mexico In my judgment the medical situation is as deplorable as it is disgraceful and I am satisfied that if the facts were known and thoroughly understood the organized medical profession, through the American Medical Association would bring pressure to bear on the government to bring about the required drastic and far-reaching reforms

The matter is apparently one of indifference to the Commissioner of Indian Affairs who had every opportunity of presenting *all* the facts precisely and emphatically in his evidence before the Congressional Committee of Inquiry That evidence does not include as it should, a complete statement of expenditures on account of the Indian Medical Service and all that is properly connected therewith Attention is not drawn to the lamentable underpayment of physicians and nurses on Indian reservations and the total inadequacy of the medical and nursing staff considering the normal needs of the Indian population We are under treaty or humane obligations to the Indian tribes under the control of the Indian office to provide adequate medical assistance but broadly speaking in the case of at least all of the larger reservations such assistance consists of a single physician with possibly a small hospital insufficient to provide proper care or equipped with an insufficient staff of nurses and other help required for the needs of the patients There are no pharmacists connected with the Indian medical service although it is now held and recognized that physicians should not be expected to do their own dispensing or compounding except in cases of emergency

There is no adequate dental service the total number of dentists being less than ten who travel from place to place over an area of vast extent There is no adequate provision for eye specialists although the Indian population is terribly afflicted with trachoma introduced from the outside largely because of negligence and indifference to the risk of infection

In Serial No 6 of the Hearings of the Committee of Indian Affairs is a table which may well bring the blush of shame to a government under obligations to provide a proper Indian medical service and in duty bound to afford those who are rendering such service a means of maintaining a proper standard of life According to this statement of the entire staff of physicians other than the chief medical supervisor who receives a salary of $3000 a year only one physician receives a salary of as much as $1,800 four of $1,600 one of $1,500 twenty two of $1,400 ten of $1,300 and seven over $1,200!

The total number of regular physicians in the service, Jan 1, 1917, was 116, against only seventy-nine, Nov 1, 1918 The number of contract physicians in the service in 1917 was seventy, and in 1918 it was only sixty The best men are leaving the service, not only because of the totally inadequate compensation, but because of a niggardly policy otherwise which places pecuniary burdens on physicians unwilling to let their patients suffer the results

Below the $1 200 line are sixteen physicians who receive from $1,000 to $1,100, twenty-two who receive from $700 to $720, and seventeen from $600 to $660! Still lower payments may be assumed to represent the compensation of contract physicians

These seventy-nine regular physicians Nov 1 1918 (no later data being available through the Indian Office), have the assistance of fifty-five nurses, the number having been reduced from ninety-nine nurses in 1917, also largely because of totally inadequate compensation unduly prolonged hours of work, and often far from satisfactory living accommodations In the statement prepared by the Commissioner of Indian Affairs for the information of the Congressional Committee, it is said, "The personnel of the Indian Health Service is made up of the directorate at Washington D C the supervisory force, the administrative officers at each agency, the physicians and nurses the field matron and all the industrial employees at all schools, agencies and hospitals throughout the entire Indian field, each and all of these persons is intimately concerned *in carrying out some part* of the health program" All of which is contrary to the real facts for most of the staff referred to have other and far more immediately important functions to fulfil and they are neither paid to render sanitary or subsidiary health services nor are they qualified to do so

There is, broadly speaking no Indian health service, and very little is done to prevent the occurrence of disease though some progress has been made in the control of disease after its occurrence through a medical staff unquestionably much better today than at any time in the past This however, is not because of the policy of the government to pay adequately and provide for a medical and nursing staff but because of the earnest desire of the medical officers and associates to be of service The high ideals of these men and women are a credit not only to the service but to the nation as well The situation is so serious that the very existence of certain tribes is at stake Other tribes suffer a decrease or stationary condition of population because of a death rate which would be inconceivable under modern conditions if it were not sustained by the official records

The registration of births and deaths is far from accurate and complete On the Navaho Reservation, which represents one of our finest Indian tribes the death rate from tuberculosis is appalling (2847 per hundred thousand or 48 per cent of all causes) and the frequency of trachoma is not less than 25 per cent The examination of the Indian for tuberculosis is made superficially because the medical staff is not available The sanatorium treatment provided reaches at best, only a fragment of the population The required housing reforms have not been initiated, nor are proper efforts made to instruct the Indians in the rudiments of domestic hygiene. In view of the foregoing which could be much enlarged upon in matters of detail it is obviously the duty of the American Medical Association to concern itself with this question and to insist on radical and far-reaching reforms The Association should inquire into the question of adequate compensation and agree on a schedule of salaries commensurate with the responsible duties performed and it should ascertain the educational status of the physicians among whom there are reasons for believing that there are some not qualified to practice under the state laws

In England, assistant medical officers of health receive a minimum salary of £500 or about $2 500, a year The average health officer receives about £1 000, or $5 000 The chief medical officer of our Indian Medical Service, including more than a quarter of a million Indians, widely scattered over an immense territory, receives a salary of $3 000, or less than what is paid to the veterinary surgeons in the government service to the chief forester of the Indian Service, and the chief irrigation engineer!

It has been suggested that the Indian Medical Service should be transferred to the Public Health Service In my judgment such a transfer is called for by the highest considerations of Indian policy At the present time the Indian is slightly increasing in population, and the danger has probably passed that the Indian race *as a race* will die out, but if important tribes though relatively small in numbers, are to be saved from extinction prompt action on the part of the government is urgently needed

The argument has been advanced by the Commissioner of Indian Affairs that such a transfer would not result in further economies in the Indian medical administration What is required is easily a fourfold expenditure for the present purpose if our treaty obligations in behalf of our Indian wards are to be fulfilled in the spirit if not in the letter of the law It is not a question of economy, but a question of life and death The Commissioner of Indian Affairs in his evidence implies that there is perfect cooperation between the Public Health Service and the Indian Medical Department My own investigations do not prove this to be the case Broadly speaking there is no health service worthy of the name nor effective cooperation with either the state or federal authorities with the possible exception of some extraordinary emergency measures during an outbreak of smallpox or bubonic plague It would therefore seem to me that the American Medical Association should take up the question as to whether the Indian Medical Service should remain where it is at the present time or be transferred to the Public Health Service where it would seem more properly to belong

FREDERICK L HOFFMAN, Newark, N J

[COMMENT—The subject presented in the foregoing communication is not a new one The conditions result from undertaking to provide for the medical care of these wards of the government through a subdivision of a division of a bureau of the Department of the Interior In other words, there is no definite fixing of responsibility for the prevention and cure of disease on Indian reservations What little actually exists rests in a multiplicity of control with all its attending disadvantages The control of matters affecting the health of the Indians which should be the work of especially qualified physicians is in fact, under the direction of laymen who have the authority but who do not possess the necessary knowledge to consider and pass on such subjects The Indian Medical Service has suffered and is suffering from a vicious circle Insufficient compensation has made it impossible to secure and retain the services of a capable and sufficient personnel having a high standard of professional proficiency In turn, stock arguments for economy have seemed to have weight And so the wheel has turned A solution suggested several years ago was the placing of the Indian Medical Service in the United States Public Health Service Here again there is a technical, governmental difficulty The United States Public Health Service is a bureau of the Department of the Treasury whereas the Office of Indian Affairs is in the Department of the Interior The time may come when the federal government will establish a department having as its object the study and control of all matters relating to health Such a department naturally would give deserved consideration to the health of the Indians as well as to that of the other citizens of our country—ED]

UNIFORMITY OF RECORDS IN RADIUM TREATMENT

To the Editor —The following is the report of the Research Committee which was made at the meeting of the Radium Society in April at New Orleans It is the desire of the Research Committee that an accurate and uniform record be kept of all cases treated with radium In this way, uniform statistics may be collected, even though the treatment is given by many different individuals

LEDA J STACY, M D Chairman Rochester, Minn

SCHEDULE SUBMITTED BY RESEARCH COMMITTEE

1 Keeping records of all cases treated
First page short history diagnosis grouping based on physical findings
Second page

Case No	Date of Treatment	Amount of Element or Emanation Screening	Duration	Total Mg Hours or Mc Hours

2 Grouping of cases
A Operable
B Borderline or doubtfully operable
C Inoperable
D Advanced and hopeless
E Recurrences local regional

3 Determination of E S D of each tube of radium The E S D should be the standard of comparison of sensitiveness of the various elementary and diseased tissues

4 The methods of screening and protection of healthy surrounding tissues (*a*) distance (*b*) material used

5 The importance of postmortem examinations and serial sections of organs in toto this being the only means to determine the correctness of the technic and the actual permeability of the rays thereby establishing the actual therapeutic value of radium rays

6 The reexamination of all patients at stated intervals and careful recording of subjective and physical findings at each examination (both visible and palpable)

SYMBOLS FOR EYE PHENOMENA DURING ANESTHESIA

To the Editor —May I ask for your cooperation to secure suggestions for symbols to indicate the several eye phenomena which are observed during anesthesia I venture to submit those which I have used for some years and have given to my students at the Long Island College Hospital Brooklyn

Lid muscular tone present = absent < present and cornea sensitive the sign for present within a ring
Pupil size in mm if light reflex present size within a ring
Eyeballs oscillating ~~ quiet — incoordinated \
Cornea moist M hazy H dry D
Sclera normal + injected X bloodless I

A F ERDMANN, M D, Brooklyn

DIACETIC ACID IN URINE

To the Editor —In THE JOURNAL July 17 1920 p 206 is an abstract of an article in the *Medical Journal* of Australia in regard to the ferric chlorid test for diacetic acid in diabetic urine from patients who have been treated with sodium bicarbonate until the urine had become alkaline I had exactly the same experience as Dr Maxwell and performed all the tests and experiments which he mentioned and with the same results about two years ago I have looked through several books on urinalysis and clinical diagnosis and have failed to find mention of this reaction which I think should surely be called to the attention of the various authors I am writing you to ask whether you can suggest any convenient test to take the place of the ferric chlorid test which is useless when once the alkaline treatment has been begun Please reply through THE JOURNAL HENRY YOUNGS M D Goshen N Y

ANSWER—The article to which our correspondent refers is Ferric Chlorid Test for Diacetic Acid in Urine' by L. V. I Maxwell (*Medical Journal of Australia* **1** 458 [May 15] 1920) The reaction to which Maxwell refers is a well known one in inorganic chemistry and is due to the interaction of the ferric chlorid with the carbonate or bicarbonate radical giving rise to a red color which is similar to although not identical with that produced by diacetic acid and ferric chlorid It is strange that reference to this possibility has not been made in any of the textbooks on clinical diagnosis but such is the case so far as we have been able to determine As Maxwell points out the presence of carbonates or bicarbonates must be excluded before the Gerhardt test for diacetic acid may be relied on, as the dosage of alkali may be increased in the hope of overcoming an acidosis which in reality does not exist"

To obviate this fallacy of the ferric chlorid test for diacetic acid in the urine one should acidify the alkaline urine with dilute sulphuric acid and shake out this acid solution with ether which will extract the diacetic acid if present and will decompose the carbonates or bicarbonates and thus withdraw them from the field of action The ethereal solution should now be drawn off with a pipet placed in a second test tube and shaken with water and a few drops of ferric chlorid solution If diacetic acid is present in the original urine a deep red color will be seen in the watery layer This is the simplest method with which we are familiar for overcoming the difficulty mentioned by Maxwell and should be used as a matter of routine

A further test for diacetic acid in urine which is not given by urines alkaline from carbonates or bicarbonates is that of Lipliawsky which is a modification of the older test of Arnold The technic is as follows Six c c of Solution 1 (consisting of 1 gm of para-amido-acetophenon 100 c c of distilled water and 2 c c of concentrated hydrochloric acid) and 3 c c of Solution 2 (consisting of a 1 per cent solution of sodium nitrite) are treated with the same volume of urine, a drop of ammonia is added and the mixture shaken when it assumes a brick-red color According to the probable content of the urine in diacetic acid from 10 drops to 2 c c of this mixture are treated with from 15 to 20 c c of concentrated hydrochloric acid 3 c c of chloroform and from 2 to 4 drops of ferric chlorid solution The test tube is closed with a cork and shaken gently for from one-half to one minute In the presence of traces of diacetic acid the chloroform assumes a characteristic violet coloration while in the absence of this acid the color is yellow or light red This is an extremely delicate and reliable test for diacetic acid in the urine

OPPENHEIM MODIFICATION OF HARDY TREATMENT FOR SCABIES

To the Editor —Kindly advise what is the Oppenheim modification of the Hardy treatment for scabies

E L HILL M D Jacksonville Ill

ANSWER—A modification of Hardy's ointment was employed by Oppenheim for the rapid cure of scabies at the Wilhelminen Hospital Vienna Severe eczema and very diffuse impetigo constitute contraindications to the treatment but not the ordinary forms of eczema and impetigo The treatment is as follows

1 The whole body with the exception of the head is thoroughly anointed with soft soap for fifteen minutes special attention being devoted to the regions of predilection such as the wrist the axillary folds the groin and genitals the buttocks the popliteal space between the fingers and in the bend of the elbow

2 This is followed by a warm bath at 30 C for half an hour during which soft soap is liberally employed with a brush

3 The body is thoroughly dried and anointed with the modified Hardy's ointment (precipitated sulphur 25 potassium carbonate 10 petrolatum 125) the patient is wrapped in a sheet and is covered with a robe

4 After two hours the ointment is rapidly removed with soap in a warm bath, the body is dried and is anointed with zinc oxid ointment

The treatment lasts three hours Meanwhile the patient's linen and if desired the outer clothing also is disinfected with hot air

For children the duration of the treatment varies with the age The inunctions with soft soap should be continued for from five to ten minutes the baths for from ten to twenty minutes

Rush Med Coll	(1919)	87 1	Illinois

study of the tendon reflexes in tables are fully described This chapter contains material which should afford to the American neurologist a stimulus for continued careful research of the reflexes The second chapter dealing with injuries to the brain, contains much material on the diagnostic topography of lesions producing hemiplegia, consisting of cases separated into four groups those possessing cortical lesions, lesions of the pyramidal tract in the subcortical regions, lesions in the internal capsule and lesions of the pyramidal tract associated with injury to the basal ganglion

Of particular interest at this time is the contribution on the secondary and late complications of injuries to the brain consisting of epilepsy cerebral abscess, the meningoencephalitides, cerebral hernia and persistent fistulas In the third chapter are described fifteen cases of complete section of the spinal cord These cases were very carefully observed and permit of definite conclusions relative to the changes seen in the tendon and cutaneous reflexes the reflexes of defense sensory changes and disturbances of the bladder Special importance is given to the plantar reflex, which in the cases with complete section of the spinal cord produced flexion of all the toes The chapter on the results of the explosion of shells without producing external injury is a contribution which American neurologists will view with great interest One part alone namely, that dealing with meningeal hemorrhage, in the absence of external injury of which twenty cases are described, is sufficiently striking to merit careful study in the light of the absence in American literature of such observations Many other cases are described in which the examination of the spinal fluid revealed a marked lymphocytosis the symptomatology of which closely followed that of hysteria and was not associated with external wounds

The volume is replete with novel ideas not the least of which is the one that led M Guillain to describe the nervous troubles following chlorin gas intoxication It is one of the most instructive and valuable contributions to the literature of war neurology

ETUDE SUR L EPILEPSIE TRAUMATIQUE Travail du Service de la Clinique des maladies du systeme nerveux a la Salpetriere Par P Behague Paper Pp 320 Paris Louis Arnette 1919

This is another valuable monograph founded on exceptional experience furnished by the great war, the study being based on 439 cases of traumatic epilepsy observed in one service (that of Pierre Marie) at the Salpetriere The figures are impressive in more ways than one and unlike some war material this has been wisely utilized The patients were carefully examined many of them observed for long periods and proper records were made With the knowledge thus gained is correlated the experience and opinions of others all with good judgment and sense of proportion Consequently this brochure contains about all we certainly know about traumatic epilepsy, and is a safe guide In our opinion about the only weak thing in the book is the chapter on pathogenesis The author agrees that the cicatrix is an irritant that causes the convulsions But how does the cicatrix irritate? The author's idea is that it is by means of cerebral expansion which causes pressure on the scar tissue And this expansion is brought about by increased arterial pressure considerably augmented by the peculiar structure of the choroid plexus Just what starts the increase of arterial tension he does not elucidate.

PSYCHOLOGY OF DREAMS By William S Walsh M D Cloth Price $2 50 Pp 361 New York Dodd Mead and Company 1920

Dr Walsh has prepared especially for the general reader a summary of the literature on dreams particularly to aid sufferers from nervous diseases better to understand their mental processes A brief historical sketch cites most of the theories prevalent before the work of Freud This is followed by a discussion of sleep This preliminary matter occupies the first twenty-six pages of the book and all of the remainer is devoted to the dream itself The author has made a good analysis of the literature and his book may be read with interest both by physicians and by laymen

Medicolegal

Rights of Physicians, Associations, Sanatoriums

(Harris v Thomas et al (Texas) 217 S W R 1068)

The Court of Civil Appeals of Texas in affirming an order dissolving a temporary injunction granted the plaintiff, says that he asked that each of the defendants be restrained from interfering with his practice in a certain sanatorium It was the plaintiff's contention that the defendant physicians could refuse business relations with him only as individuals, and in their organized capacity could not influence others against him, that his exclusion from the organization and the defendants' refusal to affiliate with him and holding that his license as an osteopath did not entitle him to fellowship with them influenced others against him and deprived him of the fruits of his preparation as a practitioner But if the defendants were acting to further their legitimate purpose or to advance the practice of their profession this, the court thinks, would be justified even if it had the result claimed by the plaintiff Unless the organization was itself illegal or the methods used by it were wrongful, the plaintiff had no just complaint The county medical association was composed of what is known as regulars the purpose of which, the defendants answered, was not to injure any one but to elevate the standards of practice and advance the science of medicine and surgery It was provided by such association that an applicant for membership must be of good moral character and licensed to practice under the laws of the state of Texas, that he must not support or profess an exclusive system of medicine or advertise as such A voluntary association has the power to enact laws governing the admission of members and to prescribe the necessary qualifications for membership Membership therein is a privilege which the society may accord or withhold at its pleasure with which a court of equity will not interfere even though the arbitrary rejection of the candidate may prejudice his material interest This court thinks that such a society as this county medical association was is legitimate and lawful If it was an organization which was largely composed by the defendant physicians, and if it did directly or indirectly affect the material interest of the plaintiff or in some degree affect him as a nonmember, this would not justify the courts in denouncing it as an illegal or unlawful conspiracy The association had the right to advance its purpose or interest and that of its members by all legitimate means If it deemed the defendant an osteopath and that as such he was supporting an exclusive system the association and its members were within their rights, under its rules in rejecting him as a member They also had a right to refuse to assist him in operations They could, if they deemed it to the interest of medicine or surgery or the welfare of humanity agree among themselves *not to assist him in surgery* if they did so in good faith and with no intent to injure him To compel them to receive him into fellowship and accept his view would be to impose his will on them and to force the medical world to accept his theory of the healing art Courts have no such power Neither can the court see how a rule by the defendant physicians that there should be present at least three physicians at a major operation could affect the plaintiff If they saw proper to burden themselves with such a restriction they alone had a right to have it repealed Nor was the plaintiff justified in relying on the statutes authorizing the licensing of doctors as establishing that the defendant physicians and the affiliated medical associations the state and the American, were illegal in refusing to recognize him in their association, practice etc Furthermore the court believes that it was the right of the sanatorium to refuse business relation with the plaintiff, if it saw proper to do so and also to adopt such regulations as were proper or deemed by it necessary or expedient to improve its efficiency and standards of service therein and to require of those using its equipment that they possess specific medical learning and equipment in order to receive a membership on the medical staff To accomplish this it was at liberty to employ a committee as it did in this case to standardize the sanatorium If in good faith, with no evil intent to injure

or oppress the defendant physicians who were so appointed did formulate the rules of standardization and name the staff as directed, they had the right to do so subject to no other control than the governing authorities of the institution

Duty to Make Proper Diagnosis—Admissible Evidence

(Thorkeldson Nicholson (Minn) 175 N W R 1008)

The Supreme Court of Minnesota, in affirming an order that granted to the plaintiff a new trial after the action had been dismissed at the close of her testimony says it was alleged in the complaint that, her son being seriously ill, she called the defendant to treat him, that the defendant treated him first for grip then for typhoid and lastly for acute kidney trouble, that the patient was not ill with any of such ailments, but was suffering with empyema, and that the defendant carelessly and negligently failed to operate on him for the illness with which he was then suffering Fairly construed the complaint charged the defendant with negligently failing to ascertain his patient's ailment When a physician is called to attend a patient, it becomes one of his first duties to make a proper diagnosis and ascertain the patient s trouble This constitutes a first step in the physician s treatment of his patient If the defendant failed to bring to the diagnosis of his patient s case the proper degree of skill and care so as to enable him to administer the proper remedy, he would be guilty of neglect of duty This was what the complaint charged the defendant with Bearing in mind the fact that a proper diagnosis constitutes a part of proper treatment this court encountered little difficulty in this case

The plaintiff testified that subsequent to the death of her son she said to the defendant "'Dr Nicholson you had the boy for three weeks, and you treated him for three different kinds of sickness and you kept him there until it was too late to get any help for him', and he kind of stooped down his head, and he looked at me and the tears were in his eyes and he says 'Mrs Thorkeldson, I knew that Rudolph had been treated wrong and I know you can punish me for it but it will cost me money and it will cost you money and the mischief is done and you won't get the boy back again''

This conversation, if it occurred, was in the nature of an admission by the defendant against his own interest and was relevant to the issues and, when considered in connection with other evidence in the case, should have been submitted to the jury as bearing on the issues involved The testimony, as it stood at the close of the trial required the case to be submitted to the jury, and the court was justified in granting a new trial

No Inference from Refusal of Examination

(Cornell Great Northern Ry Co et al (Mont) 187 Pac R 902)

The Supreme Court of Montana says that, in this action brought by the plaintiff to recover damages for injury to his left eye, counsel for the defendants requested the court during the trial, to permit physicians present in the courtroom to make a physical examination of the plaintiff in the presence of the jury The request was denied They afterward requested instructions which would have told the jury in effect that the refusal of the plaintiff to submit to the examination at the request of counsel made in open court together with the circumstances might be considered by them and given such weight as they might in their discretion deem proper They insisted that the request and refusal should have gone to the jury under proper instructions to be considered by them as competent evidence on the theory that inasmuch as the episode had taken place in the presence of the jury they should be permitted to consider it as evidence which the plaintiff had in his possession but refused to disclose In other words the plaintiff having refused to submit to the examination which would have resulted in bringing to the knowledge of the jury stronger and more satisfactory evidence of the condition of his eye at the time the other evidence on that point produced by him should be viewed with distrust But the contention was wholly without merit The defendants had no right to make the demand and the plaintiff had a right to refuse to comply with it, under the previous holding of this court

Conviction of Practicing Without License Sustained

(State Bohls (Minn) 1[illegible] N W R 915)

The Supreme Court of Minnesota in affirming an order denying the defendant's motion for a new trial after he was convicted of practicing medicine without a license holds that an indictment charging that at a certain time and place the person named therein did unlawfully practice medicine and for a fee prescribe direct and recommend certain drugs and medicine for the use and medicinal treatmen (of a certain person) without a license so to do states an offense under Section 4981 of the General Statutes of Minnesota of 1913 Nor is it necessary under such statute that the indictment negative the exceptions in the statute, such exceptions not appearing in the enacting clause of the act. The court says that the indictment in this case stated that the drugs and medicine were for the use and medicinal treatment of one William Frank Bedner The undisputed testimony showed that at the time stated in the indictment William Frank Bedner was less than 1 year of age and was ill at the home of his mother who called the defendant over the telephone to come and treat the child and that the the defendant responded to such call examined the child left some medicine for him prescribed further treatment and received a fee of $15 therefor The defendant offered no testimony, nor was there any proof that he was licensed to practice medicine On the trial a druggist of the city was called as a witness He produced sixty prescriptions issued to divers persons in the vicinity which had been filled at his drug store all bearing date during the week mentioned in the indictment The witness testified that these prescriptions all bore the signature of the defendant in his own handwriting with the letters "M D ' appended thereto They were all admitted in evidence over the defendant s objection as bearing on the question whether the defendant held himself out as a practicing physician in the vicinity The supreme court finds no reversible error in the record

Selection of Physician—Refusal to Undergo Operation—Evidence

(Boa v San Francisco Oakland Terminal Rys (Calif) 187 Pac R [illegible])

The Supreme Court of California says that the plaintiff who was 72 years of age suffered a fracture of the neck of the femur One instruction given to the jury told them that if they found that the plaintiff was injured through the negligence of the defendant and that the plaintiff used ordinary care in the selection of a physician and surgeon for the purpose of treating her injuries it would be no defense to show that the physician or surgeon thus selected by her was unskilful or failed to give her the best or proper treatment provided she complied with the directions and submitted to the treatment prescribed by such physician and surgeon That instruction contained a correct statement of the law Improper treatment if proved would be no defense if ordinary care was used by the plaintiff in choosing a physician Consequently there was no error in sustaining objections to various question propounded to a medical witness for the purpose of showing that the plaintiff had not received proper treatment there being no evidence in the case tending to show that any information of lack of skill on the par of the physician chosen was brought to the knowledge of the plaintiff prior to the employment or that she continued with him after being informed of any lack of skill or failure to give proper treatment The evidence excluded should have been received only in the event that there was evidence in the case from which the jury might reasonably have found that the plaintiff was negligent in the choice of a physician

Another instruction informed the jury that in determining whether or not the injuries suffered by the plaintiff were permanent in character they must bear in mind that the law does not require one injured by the negligence of another to undergo a serious or critical operation when it is attended by some risks of failure if [illegible] reasonable diligence in caring for her injuries and able means to prevent aggravation of them and a speedy and complete recovery and a reasonable time

an operation could not be considered in mitigation of damages, even though under the evidence it might lessen the effects of the injury It was argued that the medical evidence introduced at the trial of this case proved that the operation referred to in this instruction, if submitted to by the plaintiff, would have effected a permanent cure It appeared, however, that there was conflicting medical testimony on this point, and, under such circumstances, the giving of this instruction could not be said to have been error

Unquestionably the physical and mental condition of the plaintiff resulting from the accident was material and mental suffering occasioned by any reasonable apprehension of future disability or deformity resulting naturally and proximately from her injury was a proper element to be considered by the jury in assessing the damages The disability apprehended was one arising from the blow occasioned by the defendant's car and could not be considered in any sense remote It followed that the plaintiff had a right to testify as to her belief at the time of the trial that she would be a permanent invalid It was insisted however, that there was error in allowing the plaintiff to state over objection, that various physicians with whom she had talked concerning her injury had informed her that 'in all possibility" she would never recover the use of her limb Even if it be conceded that the advice of physicians regularly retained in the case is a natural result of an injury to the person, the plaintiff failed to show that the physicians expressing the opinion in question had been regularly retained in a professional capacity The statements therefore, could at most be considered as purely casual and not connected with the defendant's wrongful act by an unbroken chain of causation If, therefore as this court thought on its original consideration of this case the plaintiff's mental suffering was to be considered as occasioned by these statements which bore no legal relation to the injury the admission of the testimony was prejudicial error But, while the court is still of the opinion that the admission of the testimony was error, it now holds that it was not prejudicial error the jury having been instructed to consider the objectionable statements solely for the purpose of determining how the plaintiff felt about her condition at the time of the trial and its effect on her mind

Comparing Roentgenograms of Both Knees

(City of Terre Haute v O Neal (Ind) 126 N E R 26)

The Appellate Court of Indiana Division No 1 says that, in this action brought to recover damages alleged to have been sustained by plaintiff O Neal in falling down a negligently covered coalhole in the sidewalk it was contended with reference to the evidence of a physician that the trial court erred in permitting him to state what in his opinion, based on his examination of the plaintiff produced the abnormal condition which he had testified existed in her left knee But this evidence on its face was clearly competent The fact that the record might disclose as the defendant contended that the witness had taken roentgenograms of both the plaintiff's knees and had examined and considered both of such pictures in forming his opinion as to the cause of the abnormal condition of the left knee was not a sufficient basis on which to predicate reversible error

Chemical Studies on Gastrin Bodies F C Koch A B Luckhardt and R W Keeton, Chicago—p 508
Essentials in Measuring Epinephrin Output Relation to Rate of Denervated Heart G N Stewart and J M Rogoff Cleveland—p 521
*Effect of Splenectomy on Growth in Young S C Henn, Chicago—p 562
*Importance of Vagal and Splanchnic Afferent Impulses on Onset and Course of Tetanin Parathyroprivia W L Palmer Chicago—p 581

Respiratory Dead Air Space—A new method of determining the capacity of the dead air space is described by Pearce and Hoover The percentage composition of the alveolar air can be determined with approximate accuracy from analysis of the expired air and an assumed volume of the dead air space if the depth of breathing is not excessive This method is said to be as reliable as the best direct methods now used for the determination of the percentage composition of alveolar air providing the respiratory volume is large enough to completely wash out the dead air space

Effect of Sodium Bicarbonate on Nerve Cells—It is held by Collip that the bicarbonate ion has a specific stimulatory effect on the nerve cells of the medulla and the motor cells of the anterior horn Disturbance in the concentration of the various kations particularly of the calcium ion within the nervous tissue produces most marked effects

Endocrine and Bile Formation—As a result of his experiments Downs feels inclined to believe that some at least of the endocrine organs exert a specific influence on the secretory activity of the hepatic cells leading to the production of bile The output of bile in the dog is increased by the administration of secretin The output of bile in the dog is decreased by the administration of epinephrin and by mammary orchic ovarian, pancreatic and thymic gland substances The amount of bile secreted is not affected in a constant or definite manner by the substance of the spleen and thyroid gland Blood pressure is raised by epinephrin Blood pressure is lowered by pancreatic substance and the secretin preparation employed A fall of blood pressure, ordinarily preceded by a slight rise is caused by orchic and mammary gland substances Oscillations of blood pressure are caused by ovarian and thyroid gland substances Blood pressure is not usually affected by either splenic or thymic gland substances

Effect of Splenectomy on Growth—Henn shows that the spleen is not essential to the life of young rats, rabbits, kittens and puppies and that splenectomy has a negligible influence on growth of rats rabbits and kittens In dogs splenectomized while young there is a hastening of the coagulation time of blood The younger the animals have their spleens removed, the more rapid is the coagulation time of the blood Corpuscles of young splenectomized dogs have the same property of more strongly resisting hypotonic sodium chlorid solutions, than control and operated control animals, as do animals splenectomized after having reached maturity Accompanying the removal of the spleen there is an increase of Kupffer cells in the liver and changes in lymph glands and bone marrow that indicate a compensatory function on the part of these tissues in supplying a missing factor in blood formation and destruction Male dogs, male and female rats and female rabbits are not rendered sterile through the removal of the spleen while these animals are young

Tetania Parathyropriva—Double vagotomy and splanchnectomy Palmer says have no influence on the onset and course of tetania parathyropriva, neither has artificial gastrointestinal irritation

Splenectomy for Splenic Anemia—This article is a stenographic report of a clinical lecture to third year students held by Cushing which really conveys the thought that it is most essential to acquire knowledge and judgment by keeping careful notes of cases and published articles A patient with splenic anemia is the subject of the clinical lecture To emphasize that a splenectomy which is suggested as a suitable means of treatment by the student clinician should not be regarded with too much enthusiasm, Cushing gives the history of two patients on whom a splenecomy was performed in 1898 for this condition One patient died ten days after the operation from rupture of an esophageal varix, the other patient is still alive and has served in the literature as an example of cure of splenic anemia by splenectomy the case sometimes having been quoted as "two cases The man has had severe hemorrhages ever since the last in July 1918 Cushing suggests that the operation may have prevented cirrhosis and ascites The pathologic changes in the spleens of these two patients were written up by MacCallum in 1900 but the report was not published In this article it is printed in full and Cushing calls attention to the fact that during he last twenty years little additional knowledge of the pathology of this disease seems to have been acquired

Diaphragmatic Hernia.—Four cases are reported by Bevan, who points out that the clinical picture of diaphragmatic hernia of the stomach is by no means a constant one The picture he has seen has been first stomach distress sometimes daily and sometimes coming on at longer intervals, the daily stomach distress is sometimes associated with pain coming on some time after the ingestion of food simulating somewhat the picture of ulcer sometimes that of gallstone disease and sometimes associated with vomiting simulating the picture of pyloric obstruction Occasionally these patients have pain only at long intervals and then apparently when they have overeaten or eaten something that has disagreed with them perhaps forming a good deal of gas In one of Bevan's cases the pain was particularly excruciating and came on at such irregular intervals as to suggest strongly the possibility of gallstone colic attacks The clinical picture of the cases in which the colon is involved may be suggestive of a beginning obstruction from carcinoma a partial intestinal obstruction relieved by cathartics and enemas with a disappearance of the symptoms and then a recurrence after an interval of days or weeks In cases in which a definite diagnosis of diaphragmatic hernia can be made and the patient presents symptoms which can be ascribed to this lesion unless there is some very strong contraindication an attempt should be made to cure the patient by operation Bevan describes a technic which he has worked out and which has seemed quite satisfactory

Esophageal Diverticulum.—Judd has operated in fifty-four cases of esophageal diverticulum with three deaths Two of the patients died following a one stage operation the third following the first stage of a two stage operation The ultimate functional results have been very satisfactory One patient was operated on for recurrence, and in one or two cases a sound has been passed because the esophagus seemed too small, but in no instance has a stricture developed

Direct Inguinal Hernia—The clinical history of direct inguinal hernia is discussed by Downes and the various operative procedures usually employed are described Downes prefers his modification of the Bassini operation consisting in a complete removal of the sac and the use of the rectus muscle The percentage of failures in direct hernia has been reduced more than half Downes cautions that if the condition of the lower abdominal muscles is such that a fair chance of obtaining a cure cannot be offered the question of operation should be deferred for the time being and the patient advised to take systematic exercises for a period of from six months to one year There is a small but definite group of patients with poorly developed muscles on whom it is not wise to operate for this condition as recurrence is almost certain to follow

Brain Tumor—Of the eighty-five patients seen by Sachs twenty-nine died or 35 5 per cent Eighteen of these twenty-nine deaths were in patients suffering with glioma and sixty-four or a little more than 74 per cent of the patients had tumors other than glioma and the mortality in these cases was only 17 per cent Sachs urges that every brain tumor should be treated on the theory that it may be a glioma and should be grouped with the most urgent cases that need hospital treatment Of the gliomas in his series 26 per cent were readily removable though successful extirpations constituted only 14 per cent

Amputation Neuromas—The results of a large series of animal experiments are reported by Huber and Lewis They believe that a neuroma indicates an attempt which is thwarted or blocked by scar tissue on the part of the neuraxes of a divided nerve to seek the distal segment and thus complete nerve repair When blocked the regenerating neuraxes form spirals and end disks and become irregularly dispersed throughout the connective tissue of the bulb The regenerating neuraxes react on the connective tissue elements of the bulb which as a consequence increase in number and maintain their embryonal characteristics longer than is normally the case The 'swing door or reversed V operation and crush and tie operation do not prevent neuroma formation Any method to be successful must be directed against the neuraxes Absolute alcohol injected into the nerve some distance (from three fourths to 1 inch) above the plane of section is more successful in preventing neuroma formation than any of the other methods ordinarily employed

Postoperative Pulmonary Complications—Fifty five pulmonary complications with eleven deaths in 1 562 operations constitute the study material of Cutler and Hunt Postoperative pulmonary complications constitute a serious menace to any patient who submits to operation Reliable statistics show that one patient in from every thirty to fifty patients operated on no matter what the anesthetic develops a pulmonary complication and one patient among every 150 to 175 patients dies from some such complication The factors responsible for this are complicated and not always preventable but an understanding of the mechanism suggests prophylactic measures Cutler and Hunt believe that embolism from the operative field is the chief factor in the etiology of such complications It is favored by (1) sepsis (2) trauma and (3) the mobility of the part Other factors of varying importance are preexisting lung disease the irritation of the anesthetic and such general factors as old age chilling and poor general condition Such embolism may occur immediately during the operation or during the convalescence and may be the cause equally of pneumonia bronchitis pleurisy empyema lung abscess or fatal pulmonary embolism Inhalation anesthesia on top of an existing lung lesion may be the dominant factor in some cases The following prophylactic measures are suggested (1) a reduction of [illegible] trauma in an effort to produce [illegible] (2) every effort in [illegible] prevention so that [illegible] stream non sepsis avoid if possible [illegible] lesion however slight

Dr. Robert Reiff
U. S. Medical

packs in laparotomies or by widely gaping wounds and by exposure after operation, and (5) to make each case before operation as good a risk as that individual case can be made

Chronic Arthritis—Under this head Ely includes arthritis deformans, osteo-arthritis, hypertrophic arthritis, degenerative arthritis This is the so-called senile form of arthritis, the "chronic rheumatism" of the elderly, the metabolic form of arthritis The essential feature of this type of arthritis is an aseptic necrosis with cavity formation in the bone at a short distance from the joint Infection in the jaws causes only this type of arthritis Mental emotion and disturbed digestion can only be considered as contributing causes, which change the secretions of the mouth, and make the infection in the jaws more active Trauma is effective only as straining a joint already mechanically damaged

Use of Sodium Iodid in Pyelography—The results of a comparative experimental study of the properties of the substances commonly used in pyelography, together with the clinical results obtained with sodium iodid are detailed by Cameron He found that the molar or 13 5 per cent solution of sodium iodid is fully as opaque as the 3 molar, or 25 2 per cent, solution of sodium bromid and is definitely more opaque than the standard neutral thorium solution which is correctly designated as a five-sixteenth molar thorium nitrate solution, but is commonly called the '15 per cent solution The molar, or 13 5 per cent, sodium iodid solution recommended is prepared by dissolving 15 gm of the salt in a sufficient amount of water to make 100 c c The molar sodium iodid solution is not the least expensive of the pyelographic mediums, but it is free from toxic effects and irritation as far as can be determined, is easy of preparation has the lowest viscosity and the lowest osmotic pressure of any mediums so far suggested colloids and emulsions alone excepted, and it exhibits an opacity to roentgen rays which actually increases relatively with increasing penetration of the rays definitely surpassing in this respect, the thorium and bromid solutions

Fat Soluble Growth Stimulants—Lard and cottonseed oil contain appreciable amounts of the fat soluble growth stimulant but it is demonstrable only when fairly large amounts are fed

Antiscorbutic Vitamin in Milk.—Evidence is presented by Hart and his associates showing that the concentration of the antiscorbutic vitamin in milk is dependent on the diet Summer pasture milk is much richer in this nutritive factor than dry feed milk or winter-produced milk involving the use in the ration of corn silage or sugar mangels Fifteen c c daily of summer pasture milk imposed on the basal ration used afforded protection against scurvy for twenty weeks to one guinea-pig However, for most individuals this quantity of milk was insufficient for scurvy prevention Fifty c c was a safer limit for complete protection At least 75 c c daily per individual of dry feed milk were needed for complete protection against scurvy The fact that milk produced from such dry feeds as used contained a measure of the antiscorbutic vitamin shows that the dry feeds themselves are not completely devoid of this nutritive factor

Cholesterol Synthesis in Infants—In the experiments reported on by Gamble and Blackfan the relation of the preformed cholesterol in the food to the total cholesterol metabolism was studied in infants by comparing carefully the intake and excretion of cholesterol Analyses of the nonsaponifiable fraction of infants' stools confirmed the observation of Muller that cholesterol is excreted in infants' stools without undergoing to appreciable extent change to coprosterol A method for determining cholesterol in milk and stool samples is described

Action of Pancreatic Hormone in Protein or Fat Metabolism—The experiments reported on by Allen and Wishart afford no evidence of a direct participation of the pancreatic hormone in protein or fat metabolism but their decisiveness is said to be open to question

Water Soluble Vitamin in Orange, Lemon and Grapefruit—According to Osborne and Mendel the fresh juices of the edible parts of the orange lemon and grapefruit contain water soluble (B) vitamin Their potency in this respect is quite similar to that of comparable volumes of cow's milk The efficiency of these fruit juices is not lost by suitable modes of desiccation A sample of grape juice tested was less potent than equal volumes of the fruit juices mentioned The edible portions of apples and pears furnish some water soluble vitamin, the quantity of these fruits necessary to supply this dietary essential is relatively very large, so that from a comparative standpoint they cannot be regarded as rich in this food factor Prunes apparently are richer in the water soluble vitamin From preliminary experiments it seems doubtful whether the juices of the lemon or grapefruit contain more than traces, if any of the fat soluble vitamin Observations on orange juice are indicative of some potency in this vitamin

Antiscorbutic Property of Potatoes—Data are reported by Givens and McClugage concerning the antiscorbutic value of white potatoes subjected to various temperatures and treatments Ten gm of raw white potato have protected the guinea-pigs against scurvy for the duration of the experiment, 129 days The influence of heat on the antiscorbutic vitamin

appears to be related not only to the degree of temperature but to the duration of the treatment, the reaction, the enzymes present, and the manner of heating

Value of Peanut Flour in Bread Making—Bread made with a mixture of 25 parts of peanut flour and 75 parts of wheat flour furnished adequate proteins and water soluble vitamin for normal growth A similar bread containing 15 parts of peanut flour and 85 parts of wheat flour contained proteins and sufficient water soluble vitamin for growth at very nearly the normal rate

Metabolism in Amyotonia Congenita—The significant facts observed by Ziegler and Pearce in the metabolism of a case of amyotonia congenita were (1) a lowered creatinin excretion, in addition to the excretion of creatin on a low protein diet, (2) a normal uric acid excretion, therefore no nucleoprotein broken down (3) an increased rest nitrogen accompanied by an increased neutral sulphur, (4) a normal phosphorus excretion, therefore no bone disintegration, (5) a lowered chlorid excretion

Antipneumococcus Serum Treatment of Experimental Pneumonia—In experimental pneumococcus Type I pneumonia in monkeys, the intravenous injection of Type I antipneumococcus serum exercises a specific therapeutic effect frees the blood promptly and permanently from pneumococci shortens the course of the disease, and greatly moderates its severity Of five monkeys inoculated intratracheally with lethal doses of pneumococcus Type I all developed pneumonia, and all recovered following the administration of Type I antipneumococcus serum, while the controls died Cecil and Blake point out that the earlier the serum is administered the shorter and less severe the pneumonia Frequent injections are also an important factor in obtaining results When serum treatment is instituted late in the disease the injections must usually be continued over a longer period of time in order to achieve success Normal horse serum exerts no beneficial effect whatever in experimental pneumococcus Type I pneumonia

Calcium and Magnesium Metabolism in Monkeys—From the fact that in leprosy there is a definite retention of calcium and that the more advanced the stage of the disease the greater is the degree of retention Underhill and his associates believe that the organism of leprous individuals is in need of calcium Magnesium may also be retained in leprosy but the degree of retention is much less marked than in the case of calcium With the exception of the retention of calcium and magnesium the leprous organism responds to changes in the intake of calcium and magnesium in the same manner as normal individuals The results of this investigation suggest that in leprosy the administration of calcium may be of benefit as an additional therapeutic measure in an endeavor to retard of arrest the progress of the bone changes characteristic of the disease.

Calcium and Magnesium in Cartilaginous Exostosis—The facts enumerated by Underhill and others suggest that in the early stages of exostosis that is during the proliferative cartilage changes the progress of the disease may perhaps be checked by proper dietary procedure, restriction of calcium and magnesium intake

Reaction Hyperemia—Improvements are described by Grant and other in the method of following temperature changes, and thus alterations in vasomotor tone in exposed mucous membranes The palatine tonsils like the palate pharynx and skin react to chilling of the body surface with reflex vasoconstriction and ischemia The hypothesis is advanced that one factor in the beneficial hardening effect of cold bathing and outdoor living with its incident heightened immunity to respiratory infection may be the training of the vasomotor system in the direction of development in the pharynx of a reaction of hyperemia following chilling similar to that observed in the tonsils

Transplantation of Spleen—No instance of survival of spleen homeografts beyond the usual taking and persistence for one or two weeks common to most homeografts was noted by Marine and Manley although the possible advantages of consanguinity age and splenectomy were fully utilized This is in sharp contrast to thyroid sex gland and suprarenal cortex homeografts with which one may expect 10 per cent to survive the thirty day period It suggests that spleen is a stronger antigen and excites a greater degree of immunity more quickly With autografts survival and growth are the rule, and failures are due to technical errors Age is an important factor in the growth of autografts The younger the rabbit the more growth is aided This beneficial effect decreases gradually and becomes negligible after sexual maturity Removal of the spleen is a powerful stimulus to the growth of transplants The effect varies inversely with the age and usually is negligible after sexual maturity The influence of age and splenectomy suggests that the spleen is most important in early life and after sexual maturity is either unimportant or its functions may readily be assumed by other tissues (hematopoietic) Anatomically the spleen is a highly complex structure but biologically all the major elements of the spleen are simple as indicated by the uniform and marked regenerative capacity There is a tendency for grafts to involute or atrophy with age and grafts made in old rabbits without removal of the spleen may undergo complete atrophy Grafts made in young rabbits accompanied by splenectomy have been observed for more than three years and may be said to be permanent There is some evidence that subcutaneous autografts react to infections in the same way as the intact spleen

Etiology of Epilepsy—A statistical study was made by Block of the etiologic factors, and some general considerations, in 200 cases of epilepsy No attempt is made to prove or disprove anything

Active Immunization Against Diphtheria—Sidbury is convinced that universal application of the Schick test to all children up to 15 years and the administration of toxin-antitoxin to the nonimmunes, and to all children under 2 years, would practically eliminate diphtheria The results of his retests show that the administration of toxin-antitoxin reduces the nonimmunes from 100 per cent positives to 20 or 30 per cent positives at the end of one year

Use of Cautery in Acute Epididymitis—The most dependent point of the scrotum immediately over the swollen globus minor is selected as the site for operation The skin is painted with iodin The scrotum is held taut, the skin and coverings are infiltrated with procain The cautery at white heat is passed through the scrotum into the globus minor, where it is permitted to remain for from sixty to eighty seconds Petrolatum on a sterile dressing is applied to the wound and a suspensory bandage is snugly fitted The patient is permitted to get up from the table and go home immediately Thirty-one patients have been treated by Vinson by this method Without an exception they have experienced an immediate feeling of relief The reaction from the burn has been of short duration The wound has healed in from two to four weeks

Operative Injury of Bile Tracts—Eisendrath reviews the literature, analyzes fifty-one cases of injuries of bile ducts, and points out how injury of these ducts may be avoided during operations by following a proper technic

Origin of Ranula—Thompson advances the theory that ranula submaxillary cysts, and deep cervical cysts are derived from vestigial remains of the branchial clefts that the primary cyst is derived from the cervical sinus in relation to the external depression of the second cleft, that the cyst is carried from its original position by the shifting of muscles during the formation of the neck, by which part of the cyst (deep cervical) is carried up to the base of the skull by the palate muscles which are derived from the third and fourth arches, and part carried into the submaxillary region and tongue by the migration of the muscles of the hypoglossal group

Jaundice in Ectopic Gestation—Jaundice is a not uncommon symptom of ectopic gestation It was present in two cases reported by Norris Jaundice is of great importance and may frequently be the symptom which determines the differential diagnosis In these cases it is probably due entirely to the absorption of blood derived pigments produced by the hemolysis of the extravasated blood The blood serum often contains considerable quantities of blood pigment (hemoglobin hematin hemochromogen, hematoidin) Norris suggests that in the progress of the differential diagnosis the blood serum should be studied both grossly and with the aid of the spectroscope

Transplantation of Kidney and Ovary—The left kidney and ovary together with their blood supply were transplanted by Dederer from one puppy to the neck of another of the same litter Circulation through the organs was continuous with the exception of forty-two minutes during which time the organs were simply left out in the air in the field of operation The function of this kidney was demonstrated from time to time, including one test on the twenty-sixth day after operation, when phenolsulphonephthalein was freely excreted appearing in two minutes and forty second after its intravenous administration On the twenty-sixth day the symptoms and signs of intussusception were noticed Intussusception of the lower small intestine was found at operation An acute inflammatory lesion, comprising edema of the intestinal wall and ulceration of the mucous membrane was found at the entering end of the antussuscipiens The affected area was excised and closed by suture The dog died the next day Necropsy showed the signs of distemper particularly a generalized bronchopneumonia The transplanted organs were removed and tested as to transplantability by anastomosing renal vessels to the splenic vessels of another dog Arterial union was satisfactorily made but the venous anastomosis was not accomplished, in a measure because of the development of a dense adventitia The arterial blood which entered the kidney was under considerable pressure because only a portion of it escaped at the site of attempted venous anastomosis However no damage was observed to result from this influx of blood as was shown by microscopic examination of fixed and frozen sections

Impacted Fracture of Neck of Femur—Lilienthal's patient walked from the time of the accident Three weeks after the accident roentgen-ray examination disclosed an impacted fracture of the neck of the right femur

Artery of Round Ligament—According to Baldwin no blood supply reaches the uterus through the round ligament, but a minute artery carries blood from the uterus into the ligament This artery is so small that in the ordinary technic of hysterectomy the round ligament can be cut across with absolute impunity Baldwin points out that this fact should be emphasized and statements to the contrary in textbooks be corrected

Krukenberg Tumor—The primary growth was small, the metastases were enormous in Chapman's case The patient

was only 14 years of age but the clinical picture coincides accurately with the indisputable and best authenticated type of the true Krukenberg tumor There were two tumors one from each ovary, both were solid The growths weighed 6 and 7 pounds, respectively A growth the size of a dollar, or definitely scirrhus-carcinomatus appearance and feel was found on the lower edge of the anterior wall of the stomach, at the middle of the greater curvature The patient died about twenty days after operation, apparently from exhaustion The entire course of her illness from the time enlargement of the abdomen was first noted was less than three months

Comparison of Allen and Joslin Methods of Treatment of Diabetes—Two cases of diabetes mellitus are reported by Craver which show some interesting comparisons of methods of treatment One patient with a sugar output of from 106 to 125 gm per day, had his sugar output only moderately reduced by the old-fashioned protein-fat diet and developed marked acidosis while with the Allen method of straight starvation followed by alternate feeding and fasting, thirty-four days were required to render the patient sugar free and there was produced thereby considerable acidosis marked weakness and loss of weight The second patient on the other hand, entering with a sugar output of from 300 to 500 gm per day, required only five days to become sugar-free, and at no time had to undergo the discomforts of complete fasting, this result being accomplished by Joslin's method of first eliminating all fat then rapidly diminishing protein, and cutting down carbohydrate last of all This patient remained sugar-free over a period of five days while still getting from 14 to 45 gm of carbohydrate and sugar returned only when the diet had reached carbohydrate 63 gm protein 60 gm, and fat 25 gm At no time did this patient have more than a slight acidosis as indicated by the presence of acetone, but the complete absence of diacetic acid from the urine

Operation for Prolapsus Uteri and Cystocele—Swayne makes a median incision through the vaginal mucous membrane from a point about three quarters of an inch behind the urethral orifice to the midpoint of the reflection of the vaginal mucous membrane from the cervix The vaginal mucous membrane is then incised on each side of the cervix to a point just behind the mesial plane of the uterus the incisions when completed forming a T with a curved top Two lateral flaps are then dissected up roughly triangular in shape and attached by their longer sides The bladder is separated from the uterus as high as may be necessary to expose the bases of the broad ligaments and the dissection carried onward on each side until sufficient space is obtained This suture is then firmly tied so that the cervix is pushed backward and upward and two folds of connective tissue can be seen running from just outside the tied suture to the back of the symphysis forming a well marked triangle with its base at the cervix These folds are then sewn together by means of a continuous suture of medium catgut the bladder being pressed upward with a flat retractor The vaginal flaps are brought together and sutured The cervix may be amputated or the perineum repaired as the necessities of the case may demand

Low Blood Pressure Cause of Death in Lobar Pneumonia—In four of Edgeworth's cases about 3 per cent death occurred apparently as the result of a persistent fall in the blood pressure In three this happened during the fever in one just when the temperature had fallen by crisis to the normal In one case one-third grain of tyramin injected hypodermically raised the blood pressure from 80 to 105 mm Hg within two hours and its administration every four hours the blood pressure up On the other hand in two cases seen for the first time at the end of the crisis with a fallen blood pressure—as estimated by the finger—tyramin failed to prevent death The drug thus seems useful if used directly the blood pressure begins to fall If this has already fallen to a dangerous point no treatment will prevent a fatal termination

New Herniotomy—In the method described by Cheatle the patient is placed in the Trendelenburg position, an incision is made to one side of the middle line the rectus abdominis is split longitudinally and the abdominal wall is retracted to the side of the operation The peritoneum is smoothed away by a dry swab from the parietes The operation is conducted without opening the peritoneum The sac between the internal ring and the surface of the peritoneum is delimited by insinuating the forefinger between it and the external iliac artery and vein The sac is ligatured at the peritoneal surface The part of the sac that extends into the inguinal canal is pulled up into the subperitoneal space as far as it will come, tied as low down as possible and then it is allowed to slip back (or is replaced) into the inguinal canal, so that it cannot act as a guide for a recurrent hernia The delimitation of the sac in the subperitoneal space is simplified by packing back the peritoneum with gauze in a direction upward and away from the seat of operation The muscle fibers and their sheath are separately sutured There is nothing to stop a surgeon occluding the internal ring by suture should he desire The younger the patient the great is the simplicity of the operation The operation is not applicable to inguinal hernia in which intestinal adhesions exist within the sac

Secretion and Epithelial Regeneration in Mid Intestine of Tabanus F W Cragg—p 648

Bacteriology of Influenza—Malone found that 92 per cent of the strains of Pfeiffer's bacillus tested produce indol when grown in suitable culture mediums No other hemophilic organism present in the respiratory tract of healthy persons or of influenza patients is known to possess this property Therefore, the indol reaction can be used as a means of identifying Pfeiffer's bacillus in pure cultures, and recognizing its presence in mixed cultures A method described by Malone is claimed to be more accurate and more easily applied than the laboratory methods usually employed for the recognition of Pfeiffer's bacillus in the secretions of the respiratory tract of influenza patients Malone claims that a transparent solid medium containing heated blood is more satisfactory for the isolation and identification of Pfeiffer's bacillus than ordinary blood agar Heated pigeon's blood has given the best results in his experience Ordinary blood agar (human, rabbit or sheep) was used for isolating pneumococci and streptococci

Lethargic Encephalitis and Influenza—The history of ten cases seen by Malone and Maitra failed to record an attack of influenza, and in one case only was there influenza in the family Moderate leukocytosis occurred in all the cases with a definite increase of polymorphonuclear cells The total leukocyte count varied but little during the illness, but as the patient's condition improved there was noted a decrease in the polymorphonuclear neutrophils and a relative increase in the eosinophils and small monocytes The cerebrospinal fluid of every case was clear but contained an excess of globulin There was no increase of cells

Groundnut Culture Medium—The preparation of a culture medium from caseinogen (groundnut press cake) is described by Norris and the results obtained from it are compared with those given by a meat medium

Effect of Vitamin Deficiency on Thyroid—McCarrison's studies have shown that dietaries deficient in vitamins lead to a reduction in size and weight of the thyroid gland and render it susceptible to the noxious action of intestinal bacteria, or of their products, with resultant atrophic and necrotic changes A scorbutic diet of crushed oats and autoclaved milk may cause in guinea-pigs considerable enlargement of the thyroid in the main the result of congestion and hemorrhagic infiltration of its tissues Dietaries containing adequate provision of vitamins, but excessively rich in proteins and fats induce in the thyroid of pigeons in confinement marked degrees of hyperplasia, the extent of the hyperplasia being largely dependent on the duration of the organs' exposure to the goitrigenous influences induced by the excessive protein and fat content of the food The addition of onions to a dietary excessively rich in protein and fats while containing at the same time an abundance of vitamins, markedly retards the development of thyroid hyperplasia, and the tendency to acinar budding in pigeons living in confinement The beneficial influence of the onions is held to be due in part at least to their action in restraining the growth of putrefactive types of bacteria in the gastrointestinal tract and in retarding the absorption of their products It is suggested that succus alii might prove of benefit in restraining the thyroid hyperplasia of exophthalmic goiter The changes in the parathyroids induced by a diet deficient in vitamins and excessively rich in starch and fat appear to be related in their origin to intestinal anaerobes, the noxious action of which is greatly favored by the defective diet

Suppression of Urine Caused by Cortical Necrosis in Kidney—Six of twelve cases of suppression of urine in pregnancy seen by Jardine and Kennedy were proved by postmortem examinations to be due to symmetrical necrosis of *the renal cortex. All these patients suffered from what is* known as the toxemia of pregnancy

Hemorrhage Following Hemorrhoid Operations—Gabriel's paper is based on an analysis of 500 cases of internal hemorrhoids. Ligation was performed in 470 cases, the clamp and cautery method in eighteen and Whitehead's operation in twelve cases. Of the three cases of intermediate hemorrhage requiring treatment two followed a ligature and one a Whitehead's operation. Five cases of serious secondary hemorrhage followed a ligature operation, four on the seventh and one on the eighth day after operation. In addition there were eight other cases of slight secondary hemorrhage after defecation, of no special consequence and requiring very little treatment, seven of these followed a ligature operation. Plugging the rectum with a vulcanite or rubber tube Gabriel found is the most generally efficient method of controlling the hemorrhage which is to be combined with suitable general treatment.

*Anaphylaxis M Kopaczewski—p 361
Supraclavicular Hollow as Sign of Isolated Paralysis of Serratus Magnus G Guillain and E Libert—p 383

Intrapleural Tension—Flurin and Rousseau present evidence that most of the physical and functional signs of an *effusion in the pleura and several of the mishaps for which* thoracocentesis is held responsible are in reality due to modifications of the intrapleural tension. By doing thoracocentesis without attempting to aspirate the effusion the pressure rights itself and there is no danger of mishaps and the patient does not become fatigued. He reclines on his back, the edge of the thorax close to the edge of the bed. The puncture is made in the sixth or seventh interspace as close as possible to the posterior axillary line and all of the fluid is allowed to escape spontaneously. The tension at the close was always found normal.

Tetany from Hemorrhage in Parathyroids—In Cordier's case the man of 41 with chronic dysentery and paroxysmal pains in the neck suddenly developed tetany of the arms and hands and necropsy disclosed a hematoma in the tracheothyroid space which had destroyed the right parathyroids with hemorrhages in the left parathyroids. *Cordier comments* on the rarity of hemorrhages in the parathyroids in adults in comparison to its frequency in children. Vanase has reported finding them in 37 per cent of children most in those with exaggerated electric irritability but Cordier knows of only one other case of spontaneous tetany in an adult with destruction of the parathyroids demonstrated at necropsy.

Anaphylaxis.—Kopaczewski reports from the Pasteur Institute at Paris experimental and clinical research commenced in 1915 which has thrown new light on the nature of anaphylaxis and on means to ward it off. He found first that the toxic shock could be induced by contact of the serum with pectin a nonnitrogenous substance and Bordet demonstrated the same with pararabin and Schmidt with starch—all free from nitrogen. The ultramicroscope revealed that when the serum had thus been rendered toxic its micellar structure changes that is the ultimate molecular mass of protoplasm becomes agglutinated. This agglomeration occurs exclusively in toxic serums and does not occur if the toxicity is prevented by the action of antiflaking factors. He reiterates that *this is a specific phenomenon. The flaking of the micella* seems to be the cause of the morbid phenomena and they can be prevented by preventing the flaking of the serum either by reducing the superficial tension or increasing the viscosity of the fluid before bringing the serum into contact with the colloidal substance or suspension of bacteria. His research further demonstrated that only colloidal substances in the gel state of a certain structure and with a pronounced electronegative charge were capable of this toxic action. All these facts he says constitute a solid experimental basis for the assumption of a colloidal flaking which by obstructing the capillaries suspends the vital functions.

Electrodiagnosis—Marchal warns that even when the reaction of degeneration is total the prognosis must not be based on this alone while a partial reaction of degeneration permits a favorable prognosis. He recalls further that the waves of the galvanic and the faradic stimulus are of different lengths and time must be allowed for this in estimating the responses. Faradic bipolar exploration is usually all that is necessary for preliminary classification of cases.

Treatment of Genital Prolapse—Mercade sutures the levator ani muscles together through the roof of the anterior vagina in treatment of prolapse of the uterus and here reports a case in which after vaginal hysterectomy he sutured these muscles together all the way from the bladder to the rectum. This provides a solid floor for the pelvis.

Postoperative Jejunal Ulcer—Pauchet found scrap of suture material in five of seven postoperative ulcers at the site of the anastomosis even when the nonabsorbable suture material had been used only for the second suture. Since then he uses only catgut but suggests that nonabsorbable material might be used for suturing the mucosa as this would certainly be sloughed off in time. Hyperacidity was the rule in his eleven cases of jejunal ulcers and for this reason he tries to reduce the secreting area of the stomach in operating on this organ or makes the anastomosis as far *from the pylorus as possible. In one case the ulcer developed* at the point where the clamp had been applied and was the same shape and size as the impression of the clamp. Exposure of the mucosa from clamp and fingers or subsequent a hem-

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

SUKRO-SERUM AND APHLEGMATOL

Report of the Council on Pharmacy and Chemistry

Two years ago, American newspapers contained accounts of an alleged cure for pulmonary tuberculosis "discovered" by Prof Domenico Lo Monaco of Rome, Italy At that time no reference to the "cure' could be found in medical journals which had come from Italy and other European countries (THE JOURNAL A M A., July 13, 1918, p 142) Later, reports were published of experiments carried out in Italy, according to which the intramuscular injection of solutions of sugar (saccharose—cane sugar) diminished pulmonary secretion and was of considerable value in the treatment of tuberculosis (THE JOURNAL A M A Sept 28 1918, p 1083) On the whole, the reports of the trial of what has been called the Italian Sugar Cure for Consumption have been unfavorable At a meeting in Paris in October, 1918, Drs Louis Renon and Mignot reported that they had found that the disease in guineapigs was not modified by the treatment and with humans, the results were also negative (Paris Letter, THE JOURNAL A M A, Nov 23, 1918, p 1760)

In view of the exploitation of this treatment in the United States by the Anglo-French Drug Co, which offers "Sukro-Serum," and by G Giambalvo & Co, which sells "Aphlegmatol," and because of inquiries received, the Council has authorized publication of the statement which follows

W A. PUCKNER, Secretary

A circular issued by the Anglo-French Drug Co describes "Sukro-Serum" as a "Sterilized Solution of lacto-gluco-saccharose ' By reading the circular to the end, however, one learns that 'Sukro-Serum' is not a "serum" in the ordinary sense but apparently it is a solution of ordinary sugar (sucrose) "Sukro-Serum is a sterilized, specially prepared solution of Saccharose"

Sukro-Serum has been advertised (*N Y Med Jour* Sept. 6, 1919) as an INTRAMUSCULAR INJECTION FOR TUBERCULOSIS' " ready for use in cases of Pulmonary and general Tuberculosis" with the assertion that "It is quite certain that in the near future Sukro-Serum will be largely used and its value fully recognized' The circular received from the Anglo-French Drug Co contains quotations from an article by Professor Lo Monaco in the *British Medical Journal* (Aug 24, 1918) setting forth the merits of intramuscular injections of sucrose in tuberculosis It is recommended that 'Neocaine-Surrenine (which the Anglo-French Drug Co supplies) be used for the control of pain when Sukro-Serum is injected

The circular enclosed with a package of "Aphlegmatol ' purchased from G Giambalvo & Co, contained the following with reference to the composition of this preparation

A solution of Hydrats of Carbon After the formula of Prof D Lo Monaco Director of the Institut of Physiological Chemistry of the Univer ity Of Rome Contents *Sucrose* ($C_1H_{22}O_{11}$) *Glucose and Galactose* ($C_6H_{12}O_6$)

The package contained ampules of thin, fragile, brown colored glass, containing approximately 2½ c c of light, clear, amber colored, thick, sticky fluid having a distinct caramel odor Reaction $p_H = 5.0$ A reducing substance (probably glucose) amounting to 7.4 per cent was found by using Benedict s method for estimating glucose quantitatively, after hydrolysis with hydrochloric acid, 55 5 per cent glucose was found There was no reaction for albumin No attempt was made to identify the sugars, as it seemed probable that in the preparation caramel had been produced

The circular which accompanied the package of Aphlegmatol contained the following information (spelling and composition as in original) about its use and effects

To be employed wherever a large bronchial secretion is present in the respiratory branches disease The secretion will diminuish and in non complicated cases it will completly disappear

Fever cough hemottisis night prespiration vomiting and difficulty of breating are in the meantime diminuished

Aphlegmatol acts also as a riconstituent being itself a nurrishing composition improves the digestive function of the body and increases the arterial pressure

5 c c (2 Phials) of Aphlegmatol per day must be injected intra muscularly in the Gluteus

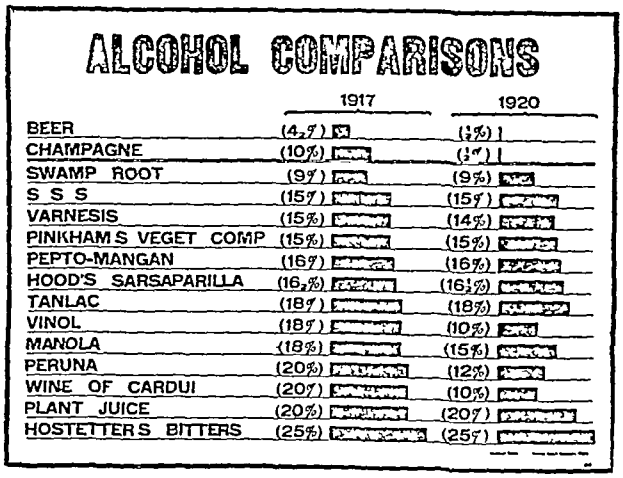
If the patient wishes two injections may be made one at the right immediatly followed by a second one at the left

The cure must not be interrupted untill sometime after expectoration has desappeared which result may be obtained only after fifty or sixty days in the meantime the patient must be controlled by his home physician especialy when thermal elevation of the body takes place

Improvement will be manifested on or about the tenth day of the first injection

In the advertising circular, which is apparently intended for general distribution, much the same information is given as in the sheet enclosed with the ampules, except that in the directions we find "If the injections are painful—especially in cases where patients are very emaciated—*physicians are advised to inject* together with *Aphlegmatol* as an anesthetic a vial with 1 c c solution of Stovain at 3%' The advertising for Aphlegmatol contains many misspelled words and appears to be the work of those ignorant of the English language

Tuberculosis is a widespread disease and a majority of the uninformed are only too willing and ready to try such a "cure" The preparations appear to be nothing more than concentrated solutions of sugar It is probable that a small amount of cane sugar might be inverted to glucose and fructose but experiments have shown that cane sugar subcutaneously administered in the small amounts used in this instance is largely excreted in the urine unchanged Less is known about galactose, but the evidence available would indicate that galactose is largely excreted in the urine unchanged when given subcutaneously Glucose would be absorbed as such, and the amounts under consideration, used by the system much the same as when given by mouth



Miniature reproduction of one of the educational posters prepared by the Propaganda Department of THE JOURNAL The originals measure 22 by 28 inches

What Is a Health Center?—The term "health center" has been very loosely used as a name for everything from a milk station to a miniature health department A real health center should be a complete health department In a small city the health department should be the health center In larger cities health centers should be established for the purpose of decentralizing official health activity and linking with it every agency carrying on public health activities within the area It should also serve as a common headquarters in order to effect the closest cooperation with workers for sociologic and economic betterment—A J McLaughlin, *Public Health Rep* April 30, 1920

Correspondence

DISEASE TRANSMISSION AND THE SCHOOL

To the Editor —In the *Weekly Health Review* of May 29, 1920, published by the Department of Health, City of Detroit, and edited by Mr George F Palmer, epidemiologist, appears an article entitled 'Age and Disease" which expresses such unusual opinions regarding the problem of communicable diseases in the schools that I feel obliged to take exception to it This is all the more necessary when it is appreciated that the article emanates from no less authority than the department of health of one of our largest American cities Doubtless many readers, lacking a medical perspective or failing to study the article, will assume the statements to be authoritative instead of purely speculative

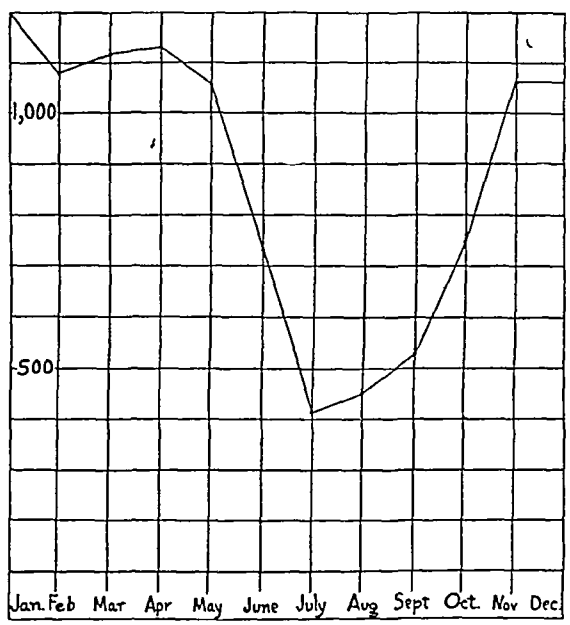
The article opens with the statement that "There are more cases of scarlet fever, diphtheria, measles and chickenpox reported among 6-year old children than at any other time during life This is the experience in Detroit during 1919" Based on these statistics the question is asked 'Does this mean that there is actually more disease among children just entering school or that more disease is discovered at this time? Judging from the number of cases discovered by school nurses in the homes, it would seem as though schooling does not produce more disease It simply reveals more disease"

Then follows a table of statistics expressing in percentages the incidence of these diseases by age groups, the actual number of cases on which the study is based is not given however It is shown that there is a gradual increase in incidence which reaches its peak at 6 years, followed by a decline which is slightly more abrupt Certain of the diseases are then discussed in an effort to show that the school is of minor, if of any importance, in their spread In speaking of scarlet fever the statement is made that "increasing motility and traveling radius with advancing age would seem to have more influence than the act of entering school, for the increase at 6 over 5 or 5 over 4 is no greater than the increments below these ages This applies to diphtheria as well' Again "In measles the increase at 5 and 6 is more abrupt School in this case undoubtedly brings many more cases to light There is no reason to believe that it is responsible for spreading measles" Still further it is stated that chickenpox resembles measles in that the reported cases are more numerous at the age of entering school Here, also it would seem that school attendance is responsible for discovering rather than spreading the disease" In conclusion, this generalization is made 'It would appear from the above that the exclusion from school of children above 10 years or at least 12 years because a younger brother or sister has some minor contagion, would hardly justify the time lost from school'

For our present purpose we will assume that the statistics on which this study is based are sufficiently large to warrant conclusions, and on this basis we will inquire into the justification of the conclusions that have been reached First let us consider the modes of transmission of these infections and whether the school can be a potent agent in furthering such transmission

All modern authorities agree that these diseases never originate spontaneously but are always transmitted to the well, especially by those in whom the disease is passing from the stage of incubation to the stage of expression, by those having the disease in a mild and unrecognizable form or by those termed healthy carriers The usual course of transmission is by direct contact, this is true in such a large proportion of the cases that we need not consider the indirect or mediate methods here

Certainly the school is a fruitful field for direct contact, for hours at a time the pupils are within the zone of droplet infection one with another All pupils are possible disseminators of such infections They are drawn together in the school from a rather large geographic area compared with the restricted area covered by playmates at home It is easy to understand, therefore, how such a disease as scarlet fever may pass from one neighborhood to another through the school



Monthly incidence of scarlet fever representing medium prevalence for thirteen years in Pennsylvania

The author of the report in question constantly belittles the importance of the school as a factor in the transmission of these diseases but he also states that 'increasing motility and traveling radius' exert a decided influence Certainly he must have in mind that *increasing motility and traveling radius*" exert their influence in the same ratio as they increase direct contact If the contact by this means is important, it is hard to follow the reasoning that leads the author to ignore the innumerable direct contacts in school

Have we any concrete evidence that points toward the school as a disseminator of disease?

A review of the morbidity statistics for the Commonwealth of Pennsylvania covering a period of thirteen years shows that scarlet fever, for example varies in its monthly incidence in precisely the same way year after year In June there is always a rapid decline in incidence, reaching the lowest level in July or August, followed by a rather sharp rise beginning in September and mounting to its apex in January (as shown in the accompanying chart) Almost the same type of morbidity curve is found for diphtheria Certainly the opening of the schools about September 1 must account for a considerable part of this morbidity rise The only material change in the daily routine of a child during the month of September from that of August is his attendance at school during five or six hours a day In view of the ease with which direct contact can play its role in the school we are justified in concluding that the school does aid very materially in increasing the incidence of disease

I would further point out that the cases which develop as a result of school contact may propagate the disease in the home We see frequently families in which the mother by endless care, has succeeded in protecting her children from these infections until the time comes for the eldest child to enter school There he falls heir to lurking measles scarle

fever or what not, and carries the disease home, where a household epidemic at once results. The cases that develop in the preschool age certainly are directly assignable to the school, and yet the author of "Age and Disease" seems to consider the school as an institution hermetically sealed from the home, and indicates no appreciation of the role which the school plays as a sort of exchange center for diseases.

The last paragraph of the article quoted concludes that the exclusion from school of children above 10 or 12 years because a younger brother or sister has some minor contagion would hardly justify the time lost from school. The "minor contagions" apparently referred to include scarlet fever, diphtheria, measles, whooping cough and chickenpox.

No modifying statements are made which lead us to believe that the author would favor the removal of this older child to an uninfected residence, it is not suggested that he be excluded from school even during the incubation period, nor does it seem to make any material difference whether or not the child is immune to the disease in question. We can therefore only assume that the author recommends that children above 10 to 12 years who are household contacts should be permitted to attend school from the infected household. The possibility of transmission of these diseases by a third person is thereby categorically denied. It does not seem to occur to the author that this child of 10 or more years may become a healthy carrier or himself develop the disease. Yet, in a typical year such as 1915, our morbidity statistics in Pennsylvania show that 25.7 per cent of the 9,860 cases of scarlet fever occurred in the age group 10 to 19 years and that 18.5 per cent of the 14,645 cases of diphtheria occurred in the same age group.

From such an experience I can only see a serious danger threatening the community which would subscribe to the views expressed in 'Age and Disease.'

GEORGE K. STRODE, B.S., M.D., Harrisburg, Pa.
Chief, Division of School Health, Pennsylvania Department of Health

WHY PROPRIETARIES FLOURISH

To the Editor:—The following experiences seem to add one more to the many reasons offered to explain why proprietaries and ready-made preparations flourish at the expense of the official drugs and preparations. A few days ago I prescribed Troches of Ammonium Chlorid, U. S. P., for a patient of exceptional perseverance. The next day he had not yet secured the troches and told me that he had submitted the prescription to seven pharmacies, including the largest, and three of the best known and admittedly the best equipped in New York. All told him that these troches were 'Not being made any more" and that they were therefore unable to supply him. He thereupon communicated with one of the largest wholesale manufacturing pharmaceutical houses in America and received precisely the same answer. I then took the matter up with a first class pharmacist whom I knew and induced him to prepare this difficult (!) troche for which the U. S. Pharmacopeia gives the following directions: "Rub the powders together until they are thoroughly mixed, then form a mass with syrup of tolu and divide."

Seven pharmacists declined to fill a prescription for an official preparation because they could not buy the preparation from a wholesaler, and it required some persuasion to get the eighth to make the preparation. But, even worse, several of the pharmacists offered my patient some ready-made troche more or less closely resembling the official, or offered compressed tablets of ammonium chlorid.

That this is not an isolated example of what often poses as pharmacy is shown by the fact that I have found it extremely difficult to find a pharmacist who would extemporaneously coat pills with gelatin. Most want the physician to alter his prescription so that one of the ready-made gelatin coated pills can be dispensed, if a gelatin coating is necessary. Some gelatin, hot water, a large cork and a few domestic sewing needles are all that is required for very satisfactory coating of pills with gelatin, yet few pharmacists seem willing to perform this simple procedure.

Two other illustrations, not so recent, have come to me from a colleague. A few years ago he was unable to obtain from either of two pharmacists an emulsion of cod liver oil without the hypophosphites because, as both said, "It does not come without hypophosphites." On another occasion four of the best drug stores in Boston were asked for the Compound Laxative Pill, U. S. P., then official in the pharmacopeia. In every case he was told that he must have meant the compound cathartic pill, which in no way resembles the pill he sought.

With this attitude on the part of the men supposed to be serving the public and the medical profession by the practice of pharmacy, is it any wonder that it is difficult to induce the medical profession to prescribe official preparations or combinations of official drugs in place of ready-made commercial substitutes largely drawn from among the proprietaries or specialties? Real pharmacy by real pharmacists is a necessity if we are to succeed in combating the proprietary evil.

CARY EGGLESTON, M.D., New York.

"CREDULITY AND CURES"

To the Editor:—Although I am aware that Dr. Peterson is fully able to defend himself against criticism made of him in his position on psychanalysis by Dr. Kempf in THE JOURNAL (Aug. 7, 1920, p. 427), I cannot refrain from asking you to permit me to take some part in the general discussion.

Dr. Kempf writes: "Through the psychanalytic method of studying the insane we have learned that the most potent cause of insanity is *repressed affective cravings*, and this repressive tendency is started early in childhood, not naturally or through the designs of Nature, but through the pernicious influence of prudish, purblind fathers and mothers, and dogmatic teachers who are obsessed with sexual phobias."

'We have learned' means psychanalysists have learned—for no one else has learned this.

I recall that Gil Blas associated himself with Dr. Sangrado as an apprentice, and under that master he engaged in the practice of bloodletting. The doctor had found this an infallible remedy. When to Gil Blas it seemed to fail in the face of the death of the patient Dr. Sangrado pointed out that the bloodletting had been insufficient and that the death of the patient only showed the method was not sufficiently practiced. And of course when recovery occurred it was recorded as a triumph of this method of treatment. Christian scientists adopt the same method of reasoning. By their method there can be no failure whatsoever when all conditions are favorable and when their plans are completely carried out.

Only in orthodox medicine are failures recorded even when conditions and technic are perfect. One could as little argue with a psychanalyst as with Dr. Sangrado or Mrs. Eddy. There simply is no argument with those who hold this position.

I have read the writings of Dr. Freud and Dr. Kempf and those of many others who adopt the Freudian methods. Being a practicing neurologist it was my duty to do so, and now I do not attempt these methods because they do not appear reasonable. I should not attempt methods which do not appear to me as reasonable and sound and which moreover, appear to me as unlikely or even dangerous. I know of no good results from the Freudian method, but I do know of harm resulting from it.

THEODORE DILLER, M.D., Pittsburgh

NEED OF A PEDIATRICIAN ON THE NATIONAL BOARD OF MEDICAL EXAMINERS

To the Editor —I was very much interested in the last report of the National Board of Medical Examiners It is fair to assume that the primary purpose of their examinations is to determine the fitness of the candidates to practice medicine Therefore it is of more than passing interest that of the eighty questions submitted in their last papers not a single one was immediately concerned with pediatrics

Three may be said to be remotely connected the child of 8 with the spots on the tonsils, the differentiation between varicella and smallpox, and the directions to prevent the familial spread of whooping cough

Is a knowledge of pediatrics necessary to the young practitioner? This cannot be doubted, for, while figures vary a conservative estimate is that one quarter of the patients seen in the first years are infants and children It is doubtful whether there is any branch of medicine about which the general practitioner is more at sea No papers are read with more avidity than those which throw light on the diseases peculiar to infancy and childhood There are more reasons than one for this state of affairs, but the chief reason is the failure of the medical schools to meet the situation

Pediatrics needs no brief Feeding infants properly, training children in personal hygiene cutting down the incidence of tuberculosis and heart disease at the time when they undoubtedly occur most frequently, linking up community work with child welfare, studying the psychology of childhood, especially the abnormal types seen in outpatient departments, hospitals and children's courts and seeking to solve the tremendous problem of the contagious diseases are a few concrete examples of the problems which are presented to the pediatric department of the medical school

Preventive pediatrics is recognized as second to no other branch of preventive medicine This being so, it seems to me that there is a crying need for the appointment of a pediatrician to the National Board of Medical Examiners This will lead to two desirable ends Candidates will know more about the diseases of infancy and childhood, and medical schools will be forced to give courses in keeping with the importance of the subject

LOUIS C SCHROEDER, M D, New York

QUININ AND UREA HYDROCHLORID

To the Editor —Could you tell me why quinin and urea hydrochlorid has not become more popular for local anesthesia? Is it less efficacious or more toxic than other preparations? If it is useful can you name some trustworthy firm or brand? Please omit my name in answering

L F C M D, Mexico

ANSWER —Quinin and urea hydrochlorid has the actions of quinin When injected hypodermically it exerts an anesthetic action much more prolonged than that of cocain' (Useful Drugs, Ed 4, 1920, p 127) It has been pointed out editorially in THE JOURNAL (Feb 14 1920 p 462) that quinin has been regarded for more than half a century by toxicologists as a protoplasmic poison capable of destroying various forms of animal and vegetable cells, and hence it need not be surprising that tissue necrosis may be produced by strong solutions of the quinin salts That this deleterious reaction actually does occur and has mitigated against the general use of quinin and urea hydrochlorid is confirmed by the report of the Committee on the Advantages and Disadvantages of Local Anesthesia in Nose and Throat Work (THE JOURNAL, July 31, 1920 p 315) To quote

> The only local anesthetic that produces edema and sloughing is quinin and urea hydrochlorid So many statements were found in the literature that this anesthetic had been abandoned in other fields of medicine because of edema and sloughing that writers who had presented favorable reports in nose and throat operations were communicated with by your committee One writer who had recorded 390 cases of tonsil lectomies extolling this anesthetic which he had used for four years and is still so recorded now states that he has not used it in two years although no publication has been made retracting his former endorsement Still another writer who stated that quinin urea came nearest the ideal local anesthetic now states that he has ceased using it Your committee finds that as far as nose and throat operations are concerned this drug has practically gone into innocuous desuetude

The anesthesia produced by this drug at the time of operation is good and the recovery of the patient might often be enhanced by its use if it did not have the serious drawback The product is official in the U S Pharmacopeia and may be obtained from any reputable pharmaceutical house

SPANISH MEDICAL REVIEWS

To the Editor —Will you kindly send me the address of Spanish journals similar to the Spanish Edition of THE JOURNAL

M MANAS Havana Cuba

ANSWER —We know of no journal in Spanish corresponding to the Spanish edition of THE JOURNAL

Among the better known medical journals in the Spanish language may be mentioned

Anales de la Facultad de Medicina Montevideo Bimonthly $2
Anales de la Facultad de Medicina Lima Peru Bimonthly 6 soles
Gaceta Médica de Caracas Caracas Venezuela Semimonthly 16 bolivares
Gaceta Médica de México Mexico City Irregular $6
Prensa Médica Argentina Buenos Aires Trimonthly 35 pesos
Revista de la Asociacion Médica Argentina Buenos Aires Monthly
Revista de la Universidad de Buenos Aires Buenos Aires Monthly $5
Revista Espanola de Medicina y Cirugia Barcelona Monthly 24 pesetas
Revista Médica del Uruguay Montevideo Thirty francs
Semana Medica Buenos Aires Weekly $5
Siglo Médico Madrid Weekly 20 pesetas
Medicina Ibera Madrid Weekly 25 pesetas
Progresos de la Clinica, Madrid Monthly 45 pesetas
Plus Ultra Madrid Monthly 60 pesetas

We presume the inquirer is familiar with Cuban medical journals, and therefore none is mentioned from that country

NAPOLEON S REPLY TO MADAME DE STAEL

To the Editor —Will you kindly satisfy my curiosity on the following point? Dr Havne in his article on The Rights of the Child (THE JOURNAL July 17 1920) quotes Napoleon s reply to Madame de Stael She who has borne the most sons for France Is that historical or but a paraphrase of Madame Stael Holstein s reply to Napoleon when in a fit of ill humor he bluntly asked her What have you given to France?' and she quickly replied Three children your Majesty Ou n est pas la femme?

JOHN A WIEMER M D Powers Ore

ANSWER —The statement of Napoleon to Madame de Stael is to be found in Gourgaud (le baron Gaspard), Sainte Helene Journal inedit de 1815 a 1818 Paris Flammarion, 1919 The passage reads

> Jan 18 1816 Napoleon related At a fete at Talleyrand s Mme de Stael seated herself next to Napoleon conversed for two hours and finally asked him abruptly Who is the greatest woman of the past or the present? Napoleon replied She who has or has had the most children '

This is perhaps confused with the statement of Napoleon uttered at St Helena Woman was given to man that she should bear him children (La femme est donnee a l homme pour qu elle fasse des enfants)

AMOUNT OF WINE THAT MAY BE PRESCRIBED

To the Editor —Please advise me how much wine a physician can prescribe to any one patient at any one time F D New York

ANSWER —Internal Revenue Regulation 60 defines liquor as including alcohol brandy whisky rum gin beer ale porter and wine and in addition thereto any spirituous vinous malt and fermented liquor liquids and compounds containing ½ of 1 per cent or more of alcohol by volume Article 12 Section 69 Paragraph B of the regulations provides that prescriptions for any alcoholic medicinal preparations may not be issued for more than one pint of spirituous liquor at a time and that not more than one pint shall be prescribed for the same person within any period of ten days

National Board Recognized in Scotland

In the spring of the present year, several representatives of licensing boards of England and France came to this country as guests of the National Board of Medical Examiners attended one of the examinations and, in a tour through various large cities, visited a number of the medical schools Dr Walter L Bierring, a member of the National Board who accompanied them on the tour, has recently received a letter from one of these guests, Dr Norman Walker a member of the General Medical Council of Medical Education and Registration of Great Britain and a representative of the Triple Qualification Board of Scotland, stating that the latter body had adopted a recommendation that American physicians who hold the certificate of the National Board of Medical Examiners be admitted to the final examination of the Triple Qualification Board

Clinical Teaching "Elements"

The London *Lancet* states that the reorganization of teaching in St Bartholomew Hospital provides for a medical "element' or division, and a surgical element, each of which will take its share in the ordinary duties of the hospital the entire staff of each to work as a single "firm" Each is provided with special facilities for observation and research, and has laboratories for pathologic investigation and routine work These two teaching elements are closely associated with the medical and surgical work of the hospital There is free daily communication between them Certain appointments in connection with the reconstruction of the pathologic department have been announced, including a bacteriologist and lecturer on bacteriology, a lecturer on morbid anatomy and histology and a chemical pathologist and lecturer on chemical pathology Three senior demonstrators are whole-time pathologists and in addition, there are three demonstrators who are part-time pathologists and eligible for posts as chief assistants in one or other of the clinical elements It is proposed that all chief assistants in future shall have previously served in the pathologic department, since one of their functions within the elements will be to superintend the pathologic work of the students These changes in the medical school will make pathology more essentially a part of the clinical teaching

Florida June Examination

Dr William M Rowlett secretary of the Florida State Board of Medical Examiners reports the written examination held at Jacksonville June 14-15 1920 The examination covered 7 subjects and included 70 questions An average of 75 per cent was required to pass Of the 49 candidates examined 36 passed and 13 failed The following colleges were represented

College	Year Grad	Per Cent
PASSED		
Atlanta Medical College	(1915)	84 3

Arkansas Eclectic May Examination

Dr Claude E Laws secretary, Arkansas Eclectic Board of Medical Examiners reports the written and oral examination held at Little Rock May 11-12 1920 The examination covered 12 subjects and included 120 questions An average of 75 per cent was required to pass The 41 candidates examined were all graduates of the 1920 class of the Kansas City College of Medicine and Surgery, and of the 41 20 passed and 21 failed

Book Notices

DIE SCHWEBELARYNGOSKOPIE UND IHRE PRAKTISCHE VERWERTUNG Von Geh Med Rat Prof Gustav Killian Direktor der Laryngo Rhinologischen Klinik der Universitat Berlin Price 60 marks Pp 78 with 48 illustrations Berlin Urban & Schwarzenberg, 1920

Killian gives the history of his discovery of suspension laryngoscopy, describes the instruments he now uses, and and presents his technic in detail for examination of the hypopharynx and the trachea, and for introduction of the bronchoscope In the first chapter he narrates how he rigged up a temporary apparatus for exposure of the larynx in a cadaver so that an artist might make drawings This was so successful that he then devised instruments for exposing the larynx in the living The original instruments have been much modified He now uses the trough shaped spatula for holding up the tongue The mouth gag and tooth hooks are much after the models of Lynch The original form of the gallows is retained His table has a separate support for the head by which it may be raised or lowered independently of the table The table itself may be raised by means of a long screw so that the surgeon may work standing, if necessary Killian uses a Kirstein lamp for illumination and so is able to use the mirror of the lamp for a demonstration mirror, enabling students to see in the mirror what the surgeon sees in the larynx In chapter V he describes in detail his technic of introducing the instrument, and exposing the uvula, the edge of the epiglottis, the arytenoids, the lumen of the larynx, and lastly the anterior commissure The work of Lynch is mentioned, but no description is given of Lynch's method of exposure of the larynx without having the head hanging over the end of the table Figures 37, 38 and 39 are wrongly numbered *They should be 38, 39 and 37, respectively* Chapter IX is given to the use of suspension laryngoscopy in children, a procedure of much value, especially in introducing the bronchoscope There is a considerable list of references to the literature, but naturally few to American literature since the outbreak of the war The work is illustrated by forty-four cuts in the text and four colored plates showing various normal and abnormal conditions The colored plates are a little too blue and appear to represent patients rather more cyanotic than they are seen in America This may be only a result of the war as affecting color printing

LE SYMPATHIQUE ET LES SYSTÈMES ASSOCIÉS ANATOMIE CLINIQUE SEMIOLOGIE ET PATHOLOGIE GÉNÉRALE DU SYSTÈME NEURO GLANDULAIRE DE LA VIE ORGANIQUE Par A G Guillaume Paper Price 6 francs 50 net Pp 160 with illustrations Paris Masson et Cie 1920

In this book, emphasis is laid on the fact that the chromaffin organs are from the standpoint of their development and function closely associated with the sympathetic nervous system, and the cranial, thoracicolumbar and sacral portions of the autonomic system, together with these chromaffin organs, form a closely integrated complex, "le grand systeme neuro glandulaire de la vie organique" Chapter I contains a brief review of the general morphology and physiology of this system, including the histogenesis, anatomic distribution and functional relationships of its constituent elements Chapter II presents some details concerning the conduction paths in the autonomic system The part that deals with the visceral efferent paths associated with the cranial nerves is thoroughly up to date and is accompanied by good diagrams Chapter III deals with the pharmacologic aspects of the subject and Chapters IV and V with symptomatology Chapter VI contains a discussion of the interrelations between the visceral and somatic subdivisions of the nervous system, and especially with referred pain in visceral disease and with reflex trophic disturbances The volume contains little that is new, and some statements that are presented as representing established facts are certainly open to question It makes no pretense of being a thoroughgoing review of recent literature The appended bibliography contains no references to articles representing original investigation, but includes a list of standard reference books and monographs on embryology, physiology endocrinology, pharmacology and neurology which contain sections dealing with the subjects discussed in the book

Medicolegal

Evidence of Malpractice—Use of Fracture Basket

(Wojciechoiski v Corsell (Mo) 217 S W R 638)

The St Louis Court of Appeals, in affirming a judgment in the plaintiff's favor for $3,000 damages for alleged malpractice, says that a sheet of steel fell on his right leg, causing a compound comminuted fracture of the bones and inflicting lacerations or wounds He adduced evidence tending to show that it was negligence to place his leg in a wire basket, or fracture basket, after the setting of the bones, and to allow it to remain there for weeks, instead of putting it in a splint or cast of some character designed to hold the bones rigidly in position unless it could be said, as a matter of law, that the course pursued by the defendant was justifiable because of the condition of the leg or at any rate that because of such condition the defendant's failure to pursue a different course was the result of an error of judgment on his part of such character as would not entail liability under the law As to the condition of the leg at that time the evidence in the plaintiff's behalf tended with much force to show that no infection, or at least none of any considerable extent, or of a serious or dangerous character was present This directly appeared from the testimony of the plaintiff as to the condition of his leg, and inferentially from his testimony corroborated by that of another witness, to the effect that after the setting of the leg the bandage which the defendant placed about the leg and wire basket, which, it was said completely covered the leg no openings being left and no drain pipes inserted was not removed for three weeks or more the leg receiving no treatment during that time From the testimony of the plaintiff and said witness coupled with the expert testimony adduced by the plaintiff, a jury could, with entire propriety find that there was no infection or other condition present such as to make it in any wise unsafe to use some one of the devices shown by the evidence to have been in common use, designed to keep the bones of the leg in proper alinement while they were uniting, and the testimony of the plaintiff's expert tended to show that some of these devices, designed so as to afford opportunity for treating the leg might be used in these cases though much infection might be present The court is of the opinion that the evidence was such as to make the question of the defendant's negligence one for the jury Nor, under the circumstances, does the court think that there was any merit in the contention that under any view of the evidence the defendant was guilty at the most of a mere error of judgment as to the proper treatment to be given the plaintiff's injured leg and could not be held liable for a failure to give a different treatment The court is of the opinion that the evidence, when viewed in the light most favorable to the plaintiff tended to show neglect on the part of the defendant, and that, so viewing the evidence, if there was an error of judgment, it was prima facie of such character as to be inconsistent with the use of that degree of skill which it is the duty of every surgeon under like circumstances, to bring to the treatment of such a case

It was urged that error was committed in admitting testimony tending to show that the defendant failed to use an anesthetic, failed to take more than one roentgenogram did not lance the wound or insert drainage tubes, did not elevate the leg or apply ice bags did not call a consulting physician, and did not inform the plaintiff or his family of the seriousness of his condition as testified to by the defendant The point made was that the petition charged particular acts of negligence, and therefore evidence as to other specific acts was not admissible But the court thinks that no reversible error intervened on this score The testimony complained of was admissible as going to show the character of the treatment, alleged by the plaintiff to have been negligent and unskilful or as tending to show the condition of the leg this having an important bearing on the question as to the alleged negligent and unskilful treatment thereof

Nor was it error to permit the jury to find that the defendant not only failed to use a splint but failed to apply any other method or device to cause said fractured bones to unite

in normal and usual alinement" Under the evidence adduced the jury could properly find that in using the wire fracture basket the defendant did not use a method or device such as to cause the fractured bones to unite in normal and usual alinement

Invalid Provision in Law for Revoking Licenses

(State Board of Medical Examiners et al Lewis (Ga) 107 S E R 24)

The Supreme Court of Georgia holds that Section 14 of the act approved Aug 18, 1913, entitled "An act to abolish the present state board of medical examiners and to establish a composite board of medical examiners for the state of Georgia, to define its duties and powers," etc, is unconstitutional and void so far as it provides for the trial and conviction of a licensed physician of certain specified offenses, and the consequent revocation of his license, as the section, so far as it provides for such trial and the penalty on conviction, is violative of the due process clause of the federal and state constitutions, as no provision is made in the section, or elsewhere in the act, for due notice and hearing of the accused Furthermore, the court holds that where a licensed physician was tried and convicted under said Section 14, and appealed to a jury in the superior court, where he was again convicted, and then sued out a writ of error to the Court of Appeals of Georgia, where the conviction was sustained, he could subsequently attack the judgments of conviction in the superior court and before the board of medical examiners, and, on proper petition to a court of equity, prevent the enforcement of the penalties imposed by the act on conviction

The supreme court says that though in this particular case the accused might have appeared and submitted evidence, that did not cure the defect in the act itself If such a hearing was granted him, it was by grace, and not by virtue of the requirements of the law Nor did the right of appeal to a jury in the superior court cure the defect in the law The statute under which the accused was tried by the state board of medical examiners being invalid and void on the constitutional grounds pointed out the proceedings before the board, which resulted in finding the defendant guilty of certain specified offenses, were nugatory, and the finding was without effect and void, and the appeal and trial before a jury under the provisions of Section 14 could not have the effect of giving validity to the proceedings and findings before the board, nor could the finding of the jury in the superior court on the appeal be treated otherwise than as void as the statute under which the trial was had was itself invalid Nor could the fact that the case was carried to the court of appeals, where the judgment of the court below was affirmed, give validity to the proceedings, or bar the accused from asserting that all proceedings had against him were nugatory

It was urged that even if the principles stated were sound in criminal cases, the doctrine could not be applied to civil cases, and it was insisted that the proceedings against the accused, which resulted in his conviction and the revocation of his license were civil proceedings But the supreme court cannot assent to this proposition in its entirety The result, it was true, did not subject the accused to imprisonment in the chain gang or the penitentiary, and resulted merely in the revocation of his physician's license and the striking of his name from the record kept in the office of the clerk of the superior court But this itself was a penalty, and the proceedings were in the nature of criminal proceedings The proceedings were certainly quasi-criminal in character The language of the section which authorizes the proceedings making it the duty of the board to 'prefer charges against the physician, and providing for the revocation of his license 'in the event of his conviction' by the jury distinctly imports a trial in a criminal case

It follows that the accused was entitled to injunctive relief against the threatened action of the state board of medical examiners, which, if carried out should result in revoking and canceling his license and thereby depriving him of the right to pursue his profession, and it requires no argument to demonstrate that the injury which would thus be inflicted would be irreparable in its character The court below did no err in granting such injunctive relief

Carcinoma of Pancreas—Fifty-two cases of primary pancreatic cancer were analyzed by Speed Over half of these were clinical diagnoses made by the attending staff of Cook County Hospital In the fifty-two cases the average age at the time of diagnosis of primary cancer was 57 years, the youngest 36 the oldest 76 The most constant symptom was cachexia This was present in 90 per cent of the patients at the time of admission and involved a weight loss of from a few pounds to 80 pounds The next common symptom was jaundice It was present in 80 per cent of the cases Pain was the third prominent symptom usually of cardialgic or gastralgic character present in 61 per cent of the cases Personal knowledge on the patient's part of an abdominal tumor mass or its discovery on examination was the next common finding in order, 55 per cent of the patients had a mass either in the liver or some part of the midepigastric region Ascites was present in approximately 20 per cent as was also hemorrhage which occurred in eleven patients, two of the mouth, four of the nose one of the bowel, two in the buttocks and skin and two of the stomach Constipation was mentioned by nineteen patients, diarrhea occurred in but three Edema of the lower extremities occurred in 6 per cent A necropsy was made in eleven cases The head of the pancreas was most often involved in cancer, the body next and the tail least often Not one showed pancreatic calculus Metastases occur usually first in the lymphatic glands around the pancreas and galltract areas The liver, of all neighboring organs is most often invaded

Trypanocidal Activity of Arsphenamin and Neo-Arsphenamin—From the results obtained by Schamberg and his co-workers it is evident that neo-arsphenamin is a safer drug than arsphenamin, even when doses of 1 gm of neo-arsphenamin, which approximates 0.6 gm of arsphenamin in therapeutic activity, are given in the treatment of syphilis there remains a larger margin of safety. The trypanocidal activity of arsphenamin is 1.74 times greater than that of neo-arsphenamin. Accordingly, 0.6 gm arsphenamin equals 1.05 rather than 0.9 gm of neo-arsphenamin in therapeutic activity. The trypanocidal dose (dosis therapeutica) of arsphenamin is 4.56 times less the highest tolerated dose for the rat (dosis tolerata), the trypanocidal dose of neo arsphenamin is 6.35 times less the highest tolerated dose. These results indicate that neo-arsphenamin is a somewhat safer compound than arsphenamin, and that when 1 gm of neo-arsphenamin is administered as the equivalent in therapeutic activity to 0.6 gm of arsphenamin, the margin of safety is even then greater.

Cause of Contraction Waves in Ureter Calculus—It is suggested by Penfield that in the passage of a ureteral stone, trauma and inflammation increase the rate of metabolism in the ureter wall about the stone, a constriction ring results, followed by distention of the ureter and retroperistalsis. This would cause great distention of the renal pelvis and give to renal colic its peculiar rhythmical character.

Leukocyte Count Following Splenectomy—Following the usual drill a cavalryman was seized with faintness, nausea and sudden sharp pain in the left upper quadrant of the abdomen. He was brought to the hospital in a condition of collapse. A definite diagnosis was impossible, but six hours after the onset of symptoms a laparotomy was done with the tentative diagnosis of a ruptured viscus. Hemorrhage in the peritoneum was traced to a small tear in the spleen and the organ was removed. The removal of the spleen resulted in a considerable increase in the total leukocyte count which persisted with much irregularity for over three months. In the early period all types of leukocytes were increased in nearly the same proportion, although a slight increase of endothelial cells was noted at the expense of the lymphocytes. In the intermediate period, both total and differential count showed such marked variation as to render averages valueless but the total count usually was high. In the final period, a comparative equilibrium was reached, with a moderate increase in the total count, due entirely to lymphocytes and endothelial cells while the granular leukocytes showed strictly normal figures. The endothelial cells were constantly increased both relatively and absolutely. The observations on the Arneth index suggest that the increase in the count is at least in part due to the removal of some factor restricting the production of white cells. No eosinophilia appeared during the course of the work.

Serologic Studies on Tuberculosis—Sensitized animal serum having a high titer of antibodies was studied by Nishida and Petroff. It was obtained by inoculation of sheep intravenously with human tubercle bacilli. The titer was 0.0001 c.c. Dead tubercle bacilli or products of tubercle bacilli do not produce as high a titer of antibodies as the living organisms. Complement-fixing antibodies resist heat better than the antibodies for the Wassermann reaction. A temperature of 60° C. will not destroy the tuberculous complement-fixing antibodies obtained in experimental animals. Roentgeon-ray radiation when a full erythema-producing dose is given does not destroy the antibody, antigen or complement. Ultraviolet rays destroy the antibodies and complement but have slight effect on the antigen. Sunlight at 1,600 feet elevation has a slight effect on antibodies, more on complement and least on antigen. Complement-fixing antibodies are colloids. They are not lipins chemically, but are either globulins or are absorbed by the globulin. The precipitins and complement fixation have been studied parallel with each other. The two antibodies responsible for the two different reactions are probably the same but represent two distinct phases of one and the same phenomenon.

Tuberculosis in Germany—An investigation of the tuberculosis situation in Germany particularly in the area occupied by the American Army was undertaken and the findings are reported by Bruns. The German methods of combating tuberculosis are about the same as those employed by the best state health organizations of our own country. In the area occupied by the American Army tuberculosis is slightly more prevalent and the death rate relatively higher than that of Prussia. Tuberculosis in all its forms and for all ages has markedly increased during the war. Of all the etiologic factors entering into this increase the shortage of food is most important. Undernourishment, overwork, the stress and strain of a long war and unfavorable environment prepare a fertile soil for the tubercle bacillus to flourish in all its glory. Tuberculosis patients are dying because they cannot obtain the proper nourishment so essential to the treatment of their disease. Those infected are becoming clinically tuberculous. Unquestionably the children of the poorer classes in the cities and the sick are suffering as a result of the shortage of food and should be the first to receive relief. The increase in tuberculosis is relative to the shortage of food and improvement of the food supply is necessary for its reduction.

*Mesenteric Thrombosis: Report of Six Cases. G. G. Ross, Philadelphia.—p. 121.

Prevention of Postoperative Pulmonary Thrombosis—Ochsner and Schneider believe that in the future it will be justifiable systematically to add the transfusion of 600 c.c. of whole blood to the preliminary treatment in a considerable proportion of cases belonging to a class which has in the past made up the list of deaths from pulmonary thrombosis and that the other precautions will be carried out with greater care. It is likely that this will result in a considerable reduction in the death rate from postoperative pulmonary thromboses. An analysis regarding the etiology of the thrombophlebitis as shown in eight tabulated cases is given.

Ulcer of Stomach and Duodenum—From July 1, 1914 to July 1, 1919, 647 operations were performed in the Mayo Clinic on 638 patients with gastric ulcers with an average operative mortality of 4.7 per cent. All patients who died in

the hospital following operation are statistically classified as having died from operation, without regard to the cause of death or length of time after operation During this same five-year period 2,734 operations were performed on 2,720 patients with duodenal ulcers, with an operative mortality of 1 2 per cent In twenty-eight of the series of 638 gastric ulcers the ulcers were multiple Five hundred and thirty-four were located on or around the lesser curvature of the stomach, eight-five involved the posterior wall, nine were on or around the greater curvature, five were on the anterior wall, and five were not located exactly because of the emergency nature of the operation

Pain Symptom in Mesenteric Thrombosis—In the five cases which Ross reports pain was a prominent symptom as it is in every acute intestinal obstruction In Case 1 the patient was taken sick ten days before admission with a severe attack of abdominal pain in the region of the umbilicus, and then becoming general throughout the abdomen Similar (?) attacks had been noted for fourteen years prior to admission In Case 2 the attack began suddenly, with abdominal pain, nausea, and vomiting In Case 3 the chief complaint was pain over the whole abdomen It is described in detail in the history as beginning seven days before admission as an epigastric pain of gradual onset, becoming worse three days after the beginning of the pain In Case 4 the illness was described as beginning two days before admission with pain in the right lower abdomen, soon followed by vomiting In this case the pain remained localized in the right lower abdomen In Case 5 the patient was seized with a severe pain in the epigastrium It is evident then, that in all five cases a very definite history of pain is an early symptom, in only one of the instance described as of gradual onset

*Simple Method for Recording Changes in Cutaneous Sensibility L Feimer, New York—p 81

Hysterical Muscle Contractions—Laboratory evidence is brought forward by Cobb that the involuntary muscular contractions in hysterical conditions are physiologically similar to normal conscious muscular contractions The short, repeated, hysterical contractions that clinically resemble tremors can be differentiated electromyographically from such a tremor as that of paralysis agitans, or from clonus, by their slower rate and greater irregularity

Double Spinal Cord—External examination showed no abnormalities in the case reported by Lipshutz On opening the dural sac, however, the spinal cord was found divided in its caudal portion into two distinct symmetrical halves, the two entirely enclosed in a single dural sheath Similarly, the arachnoid stretched across as a single membrane The bifurcation began at the caudal border of the eleventh thoracic vertebra and extended to the caudal limit of the cord, forming two independent symmetrical halves The caudal limit of each half was at the level of the cephalic border of the first sacral vertebra The conus medullaris of each half was independent and at the level of the third sacral vertebra, the halves united into a single large filum terminale, the latter coursing caudally for a distance of 5 cm to gain attachment to the dorsal surface of the first segment of the coccyx The cervical and thoracic portions of the cord were normal in appearance The peripheral nerves cephalic and caudal to the bifurcation presented no variations in the formation of the different plexuses and in their normal peripheral distribution The inner surface of the dura at the level of the caudal border of the twelfth thoracic vertebra likewise showed an interesting and rare anomaly Where the division of the cord was total, a distinct band of dura was found projecting between the two halves of the cord The band of dura was directed ventrodorsally and had a first attachment of 1 cm on both the ventral and dorsal surfaces of the dura It was of an hour-glass shape and was placed in the sagittal plane This band or fold was clearly a part of the dura, being of the same texture and consistency In the unopened dura it seemingly caused no pressure on the halves of the cord The division of the spinal cord began 0 5 cm cephalic to the dural band noted above

Acute Radicular Epidemic Encephalitis—Five cases are reported by Pardee, but as all the patients recovered, only a clinical study could be made The chief symptoms were (1) sharp lancinating root pains, (2) paresthesia, (3) muscular spasms, (4) hyperesthesia, (5) delirium, and (6) fever

Pernicious Anemia Mistaken for Arteriosclerosis—Jones and Raphael suggest that probably more cases of pernicious anemia are mistaken for arteriosclerosis than are generally recognized Therefore, they advise that patients with doubtful cases of arteriosclerosis, especially those with a history of remissions, should, as a routine procedure, have frequent blood counts made, and neurologic examinations for cord changes Careful history taking may reveal the so-called "prepernicious" symptoms in cases that otherwise might be mistaken for arteriosclerosis

Path of Faradic Sensibility—The evidence collected by Grabfield has been largely gathered from a study of cases presenting certain neurologic lesions or psychiatric conditions, and suggests that faradic stimuli of liminal value probably follow the path of the thermal fibers, while markedly supraliminal stimuli may use other paths The postrolandic cortex is in all likelihood the arrival platform for these impulses

Recording Cutaneous Sensibility—Feimer describes charts used by him and others to record changes in cutaneous sensibility and which can be interpreted easily

Formication Test of Nerve Injuries—Tranter maintains that the formication test gives definite evidence of regeneration long before muscle reflexes appear or before voluntary motion becomes possible It frequently tells when a suture has been unsuccessful, as may happen when the ends pull apart after having been sutured under some unavoidable tension It often indicates the position of a neuroma under a long scar and helps in locating the nerve ends at operation and in telling whether a suspicious palpable mass is a neuroma or not, or in revealing a second unsuspected lesion, and finally, it is of great value in helping to keep up the morale of the patient during the long period before the reappearance of voluntary motion

Relation of Hernia to Military Service W W Grant Denver —p 190

Simplified Infant Feeding—The salient features of the method recommended by Gengenbach are first, boiling the milk, second, a method for determining the amount of each feeding, and, third, a method of calculating the amount of each ingredient in the feeding Knowing that many infants cannot at the beginning digest cow's milk very well, it is suggested that the feedings at first should contain only 1 ounce of whole milk for every pound of body weight, and that this amount be later gradually increased to 1½ ounces An infant, 3 months old, weighing 10 pounds, requires 450 calories in daily feed On a three-hour feeding schedule it is to receive usually seven times 4 ounces, or 28 ounces Of this amount, 10 ounces are to be in the form of whole milk, and the other 18 ounces in plain or cereal water These 10 ounces of whole milk (from 20 to 21 calories to the ounce) represent about 200 of the 450 calories required The remainder are furnished by the carbohydrate added, either sugar alone, or sugar and starch, the latter in the form of a cereal dilution When tolerated cereal dilutions are preferable Barley water is ordinarily used for this purpose, using three level tablespoonfuls of barley flour or two rounding tablespoonfuls of pearl barley to a quart of water The 18 or 20 ounces to be used represent about 60 calories The remaining 190 calories are provided in the form of sugar, and as 1 ounce of table sugar, represents 120 calories, and 1½ ounces of sugar to the day's feeding

*Fright as a Cause of Epilepsy and How It Acts E A Tracy Boston —p 221
Case of Complete Amenorrhea with Fulminating Symptoms Surgical Demonstration of Ovarian Etiology C Dederer Bay City Mich —p 229

Operations on Hypophysis—Beck says that except for the fact that operations on the hypophysis are fraught with considerable danger, the mortality rate being from 10 to 16 per cent, the indications for surgical treatment of disease of this gland would be practically comparable to those for diseases of the thyroid The complete removal of the gland or any process which totally destroys the substance will lead to the condition known as cachexia hypophysopriva, operations, therefore, are restricted largely to tumors and are resorted to more frequently in conditions associated with hyperfunction

Conversion of Parathyroids into Thyroid Tissue—The series of experiments reported on by Vincent and Arnason do not lend support to the view that parathyroids left behind after thyroidectomy become converted into thyroid tissue.

Fright as Cause of Epilepsy—It is maintained by Tracy that severe fright can produce idiopathic epilepsy in a child without a predisposition to the disease It acts by causing a hypertonia of the sympathetic nerves A hypertonia of sympathetic nerves was the evident beginning of the disease in a case reported

Relationship Between Amenorrhea and Ovary—A case is reported by Dederer in which a patient suffered from amenorrhea for about fourteen years following the surgical removal of parts of both breasts, for reasons not now known Sectioning of the sympathetic nerves to the ovaries and resection of the adventitia of the ovarian vessels was followed by the establishment of normal menstruation

Transverse Colon Incarcerated in Hernia Sac—Royer's patient gave a history of stomach and bowel trouble dating back twelve or fifteen years He had no gastric or intestinal symptoms but complained of a feeling of distress in the left side of his abdomen in the left lumbar region He said there was something in there that would not let the food pass out of his stomach He had no constipation, yet he said the stool was very small At a variable time after eating this distress would come on and he would have to use an enema to obtain relief For some time past he had been using rectal dilators nearly every morning, and thought they were a great help His trouble was attributed to his work i e lifting and carrying heavy articles He also mentioned that he had a small lump in each groin one of which he had had for several years while the other had appeared within the past year Roentgen examination of the gastro-intestinal tract revealed a transverse colon apparently markedly dropped and manipulation was attempted to ascertain the degree of mobility Instead of displacing the intestine upward as anticipated, it was found to be firmly bound down behind the pubes On digital examination bilateral hernias were found At the end of a week another barium meal was given to study further the incarcerated colon and to determine accurately the degree of stasis present. At the twenty four hour period, instead of finding the expected condition the transverse colon was in a practically normal position with no evidence of the hernia The small bilateral hernial sacs were repaired The case emphasizes the advisability of a second examination for verification where uncommon conditions are found

Treatment of Epidemic Encephalitis—The use of frequent spinal drainage and the employment of hyperosmotic solutions intravenously in elevated instances of epidemic encephalitis are advocated by Hoffman as an addition to our therapeutic armamentarium

Leukoplakia of Kidney Pelvis and Ureter—Leukoplakia of the pelvis of the kidney and ureter is regarded by Richey as being a pathologic entity which seeks logical explanation on the basis of true metaplasia, entailing a transformation from the normal transitional epithelium, even presenting a superficial laver of keratin It would appear that the absence of a demonstrable membrana propria, plays an important role in the metaplastic process by permanently altering the environment of the lining cells The loss of the basement membrane is the outcome of repeated insults wrought by long continued trauma, either inflammatory, mechanical or both It is possible that a certain number of cases of pyelitis are refractory to appropriate treatment as a result of leukoplakia of the pelvic mucosa As in the buccal cavity, bronchi, esophagus, gallbladder, urinary bladder, prostate, fundus uteri and elsewhere, leukoplakia of the renal pelvis and ureter may be a potential site for subsequent malignant metamorphosis

Studies on Blood Sugar—The general subject of blood sugar and the values for blood sugar and diastatic activity in normal individuals, diabetics, nephritics, and endocrine cases are discussed by Myers

Prevalence of Influenza Bacillus—Observations were made by Arnold on the prevalence of *B influenzae* in average normal throats, in cases of acute rhinitis, and in throats of patients suffering from "influenza'—which was epidemic in Nashville Tenn in February, 1920 Avery's sodium oleate method was used Of eighty apparently normal throats examined, twenty-eight were positive, making 35 per cent carriers of *B influenzae* Of forty-five cases of acute pharyngitis and rhinitis examined, thirty-five were positive, making 77 7 per cent positive One hundred and four cases were selected at random from cases diagnosed as influenza" in the acute stage Ninety were positive, making 87 5 per cent positive *B influenzae* in nasal secretions from acute rhinitis, directly exposed to the air, are not viable if planted on artificial culture medium after ten hours, if exposed to light, but desiccation being prevented they are viable for twenty-four hours anyway

Psychology of Hallucinations—On the basis of laboratory psychology Gosline says that all mental functions can be reduced to the simple processes, sensation association, reaction and inhibition On the basis of this psychology the hallucinations are reduced to simple processes and the results are correlated with the anatomy of the nervous system Psychology is carried into psychopathology for the purpose of making anatomic localizations Gosline attempts to conclude from the patient s symptoms as to whether the pathologic process is an irritative one or a destructive one

New Method of Alkalimetry—Rieger describes in detail a method of alkalimetry which he says gives promise of service in the early stages of acidosis, the prognosis of the more severe grades and the early recognition of impairment of renal function

Anesthetic Value of Saligenin—From all the facts presented by Hirschfelder and his associates, it would appear that saligenin represents the least toxic or irritant and best anesthetic of all the phenylcarbinols thus far studied by them, that it is many times less toxic than procain, apothesine and similar anesthetics, and that it is well suited for use in practical surgery Although weak solutions of saligenin are devoid of anesthetic effects the epithelial mucous membranes, strong solutions exert a definite numbing effect This is especially marked when freshly prepared 12 per cent solutions are used When a 12 per cent solution of saligenin is applied to the mucous membranes of the mouth or nose, a definite dulling of sensation results

Action of Arsphenamin on Circulation—The mechanism of the action of arsphenamin on the pulmonary circulation, and its relation to the other circulatory effects produced by arsphenamin was studied by Smith Experimental data on the toxicity of arsphenamin following continuous intravenous injection of various preparations into dogs are also presented A few preliminary observations relating to the chemical behavior of arsphenamin toward serum are discussed, and the relation of this to the circulatory phenomena produced by this drug is pointed out The rise in pulmonary pressure produced by intravenous injections of arsphenamin is shown to be due to an obstruction of the pulmonary vessels The nature of the obstruction is chiefly mechanical blocking, or to a constricting action of the pulmonary vessels, depending on the amount of alkali used in making the solution The cardiac dilation following the intravenous injection of arsphenamin does not appear to be a direct effect of the action of the drug but rather secondary to the pulmonary obstruction causing the right heart to work under undue strain and secondarily, to dilate

Action of Epinephrin on Cardio-Inhibitory Center—Bush states that epinephrin does not seem to exert a registrable influence on the cardio-inhibitory center of the striped turtle

Tyramin as Morphin Antagonist—The respiratory stimulants commonly employed to antagonize morphin depression (caffein atrpin scopolamin, narcotin, etc), Barbour and Maurer claim do not posses the advantage of ecbolic action which is exhibited by tyramin Tyramin (from 1 6 to 20 mg per 100 gm) antagonizes the respiratory effects of morphin (from 1 to 1 8 mg per 100 gm) when the two are injected in the same solution The most complete antagonism was noted when 1 mg of morphin was injected with from 6 to 20 mg tyramin the average maximum decrease from normal volume amounting to only one fifth Simultaneous injection of morphin and tyramin in separate subcutaneous regions results in a greater exhibition of respiratory depression than when the drugs are given in the same solution but this is followed promptly by an unusually marked antagonism To account for all of the results obtained it appears necessary to assume both a nonacid and an acid factor in the stimulating action of tyramin

Traumatic Chest Surgery R E Balch Kalamazoo, Mich—p 369
*Sphenopalatine Ganglion Headaches R A Barlow, Rochester Minn—p 371
*Case of Wound Diphtheria G J Curry, Flint Mich—p 376

Sphenopalatine Ganglion Headaches—The twelve cases cited by Barlow show that there is ample evidence to demonstrate the existence of a sphenopalatine ganglion syndrome and to distinguish it from the so-called migraine headache The results of treatment in thus type of headache are sufficiently encouraging to warrant its study and investigation Barlow believes that eventually a form of operative treatment will be developed such as is now used in the gasserian ganglion cases, which will offer more complete and permanent relief In the meantime, by conservative measures many patients can be relieved whose suffering may even result in an economic loss to society

Wound Diphtheria—In Curry's case, the condition developed in a suppurating wound following the excision of the right fibula for chronic infective osteomyelitis, of twenty years' standing Eighty-one days elapsed from the time of the first positive culture until the last negative one, the first fifty-six days of this period being the active stage of the disease

Intestinal Indigestion in Children—In this paper is presented a review of the histories of ninety-six children, ranging in age from 6 to 12 years The chief symptoms in all of these cases pertained to the gastro-intestinal system In none was there any organic disease The outcome of the cases verified the conclusion that perverted function, what might be termed functional pathology of the digestive organs, was the cause of the symptoms Among the predisposing causes mentioned by McClanahan, are heredity (in twenty-four cases in this series there was a history of some nervous condition in one or both parents), home conditions and the habits of the child also figure in the etiology Contributing factors are tonsils and adenoids, diseased teeth an excess of the acid type of foods in the diet, and anatomic conditions Treatment along common sense lines as suggested by roentgen-ray findings resulted most satisfactorily in probably 90 per cent of the cases McClanahan insists that a thorough examination of the child be made before treatment is begun In the diet he has included the cereals, milk, meat only once a day, potatoes, rice and tapioca and such vegetables as parsnips, carrots, beets, cauliflower, squash, lettuce, celery, fruit, both cooked and raw The diet is varied with the individual case Tea and coffee are not allowed Intelligent cooperation of the mother, good will and obedience of the child are aids in carrying out proper treatment Plenty of sleep and rest are also essential Drugs have an important place in the treatment, but often they are used to excess For the relief of constipation McClanahan gives the following powder once a week, resin podophyllin, 1/10 grain, rhubarb, 2 grains, sodium bicarbonate, 5 grains This is given at bedtime, and the following morning before breakfast a cathartic is given, usually sodium sulphate in hot water A little lemon juice added to this will make it more palatable When the stools were hard, liquid petrolatum was of advantage in fifteen cases, in five it produced no result Another cathartic is a combination of equal parts of fluidextract of senna and aromatic cascara, from one-half to one teaspoonful, at bedtime In cases of meteorism, milk of magnesia, ½ ounce at bedtime, is of apparent benefit A bitter tonic after meals has given good results or tincture of nux vomica alone In cases complicated by secondary anemia, Blaud's pill, 3 grains, morning and night is of value In three cases with considerable abdominal distention associated with pain, the abdominal binder gave decided relief

Antiscorbutic Vitamin in Canned Tomato—Canned tomato, Hess says, is the most serviceable antiscorbutic for artificially fed infants It is well borne, comparatively inexpensive, and is available Canned tomatoes may be regarded, from a nutritional standpoint as a palatable solution of the three vitamins Hess recommends it unreservedly in doses of 1 ounce a day By substituting it for orange juice a great saving has resulted

Fat-Soluble Vitamin in Butter—About 0.1 gm butter fat fed daily in addition to an otherwise adequate diet Mendel says suffices to enable rats to reach adult size before they show symptoms of nutritive decline that are remediable by further increments in this supply of fat-soluble vitamin With feeding results were even more favorable, incipient decline being averted until a later period Even more striking have been the results with dried tomato which served, in daily doses of approximately 0.1 gm, as the source of fat-soluble vitamin in a period of fourteen months within which the animals rapidly grew to large adult size These illustrations indicate the relative richness of some of the edible vegetable products in fat-soluble vitamin

Psychology of Special Senses—Cutaneous sensibility and cutaneous anesthesia are the topics taken up by Hurst in this lecture Apart from actual hysterical symptoms there are no underlying physical or mental symptoms or group of symptoms which precede and accompany them and persist after their disappearance, to which the term hysteria can be applied It is clear, therefore, that while it is easy to define hysterical paralysis and hysterical anesthesia, "hysteria' cannot exist in their absence The only possible definition of hysteria is 'the condition in which hysterical symptoms are present," hysterical symptoms being in turn defined as "symptoms which result from suggestion, and are curable by psychotherapy", hysteria is thus a condition in which symptoms are present which have resulted from suggestion and are curable by psychotherapy The subject is discussed fully and amplified by case reviews

Nerve Symptoms in Acute Infections—The mechanisms, physiologic and histologic, by which nerve symptoms in acute infections are produced are discussed by Horder Nerve symptoms arising as part of the interaction already referred to are directly referable to one or more of three different processes by which the nervous system becomes implicated (1) by toxemia, (2) by infection of the meninges, (3) by infection of the nerve tissues themselves In the first of these three mechanisms the nerve symptoms manifested by the patient are chiefly 'functional' in origin, in the second and in the third of these mechanisms the symptoms are chiefly 'organic' in origin The great significance of these mechanisms lies in this distinction The mechanism of toxemia is the one operative in diphtheria and tetanus in the great majority of cases It is also that by which nerve symptoms arise in most cases of pneumonia typhoid fever, scarlet fever and rheumatic fever Secondary infection of the meninges occurs not infrequently in pneumococcus infection and is relatively more common when the primary infection occurs in the middle ear In measles the nerve symptoms are usually toxemic, but the specific virus, though it causes meningism not infrequently, rarely causes a true meningitis That it occasionally sets up an encephalitis or a myelitis, however, has been long recognized In mumps an actual inflammation of the central nerve structures sometimes occurs, and recent experimental work suggests strongly that the virus in this disease has group affinities with the causative virus or poliomyelitis It is possible that the virus of infantile cholera has similar affinities In generalized tuberculosis the mechanism of encephalitic as well as meningitic involvement may be added to that of a toxemia In cerebrospinal fever the meningococcus attacks the pia arachnoid in primary fashion, and this is by far the chief mechanism of production of the long series of symptoms presented in the disease In poliomyelitis and in encephalitis, be the virus identical or only possessed of group affinity, the primary infection is in the central nervous system itself, through intimate vascular infiltration The nerve symptoms present in influenza, though protean in nature, are probably due, in the main, to a toxemia, which may be of any degree from mild to intense, meningism is not uncommon, meningitis is rarely present

Mobility of Cord in Cancer of Larynx—Of forty-four cases analyzed by Thomson the affected cord was quite mobile in twenty-seven In the remaining seventeen cases its movements were more or less impaired, the degree varying from mere sluggishness to complete fixation In three of these latter cases the effect in movement developed while the cases were under observation It was only possible to remove a satisfactory portion of growth before operation for microscopic examination in ten out of these forty-four cases But it is noteworthy that in eight of these ten cases the cord moved freely Concluding Thomson says that impaired mobility of a cord is not a necessary or frequent symptom of intrinsic cancer of the larynx It is, in fact, only met with in a minority of cases presenting themselves for diagnosis It is more apt to be met with in an early case when the growth is embedded in the cord or growing into it than in a distinctly sessile or even pedunculated tumor It is also more usual with growths situated on the inner surface or the subglottic area than with those seated on the upper surface of the cord Otherwise, fixation indicates an advanced case When present it is a very valuable symptom in distinguishing a malignant from an innocent tumor It is of little value, and may even be misleading in diagnosing a malignant growth from a tuberculous or syphilitic deposit As regards prognosis, it is an unfavorable symptom

New Organism Discovered by Symbiotic Growth—Four strains of *B tuberculosis hominis* and one strain of *B tuberculosis* (bovine) were grown by Thompson on large tubes of glycerin-brain agar for one month, after which time sufficient glycerin-veal broth was added to cover the growth, and inoculated with *B proteus* In all the mixtures a diphtheroid organism was observed at the end of ten days Yeastlike odor is apparently characteristic of this remarkable phenomenon as it was noticed in all the tubes Furthermore, the dense turbidity due to the growth of *B proteus* had disappeared on the formation of this new organism Subcultures made on surface agar showed no growth at the end of seven days the proteus having died out In stab glucose agar, inoculated from the mixture, a growth was observed at the end of three days, which was strictly anaerobic The growth was a compact one starting about half way from the surface of the glucose agar On microscopic examination it was found to be the diphtheroid organism observed in the mixtures Morphologically and culturally this organism is identical with the acne bacillus Thompson suggests that his experiments show that the acid-fast organisms and the streptothrices are closely related

Phenomena with Reinjection of Serums—Pehu and Durand analyze seventy eight cases in which the antiserum or antitoxin had been reinjected within three months and forty-two in which the interval was longer comparing them with others on record Darre has applied to intraspinal serotherapy the Besredka method of a preliminary small dose waiting from one to three hours before the main injection They emphasize however, that this protects only against the immediate phenomena the nervous or cardiovascular shock It does not protect against serotoxic eruptions and edema These are liable to occur after any injection first or second and the hypersusceptibility may long persist The serotoxic reactions are usually harmless

In their experience preexisting heart symptoms did not afford any predisposition to cardiovascular shock, and the serotoxic symptoms were not reenforced The reaction to the first injection is no criterion as to what the reaction to the second will be the route for the injection seems to be the preponderant factor, especially the intraspinal and intravenous routes In two of their cases there was intense cardiovascular shock in less than two minutes after the second injection, in the child of 4 a preliminary intraspinal injection of 0 5 c c had been given followed in half an hour with 1 c c The collapse was alarming but two hours later 10 c c of the antiserum was injected without incident The child died ten days later the meningitis having flared up anew In the other case 2 c c had been injected by the vein and the symptoms of severe collapse and shock subsided in two hours and the child recovered Three other children of 2 and 4 died after the reinjection given nearly five six and nine weeks after the first Necropsy showed nephritis in two, a large thymus (15 gm) and small cheesy focus in the right lung in the other Horse antitoxin had been used first and, for the second injection, goat serum from the renal vein, possibly crossed anaphylaxis might be incriminated In conclusion they report success with Mery's method of repeating the injection weekly, whether there are other indications for it or not thus warding off the development of anaphylaxis They gave the weekly reinjections subcutaneously and no phenomena followed but this method is applicable only when the second injection can be made during the weeks immediately following the first If acute nervous or cardiovascular shock develops the fluid injected into the spine can be withdrawn Epinephrin in cardiovascular shock has often rendered valuable service

Ether Treatment of Pneumonia in Children M La salle—p 414
Amyotrophy in Infant from Shell Concussion P Haushalter and P Kahn—p 423

The Fiction of the So-Called Alimentary Test as Guide in Infant Feeding—Terrien presents arguments that the alimentary test—the reaction to cow's milk when the amount is increased watching whether the infant gains or loses in weight and thrives—is far from being a reliable guide to the proper food for the child The fact that the child is unable to digest unmodified cow's milk does not prove that it cannot digest other foods

Ether Treatment of Bronchopneumonia in Children—Lasalle recalls that this disease is nearly always secondary to a pathologic state measles whooping cough influenza etc and that the infection spreads in two different ways causing the common or the suffocative variety according to whether the infection is direct or caused by embolization of the septic agent He compares the evolution of bronchopneumonia to that of a furuncle and points out the striking analogy between these two processes the main difference being the medium in which the infection acts The treatment of a furuncle after incision being asepsis he conceived the idea of treating bronchopneumonia with ether to realize asepsis and obtained wonderful results The injected ether leaves the body through the lungs and being a powerful disinfectant is capable of impairing the vital conditions of the microbes in the lungs Unlike oxygen ether enters everywhere its action is (1) anti-infectious (2) anti-thermic (3) anti-spasmodic and (4) toni-cardiac while it is harmless The result depends less on the quantity than on the moment of the injection the earlier it is made the better Generally 1 c c every four hours will do sometimes even only morning and night Often one injection is enough The treatment of bronchopneumonia should thus be first ether then heart tonics and then revulsion with mustard He reports some typical cases to show the benefits of this treatment and states that he never witnessed any injurious by-effects in his more than 200 injections of the kind

Bulletin de l'Academie de Medecine, Paris

June 29 1920 83 No 26

*Common Origin of Varicella and Zona A Netter—p 588
*Splenectomy in Hemolytic Jaundice H Hartmann—p 599

Common Origin of Varicella and Certain Cases of Herpes Zoster—Netter has compiled from the literature fifty nine cases in which herpes zoster was followed by chicken pox in the contacts and ten cases in which varicella was followed by cases of herpes zoster This connection between varicella and zona was evident in three cases in his service Several cases of one of these diseases developed after a case of the other with scarcely a possibility for contagion from outside The intervals were about the same as the intervals with varicella In sixteen of the cases the two diseases ran their course in the same person almost simultaneously The eruption which sometimes develops along the course of herpes zoster resembles closely that of varicella

Splenectomy in Hemolytic Jaundice—In Hartmann's case the patient and a brother had both presented hemolytic jaundice since childhood and the spleen was extremely large On exposure of the spleen to the roentgen rays pains developed in the region but after splenectomy not only the pains but also the jaundice disappeared in two days In two other cases the erythrocytes numbered only 1 200 000 and 1 870 000 but the blood picture rapidly improved after splenectomy This group of three cases is the first to be published in France he says in which the outcome was a great success In the discussion that followed Vaquez related that he was the first to remove the spleen for hemolytic jaundice with splenomegaly (1907) but his patient died and he was severely criticized for his reckless interference

Oculopilomotor Reflex J A Sicard and J Paraf—p 676
Silent Abscess in Frontal Lobe G Guillain and F Lalert—p 691

Oculopilomotor Reflex—Sicard and Paraf relate that slight rubbing or pinching of the intercostal region may be followed by a pilomotor reflex in the arm on that side if gooseflesh is easily induced This positive reflex can be arrested by compressing the eyeballs This inhibiting reflex seems to be constant but the pilomotor positive reflex is variable and inconstant even in the same person It shows that compression of the eyeballs may have multiple and varied effects

not only on the pneumogastric, slowing the heart rhythm—the oculocardiac reflex—but also on the sympathetic, inhibiting the pilomotor reflex There are also the oculopolyuric reflex the oculoglycosuric reflex and the oculo-albuminuric reflex These reflexes generally occur dissociated in different subjects and they must not be taken too seriously in differential diagnosis

*Diagnosis in Psychiatry M. Laignel Lavastine —p 441
*Incision of the Cervix to Promote Delivery A Schwaab —p 443
Mineral Waters and Anaphylaxis J Galup —p 445

The Diagnosis in Psychiatry—Laignel-Lavastine comments on what he calls the picturesque phase of mental disease, that is the phase in which the painter portraying the attitude, the costume and the reactions to the environment shows at a glance the nature of the mental disturbance The picturesque the psychiatric and the biologic diagnosis have to be considered in turn and in the proper perspective and he relates four typical cases to demonstrate how this should be done "proceeding from the picturesque reaction to the syndrome the affection, and the malady" One of his examples is that of an unmarried woman interned at the request of her physician, the object of her erotic persecution The perspective diagnosis was erotomania in a hypomaniac from hyperthyroidism resulting from acute articular rheumatism at the age of 24 As a rule, however, psychiatry, as well as internal medicine, rests on the tripod alcoholism, tuberculosis and syphilis

Incision of the Cervix to Promote Delivery—Schwaab recommends lateral rather than median incisions, and states that the only one of his seven patients treated in this way who had developed fever was already febrile when the cervix was incised He declares that this method for rapid dilatation of the cervix is no more dangerous than other emergency procedures for the purpose, and has a well defined place in obstetrics

July 7 1920 **28**, No 46

Ear and Throat Complications of Typhus A Costiniu —p 453
*Mental Disturbances in Syphilitics A Barbe —p 454

Mental Disturbances in Syphilis—Barbe reviews extensive literature on this subject, and reiterates that there is no special type of psychoses peculiar to syphilis It has only recently been recognized that syphilis, like any infectious disease can induce mental disturbances, besides those of general paresis The true toxic-infectious syphilopsychoses are those of the secondary period, traceable to the meninges They usually appear about the fortieth day after the primary lesion and the onset is sudden, like a toxic delirium Loehe has reported a case of jacksonian epilepsy coma and death, three months after infection, and hemiparesis has been observed and one case of hemiplegia is on record, but there is nothing characteristic about the mental confusion or toxic psychosis of this phase except the improvement under specific treatment

*Grave Anemia with Uremia C Aubertin and J Yacoel —p 461
*Vertigo M Vernet —p 462
Glioma of Nasal Fossae Anglade and Philip —p 464

Severe Anemia with Chronic Nephritis—Aubertin and Yacoel relate that the anemia was so grave in some of their eleven cases of nephritis with uremia that it masked the causal kidney disease as also in one of six cases without uremia There was a tendency to edema in only four of the total seventeen but the polynucleosis averaged 80 per cent although the leukocyte count was generally normal and there were no secondary infections to explain it The marrow seemed to be incapable of replacing the destroyed corpuscles and hence the evolution of this grave anemia was rapid In two cases described in detail, the girl of 21 and man of 27 died in six and eight months after the first symptoms The anemia seems to be usually the work of the uremia and fluctuates with this

Epinephrin in Treatment of Vertigo—Vernet remarks that hitherto little has been done to combat the primal cause of vertigo which he defines as a loss of vasotonic balance in the internal ear from disturbance in the sympathetic nervous system We have in epinephrin he says, a means to restore the balance as it stimulates the nerve terminals regulates the blood pressure and has an antitoxic action In the last four years he has thus treated large numbers of patients, giving from 5 to 20 drops of the 1 1000 solution of epinephrin twice a day suspending it for a time after ten days then resuming Old and advanced lesions of the cochlea were not benefited in some cases drugs to act on the vagotonia were found useful adjuvants He regards this endocrine treatment as more promising than any other yet known

*Inorganic Motor Disturbances M Briand and A Rouquier —p 473
Pains Like Electric Shock Consecutive to Trauma of Back of Neck R Dubois and J Ribeton —p 474
*Nature and Treatment of Diabetes F Farges —p 475

Inorganic Motor Disturbances—Briand and Rouquier state that they have encountered recently a number of cases of

motor disturbances which would most certainly have been classed as hysteria if it were not for the prevailing epidemic encephalitis Evidently they belong in this latter group and they sustain the assumption of some infectious element as a factor in the so-called inorganic motor disturbances

Diabetes—Farges recalls that the sugar in the blood is derived from the glycogen in the liver and not directly from the food, and that levulose and lactose do not induce glycosuria or hyperglycemia in diabetics Even when glucose or saccharose is taken with the lactose no further reducing power is conferred on the diabetic urine His course of treatment is with restriction to 2 liters of milk to which he adds 200 mg, more or less, of lactose. In one of his twenty cases the man had 20 gm sugar per liter, with 2 100 c c of urine, when first examined His diet was not changed except that he took 20 gm of lactose daily for a week The glycosuria was then 7 85 per liter, then the diet was restricted to 2 liters of milk and 100 gm of lactose, and in four days the urine was free from sugar Then eggs, veal, chicken and green vegetables were allowed in addition and during the several months to date his health has been perfect, with no trace of glycosuria *One woman of 61 with 37 76 per sugar* per liter and 2,400 c.c urine was put on the milk and 125 gm of lactose and in three days the urine was free from sugar In another group of cases the glycosuria showed marked reduction under the lactose from 85 5 gm in the twenty-four hours, to 3 15 gm for example after a week of the milk and lactose but when this threshold of sugar excretion was reached it was impossible to drive it any lower down This individual threshold keeps invariable and it is exclusively for glucose The higher the threshold in the urine the higher the glucose content in the blood With a threshold of 50 gm the prognosis is favorable under diabetic restrictions but above 200 gm death is imminent within a few months The threshold seems to be determined by the liver he says, it produces more sugar, the graver the disease Diabetes, therefore is the result of a perversion of a physiologic function the sugar excretion of the liver Experimental research, he adds, has confirmed this

*Chemistry of Thyroid Secretion E Herzfeld and R Klinger—p 567
*Significance of Slight Rise of Temperature in the Tuberculous H J A van Voornveld—p 567 Begun in No 26 p 539

Intradermal Tuberculin Treatment.—Sahli inaugurated the multiple inoculation of tuberculin with his *Nadelschnepper,* and states that this is proving in many hands a convenient and effectual method for tuberculin treatment The large number of pricks multiplies the areas for absorption while patients do not shrink as much from it as from a subcutaneous injection But he now prefers intradermal injection of the tuberculin as an improvement over all other methods This allows greater precision in the dose and the local reaction to the tuberculin generates local production of antibodies, which aid in immunizing It has further the advantage that the local reaction is an index of the degree of immunization that has been realized and a guide to the dose of tuberculin to use to avoid injurious effects, as the skin seems to be far more sensitive to tuberculin than all other tissues He emphasizes that intradermal tuberculin treatment and prophylaxis belong to the general practitioner as he sees the cases in the earlier stages when tuberculin treatment offers the greatest chances for success

Chemistry of the Thyroid Secretion—Herzfeld and Klinger report the results of experiments on tadpoles which apparently demonstrated that thyroid extract from which all traces of iodin had been removed displayed the same biologic action as if the iodin had not been extracted They regard this as testifying that the iodin content of the thyroid secretion has nothing to do with its biologic action

Significance of Slight Fever in the Tuberculous—Voornveld warns that when the rectal temperature shows a rise to 37 7 or up to 38 C (100 4 F) after an hour's walk, this suggests suspicion that something is wrong but it by no means testifies to tuberculosis, not even when the temperature goes still higher than this Individual habits must also be considered a letter carrier would react differently from an office clerk Halt an hour of repose after the test exercise should bring the temperature down to within three tenths of a degree Centigrade of what it was before the walk [Three tenths of a degree Centigrade is nearly six tenths of a degree Fahrenheit.] If the temperature takes longer than this to decline it is strongly suspicious of serious pathologic conditions and tuberculosis is usually responsible On the other hand the lack of a temperature reaction is not an infallible sign that conditions are normal

When the thermal reaction to exercise is approximately normal in the tuberculous this testifies that the focus is more or less healed and isolated Abnormal fluctuations in the temperature during repose, even if the rise is very slight demand strict enforcement of repose This point is the one most often neglected either the rise is overlooked or is regarded as too slight to be heeded He says that he has seen hundreds of patients die from the progress of their disease because the slight rises in temperature during the early curable stage had not been heeded Physicians must realize that it is just as wrong to allow patients with even a slight rise in temperature to go for a walk or to work as for a surgeon or obstetrician to neglect asepsis He records the temperature every two hours at first to ascertain the individual type also the monthly type in women The temperature is taken several times a day in the febrile and from once to three times in the afebrile then gradually only once in two three or seven days interposing an occasional day in which the temperature is taken oftener These conclusions are drawn from Voornveld's own observation and experience, but are sustained by literature which he cites

*Inflammatory Endotheliomas A Gutierrez —p 353
*Spontaneous Abortion of Diseases C Citrino —p 357
*Functional Diagnosis of the Liver Tiburcio Padilla —p 363
History of Care of Insane at Buenos Aires J Ingenieros —p 376

Endotheliomas—In Gutierrez s case the previously healthy woman of 33 developed a progressive subacute subcutaneous dermatitis—inflammatory lymphangi-endotheliomas with neoplastic elements Some of the bunches were excised but more and more kept coming Treatment with radium caused the subsidence of some of the bunches but the region ulcerated Nine photomicrograms are given

Aborting of Diseases—Citrino recalls that any and every disease may get a foothold and then die out before it has had time to develop the characteristic clinical picture This is the explanation of many puzzling transient morbid conditions, and it also explains the development of disease in the apparently healthy when the vitality becomes depressed from any cause This was shown by the development of malaria in France in native troops from malarial zones who had not had malaria at home It was disconcerting to observe that malaria could be acquired in France, but it soon proved that the men had been healthy carriers The stress of army life had broken down their resistance

Tests of Liver Functioning—Tiburcio Padilla gives the technic for the various functional tests in vogue, but comments that none of them can be relied on implicitly as kidney functioning may modify the findings in blood and urine Bile itself has comparatively little importance as it is merely a residual product, like coke in a gas plant The conclusions as to liver functioning have to be based on the oversight of the whole, the persistency and the intensity of the responses to the tests The only liver test which throws light on the prognosis is the camphor test although even this is not infallible He has obtained negative results with this test in transient jaundice or other conditions in which there could be no question of an irreparable loss of the liver function

*Menacing False Croup F Cardey —p 389
Gonorrhea Diagnosis and Pathology E Castaño —p 392
Etiology of Measles J A López —p 396
*Pepsinogenesis and Lymphocytosis A J Pavlosky —p 398
Pathologic Suicide R Bosch Jr —p 405

False Croup—Cardey explains that grave false croup is an inflammation of the larynx and trachea in children with the exudative diathesis Intubation is of little use the excessive secretion blocking the lumen of the tube and preventing its getting a hold so that it is promptly expelled, and it is impossible to keep replacing it through the whole course of the tracheitis which may last three weeks or more In several of his cases, the difficulty in breathing was just as pronounced the twentieth day after tracheotomy as at first whenever he attempted to remove the tube Diphtheria antitoxin is absolutely useless and usually aggravates the condition He ascribes the croup in great part to the improper food the children are getting, which aggravates the tendency to the exudative diathesis The children were all between 1 and 4 years old the age at which improper diet causes the greatest disturbances The practical conclusion from his experience is that children with this diathesis should have their diet regulated with exceptional care to ward off this false croup If it develops and resists ordinary measures, tracheotomy should be done without delay The air should be kept moist with steam and moist heat should be applied to neck and chest, and the food be mainly cereal and vegetable gruels and soups, with fruit juices

Origin of Pepsin—Pavlovsky reports research which has apparently demonstrated the important share of the spleen in the formation of the gastric ferments and that injections of spleen extract increase the quantity and improve the quality of the secretion in the stomach Injections of fresh leukocytes and red corpuscles from the horse acted in the same way All confirm the role of the spleen in normal digestion as well as in blood production and sustain the principle that the secretion of an organ is perhaps the best stimulant to promote its secretory function He gives the details of series of tests on dogs with a Pawlow gastric pouch, given an intramuscular injection of 25 c c of a 25 per cent decoction of spleen tissue the blood count recorded over long periods, and the units of gastric digestion

Intravital Microscopy of Eye with Gullstrand Nernst Lamp Koeppe —p 630
Rhinolaryngologic Hints for General Practitioner Finder —p 633

Healing of Solitary Bone Cyst—Lotsch reiterates that the bone should never be resected for a single focus of fibrous osteitis and reports a case in a girl of 10 in which roentgenograms taken every ten days showed bone tissue gradually filling up the cavity of the solitary cyst after curetting By the eleventh month not a trace of the cavity could be detected

Support of Perineum in Labor—Pfleiderer discusses his method of supporting the perineum to prevent laceration He commonly avoids antepartum irrigation of the vagina He avoids also in most cases putting his hand or even a finger into the vagina In case external palpation does not inform as to the presenting part, he palpates through the rectum Through the rectal wall he can distinguish the outlines of the head rump foot hand or umbilical cord Only very rarely does it become necessary to enter the vagina When the head begins to distend the vulva markedly, he places the patient on the right side requesting her to draw up the legs as much as possible He takes a position in front of the patient and lays his right hand on the head of the child in such a manner that the tips of the fingers of the outspread hand rest on the perineal border Then as the head of the child advances, he pushes the perineal margin ahead of his finger tips and over the head of the child, so that the distance from the anal opening to the edge of the perineum is not much greater than it was before the head began to protrude through the vulva Especial caution is required when the edge of the perineum reaches the chin of the child Here he checks a too rapid advance of the head By this method the number of perineal tears has been much reduced Even primiparae of advanced age are frequently brought through childbirth without injury to the perineum

*Anaphylactoid Purpura E Glanzmann —p 391
*Calcium Content of Blood Ida Handovsky —p 432
*Vascular Thrombosis in Young Children R Hamburger —p 439

Anaphylactoid Purpura—Glanzmann explains that the etiology of a pathologic predisposition to bleed is extremely complex In the purpura hemorrhagica group the composition of the blood itself is the main factor, in the anaphylactoid group chemical (toxic) influences acting on the capillaries are responsible, inducing stasis orthostatic purpura, and angioneurotoxic bleeding In a third group mechanical-dynamic factors are mainly involved, this includes the hemorrhagic phenomena in whooping cough and with thrombosis, etc The anaphylactoid hemorrhages on the other hand, have no connection with high blood pressure or local inflammatory processes This classification points the way to treatment, arsenic and transfusion of blood in the hemorrhagic purpura type and serotherapy in the anaphylactoid type

Calcium Content of the Blood in Connection with the Face Phenomenon—Handovsky reports that in twelve adults exhibiting the Chvostek sign and in nine free from it the calcium content of the blood was within the same range in all This conflicts with Stheeman s statement that the calcium content is low when this sign is positive

Thrombosis in Children—Hamburger analyzes twenty-six cases in young children of sinus thrombosis and three of thrombosis elsewhere The youngest child was 11 days old, and none were older than 4 months The somnolency and cerebral vomiting were not characteristic, but in a few cases there was stasis in the peripheral veins, with edema in face and head Symptomatic convulsions encephalitis, etc, reveal the bacterial infection of the brain, the cerebral localization of a general infection in which the sinus thrombosis develops so insidiously as to be usually a necropsy surprise

April 1920 **51** No 4

*Signs of Abnormal Ovarian Functioning R Schröder—p 217
*Indications for Interrupting a Pregnancy R T von Jaschke—p 232
Status Hypoplasticus E Mathias—p 249
Carcinoma of Vagina with Genital Prolapse E Kleeman—p 252
Mental Condition of Parturients F Poensgen—p 256 Conc n

Clinical Signs of Abnormal Functioning of the Ovaries—Schroder says that constitutional factors may be responsible for excessive functioning of the ovaries, or the loss of inhibitory factors from other endocrine glands Chronic metroendometritis may develop as the consequence of long continued ovarian hyperfunc ioning but transient hyperfunction is usually a period of increased physical mental and sexual vigor Secondary insufficiency of the ovaries may be traced to pelvic disease, to excessive or deficient functioning of the thyroid suprarenals or pituitary, to cachexia of any kind, or acute and chronic intoxication of medicinal or parenteral nature from metabolic or nutritional disturbance, to anemias or chlorosis, to carbon dioxid intoxication from defective circulation, to nervous or mental derangement, possibly from abnormal distribution of the blood or to unknown causes, as from change of climate If all these can be excluded primary insufficiency of the ovaries may be assumed and proper treatment instituted Perverted ovarian functioning is manifested in irregular bleeding from the uterus from the persistence of ripe follicles without any corpus luteum stage With cystic degeneration of the ovaries the follicles do not ripen, but with this hemorrhagic metropathy the persistence of the follicles keeps the endometrium in a constant state of proliferation Another aromaly for which perverted ovarian secretion is known to be responsible is the persisting corpus luteum It may be so large as to simulate extrauterine pregnancy

Justified Indications for Interrupting a Pregnancy—Von Jaschke reviews the whole field of pathologic conditions in which the continuance of the pregnancy seems fraught with special dangers, his conclusion being that such conditions are few and infrequent In 385 cases in which others advised intervention he was able to escape it in 278 Only when cough, night sweats evening fever and progressive loss of weight continue in spite of sanatorium treatment does he regard abortion as indicated After the first three months he intervenes only if the lung process is mild or only recently flaring up, otherwise we cannot hope to influence the disease with any measures It the woman has several living children, or if there is laryngeal tuberculosis or this is the first pregnancy in far advanced tuberculosis he interrupts the pregnancy and sterilizes the woman With acute heart disease during a pregnancy he advises to empty the uterus by anterior colpohysterotomy under lumbar anesthesia after the acute manifestations have subsided With chronic heart or valvular disease, even symptoms of failing compensation do not justify it unless the heart was manifestly insufficient before the pregnancy In these cases and with albuminuric retinitis the woman should be under constant supervision in an institution while the question of intervention is being considered He has encountered only four cases in which uncontrollable vomiting compelled interruption of the pregnancy

Status Hypoplasticus—Mathias insists that this condition explains many otherwise mysterious instances of death from fright sports and under anesthetics One man of 20 died after three months of increasing weakness and subnormal temperature, blood pressure 60 or 70 mm Necropsy disclosed an extremely narrow aorta In a case reported in detail the woman of 23 died suddenly after spontaneous delivery, and necropsy showed marked hypoplasia of the blood vessels and suprarenals lymphatism and embryonal shape of the kidneys—thus a biologically substandard organism unable to stand the stress of childbirth plus a little chloroform

Urology for the General Practitioner Schlagintweit—p 186

Roentgen-Ray Treatment of Cancer—Lobenhoffer advocates postoperative irradiation of cancer but states that no detail of operative technic should be neglected with the idea that irradiation can be relied on to make up the deficiency, as such is not the case—it cannot always be relied on In inoperable carcinomas raying is a good adjuvant in the care of the patients as it may lessen their suffering and prolong their lives More than that we cannot expect at present Roentgen-ray treatment cannot as yet be considered specific for cancer and its application is neither so simple nor so harmless that it can be carried out without careful study of the indications and critical consideration of all the factors concerned He does not think that roentgenotherapy in cancer is sufficiently developed to be used by the general practitioner

Two Years' Experience with Silver Arsphenamin—Galewsky has used silver arsphenamin for more than two years and in that time he has given 2000 injections He considers silver arsphenamin sodium as the most efficacious of all arsphenamin remedies that have appeared so far With no other arsphenamin preparation has he had so few side reactions but the dosage must be carefully regulated, being gradually increased and also adapted to accord with idiosyncrasies He begins with a small dose 0 05 gm in the case of weakly women otherwise 0 1 gm and increases the dose every four or five days until he reaches the maximal dose 0 3 gm for men and 0.25 gm for women although ordinarily he does not give men more than 0 25 gm and women more than 0 2 gm as the maximal dose If these heavy doses are not well borne by the patients—if they are sensitive to arsphenamin—he gives smaller doses more frequently and increases the dosage very gradually He always waits for any untoward effects such as headache nausea dizziness vomiting, weakness etc, to subside before giving a new injection

Anaphylaxis in Lymphogranulomatosis.—Bierich discusses the pathogenesis and the differential diagnosis of lymphogranuloma The portal of entry has not as yet been demonstrated The essential biologic characteristics of the lymphogranuloma are that a granulation tissue presents at one and the same time different stages of specific inflammation while a tendency to retrogressive metamorphosis is noticeable Characteristic albumin decomposition products are present In uncomplicated cases (from 30 to 50 per cent) when this stage is reached local and general anaphylactic symptoms appear At a later stage either with or after development of the retrogressive phenomena connective tissue proliferation frequently with hyaline degeneration, takes place which leads finally to the induration of the granulation tissue The latter is not usually confined to the lymphadenoid tissue that was first attacked In the microscopic preparation it can be

seen breaking through the physiologic borders and sending its proliferative infiltrate into the neighboring regions In the manner of its local extension the lymphogranuloma closely resembles lymphosarcoma For the differential diagnosis the clinical symptoms must often be taken into account The proof has not yet been presented however of the hypothetic specific anaphylaxis-producing albumin catabolites in this disease

Subcutaneous Injections of Quinin M Klotz —p 141
*Neo Arsphenamin Taken Mistakenly Internally M Friedmann —p 142

Vaccine Therapy in Furunculosis of Infants —Langer recommends vaccine therapy in the treatment of furunculosis in infants The injections are given daily from 500 to 1 000 million bacteria being employed He finds that the danger from secondary infection is less with intramuscular than with subcutaneous injections Two or three injections will usually bring about remarkable results It has been shown that the new-born infant lacks the power of forming specific antibodies Langer therefore, does not explain the favorable effect of vaccine therapy in infants on the basis of the formation of specific antibodies but is rather inclined to bring it under the head of nonspecific protein therapy Older children, who have developed more or less fully the power of forming antibodies require for this reason different treatment He uses a commercial vaccine

Neo-Arsphenamin Taken Mistakenly Internally —Friedmann reports a case in which the patient through a misunderstanding took internally 1 8 gm of neo-arsphenamin She found the powder almost tasteless, but difficult to take on account of the extremely strong odor She had taken every evening for six consecutive days 0 3 gm of neo-arsphenamin in a glass of water For ten minutes after the ingestion of the powder she had suffered from slight abdominal pain Three days after taking the first internal dose, diarrhea set in but at the end of the six days the stools were again normal The patient showed no objective pathologic symptoms the urine was free from albumin and sugar, the Abelin and the Marsh tests were negative The Wassermann reaction was still positive three days after the last of the six internal doses One peculiar feature was that the patient through the internal doses of neo-arsphenamin got entirely rid of the oxyurids with which she had been troubled for some time

Infections Following Manicuring —Körbl reports thirty-two cases of infection of the fingers following manicuring In most of them the infection had led to severe inflammatory processes that required long treatment and caused more or less severe functional disturbances In several instances the infection even threatened the life of the patients The primary clinical picture was that of cutaneous panaritium In most of the cases the patients did not come for treatment until the primary stage had passed. Bacteriologic examination revealed in most cases mixed infection streptococci, however predominating Of the thirty-three patients only nine had manicured themselves In twenty-four cases the patients had secured the services of professional manicurists It seemed evident that the infection had been transmitted by instruments or ointments that had become infected In view of the foregoing facts, Korbl suggests that manicurists should be required by law to disinfect their instruments and by using an instrument, to avoid contamination of ointments, etc

Tracheo-Esophageal Fistula of Syphilitic Origin —Owing to its comparative rarity Krassnigg reports a fatal case of formation of a tracheo-esophageal fistula in a syphilitic He states that the vast majority of tracheo-esophageal fistulas are of carcinomatous origin, though a small portion are caused by ulceration from a foreign body in the esophagus A small number are tuberculous and congenital fistulas In Krassnigg's case the direct cause of death was bilateral inhalation pneumonia which had induced incipient gangrene of large portions of the right lung Artificial feeding through a stomach tube is strictly indicated in such cases, and the patient must be cautioned against laying aside the stomach tube even for once As for specific antisyphilitic treatment this may increase the size of the fistula instead of diminishing it Surgery does not promise much when the site of the fistula is so low down as was here the case The interposition of thyroid tissue has not gone beyond the stage of animal experimentation

Zentralblatt fur Gewerbehygiene, etc, Berlin

July 1920 **8**, No 7 Only medical articles listed

*Toxicity of Anilin Dyes Bachfeld —p 113 Cont d
*Toxic Action of Arseniuretted Hydrogen F Koelsch —p 121

Toxicity of the Anilin Dyes —Bachfeld's experience as physician to the large dye factory at Offenbach has not confirmed Weil's assertion in 1912 that 70 9 per cent of the 107 dyes he investigated are toxic to handle In six years, with an annual total of from 640 to 1,008 full time workers (300 days) only 32 developed skin disease, with a loss of 595 working days in all Of this group of 32 in only 7 was the skin disease traceable to handling the finished dye and in only 2 was this beyond question In these two instances the dye was black *schwefelfarbe* or *echtmarineblau* In handling the crude and the intermediate materials, 2 or 3 per cent of the full-time workers were affected, and of those engaged in direct production of the dyes, 3 or 4 per cent The article is to be continued

Industrial Poisoning with Arseniuretted Hydrogen —Koelsch adds eleven new cases to the 119 already on record in which AsH_3 generated in the course of the work caused severe destruction of the blood with a mortality of 27 7 per cent The cases occurred in chemical laboratories metal works balloons, and in making toy balloons, in Koelsch's cases during the manufacture of vanadium iron from ore containing vanadium (6 per cent) lead (30 per cent), copper (9 per cent), and arsenic (0 3 per cent), which was extracted with sulphuric acid This work had been going on for three years without mishap when, for some unexplained cause the dangerous gas was generated and all but two of the thirteen men were affected, and one died No special odor was noticed in the room

Of the five classes of hemolytic poisons, this is the only one likely to be encountered in the industries, and in the mild cases the symptoms suggest gastro-intestinal catarrh or catarrhal jaundice until the clear, dark red urine with quantities of albumin is noted The hematuria does not appear until after eight hours the jaundice not till the second day and the aspect may be more of a bronzing on account of the cyanosis There is no production of methemoglobin, in contrast to intoxication with the nitro bodies The blood shows destruction of from 75 to 80 per cent of the erythrocytes by the end of a week and the hemoglobin drops to 16 or 20 per cent Oxygen has to be supplied to tide the patient along and may have to be used for days and even weeks Given under pressure this saturates the remaining hemoglobin, and even the serum may absorb up to 2 per cent. To keep up the secretion of urine fluids should be supplied in abundance by the rectum with eventually venesection and infusion of Ringer's fluid or physiologic saline In prophylaxis ores as free from arsenic as possible should be used Some have sug-

gested keeping birds in the room, and a hydrarsenioscope has been devised which reveals the presence of the gas in the air by the yellow tint assumed by mercuric chlorid

Supravaginal Hysterectomy for Prolapse of Uterus.—Tittel's operation that he has used in seventeen cases has given entirely satisfactory results, namely the von Holst supravaginal amputation of the uterus suturing the stump to the abdominal wall He recommends this operation especially for total prolapse in elderly women

Spasm of the Nipple—Zimmermann describes a peculiar condition of the nipple in an otherwise healthy primipara When the child was 7 weeks old, he observed that a few minutes after it had nursed the nipple began to turn white At first a white spot the size of a pinhead could be seen in the center, it gradually spread over the whole nipple and resembled a Braun wheal induced on the skin The nipple felt hard At first the pain was confined to the nipple but later radiated to the whole mamma The phenomenon lasted from five to eight minutes and receded slowly A similar condition had been noted at times during pregnancy Therapeutic attempts proved unsuccessful

*The Sachs Georgi Reaction K. Dekenga and Plantenga—p 1631
Pathology of First Months of Life Cornelia de Lange—p 1633
Case of Hypernephroma of Kidney L J van der Mandele—p 1638

Deviation of Complement in Tuberculosis—Hekman found that all the human serums he examined laked sheep erythrocytes but that this laking property could be checked with tuberculous serum when an antigen, such as a 1 per cent solution of tuberculin was added to the serum He adds a little casein to absorb some of the hemolysins and reduce the tryptic power of the serum by diverting it away from the tuberculin It also serves to avert the nonspecific binding of the complement by the tuberculin The test gives a positive response in all cases of established tuberculosis, regardless of its location, the central nervous system excepted The prognosis depends on circumstances, an intense response showing large amounts of antibodies is a favorable sign but the extent of the lesions may be beyond recuperation From his observations in the course of this research and the experiences related by veterinarians and his theoretical reasoning he has become quite skeptical in regard to possible benefit from vaccine treatment of tuberculosis

The Sachs-Georgi Reaction in Syphilis—Dekenga and Plantenga report here the parallel findings with the Wassermann and Sachs Georgi tests as applied to their last 1 000 serums examined The last mentioned test becomes negative under treatment sooner than the former and the findings with the two tests were occasionally conflicting in different senses Hence the latter cannot be relied on alone but in combination with the Wassermann test it may prove instructive

Physical Standards of Children—Van der Loo measures the side-to-side diameter of the chest as the child stands with arms stretched horizontally at the sides and the diameter through sternum and spine as the arms are extended forward The average difference between these two diameters gives the most instructive chest measure compared with the circumference of the chest the vital capacity, the weight and the height. The records from 330 children are compared, confirming that by such measurements it is possible to sift out the children who are peculiarly predisposed to tuberculosis and start them on the right track in time

Epinephrin in Treatment of Abdominal Pain—Van Waveren describes as a typical instance of the benefit occasionally to be derived from epinephrin the case of a woman whose abdominal pains persisted unmodified after appendicectomy He ordered 50 mg of dry suprarenal substance daily but this dose had to be reduced to 25 mg Under this the abdominal pains subsided and the stools became regular Then the dose was continued for two weeks on alternate days and clinically normal conditions were restored for a time Then the complaints began anew and again the symptoms yielded to the epinephrin as also at a third recurrence Three months have elapsed since the last recurrence and the abdominal conditions have been apparently normal since The patient is undoubtedly neuropathic, and epinephrin probably stimulates the ganglion cells to better functioning

*Absorption of Visible and Ultra Red Rays by the Skin C. Sonne—p 321 Concld in No 23 p 353

June 2 1920 63 No 22

Papillomatous Tumors in the Thyroid Two Cases A Sennels—p 337

Absorption of Visible and Ultra-Red Rays by the Skin—This communication from the Finsen Light Institute seeks to explain the action of the general arc light baths by comparing effects of the light rays and of infra-red rays on the skin of the forearm Sonne announces as the result of his extensive research that the arm can bear without burning 3 11 calories per minute of the visible rays and only 1.79 per minute of the inner ultra-red rays and 1.33 per minute of the outer ultra-red rays None of the latter are reflected back from the surface while 35 per cent of the visible and of the inner ultra-red rays are turned back leaving only 2 02 calories to be absorbed Hence this figure represents the amount of the visible rays that can be absorbed without burning The temperature at the surface of the skin may therefore be 43 8 C under exposure to the visible rays but 45 5 C under the outer infra-red" rays With the latter the temperature decreases down to body temperature at a depth of 1 cm while with the visible rays the temperature increases with the depth to a certain point—about 0.5 cm—

where the temperature reaches 47.6 C. (117 F.). At this point, the temperature with the infra-red rays is only 41.7 C. In short, he declares in conclusion, with exposure of the skin to the light rays we are able to raise the temperature of the blood in and under the skin higher than can be realized with the strongest bearable dark heat rays. The difference may amount to as much as 5.8 degrees centigrade.

*Serum Sickness and Anaphylaxis. A. Ustvedt.—p. 625
*Is Tuberculous Meningitis Curable? F. Harbitz.—p. 644
*Treatment of Acute Empyema. E. Platou.—p. 666

Is Serum Sickness Anaphylaxis?—Ustvedt presents arguments to the effect that serum sickness and anaphylactic shock are two different reactions.

Is Tuberculous Meningitis Possibly Curable?—Harbitz cites evidence from the literature that tuberculous meningitis can pass into a phase of fibrous transformation which results in the complete cure of the active disease. Rossle has reported a case of chronic tuberculous meningitis in a woman of 37 with final fatal coma after seventeen months, and Harbitz here describes a similar chronic case with a five and possibly eight months course in a man of 38 with necropsy findings showing mild tuberculous meningitis just entering a phase of anatomic healing. Another feature of the case was the spreading of the infectious process along the blood vessels into the brain and spinal cord, thus presenting the picture of diffuse tuberculous encephalitis and myelitis. In 60 per cent. of cases of tuberculous meningitis, the patients are infants, and in them it is invariably fatal. The instances of a chronic course and recovery are nearly all in adults the resisting powers or increased immunity aiding in the struggle against the infection. Epidemic cerebrospinal meningitis often entails hydrocephalus and changes in the brain, with mental disturbance. But tuberculous meningitis seems to escape this tendency. If the patient recovers he is not left with defects. Lumbar puncture and tuberculin treatment may contribute to the favorable outcome. In conclusion Harbitz cites a case from Overland's practice in which a girl of about 7 had long presented symptoms of tuberculous meningitis, but finally recovered and in time married and has borne two children.

Treatment of Empyema.—Platou reports a death rate of 17.1 per cent. in his 105 cases of acute empyema after influenza. He operated in ninety-nine cases, three of his patients dying without an operation and three recovering without one. The best results were realized with resection of ribs and valve drainage. This technic is simple and easy and should be applied in all cases in which the acute empyema is not frankly fetid. After the pus has been aspirated out he explores with a finger to remove fibrin deposits, and then drains with a retention catheter and valve tube. The dressings do not have to be changed for eight or ten days.

*Serotherapy of Complications of Gonorrhea. J. Reenstierna.—p. 39

Serotherapy of Complications of Gonorrhea.—Reenstierna enhances the effect of the antigonococcus serum by adding some substance that will induce fever, hoping thus to render the gonococci more susceptible as they are unable to bear a high temperature. To induce this "antibody fever" he used killed cultures of bacteria, for example, those of typhoid. He has applied this combined serotherapy in 100 cases of different complications of gonorrhea, especially arthritis, epididymitis and prostatitis, and the outcome has been extremely satisfactory, he says, in the majority of cases. Some very grave cases of gonococcus arthritis subsided completely in a week or two after one or two injections. In a very few cases no benefit was apparent and he thinks that secondary infection was probably responsible for this. Prostatitis was generally cured in a week, and in one case a large gonorrheal abscess in the perineal region healed after a single injection. His antiserum is prepared by intravenous immunization of goats with cultures of living gonococci. Various reports on this polyvalent serum have been published in the last four years, his research at the state bacteriologic laboratory dating from 1914.

*Acute Digestive Disturbances in Infant. C. E. Bloch.—p. 745

Acute Digestive Disturbances in Young Infants.—Bloch lists four types: acute dyspepsia, the grave form, acute gastro enteritis, acute gastro-enteritis in the course of chronic dyspepsia, and the cases in which the diarrhea and vomiting are not due to any independent pathologic condition of the digestive tract but are merely a symptom of some pathologic condition in some other part of the body. The acute digestive disturbances represent merely the way in which the young infant reacts to any acute infection, regardless of its localization. Even overheating without infection or intoxication, may induce these symptoms in the digestive tract. Czerny calls this fourth group 'nutritional disturbances with parenteral infection' but Bloch thinks the term "symptomatic diarrhea" is more accurate as not only the cause and course are different but the treatment differs from that of actual nutritional disturbances. His mortality in the above four groups was zero in eighty-five cases of acute dyspepsia, 17 per cent. in the 310 cases of acute gastro-enteritis and 26 per cent. in the seventy-seven cases of acute gastro-enteritis in chronic dyspepsia. The mortality specified does not include the 4 and 7 per cent. that died within twenty-four hours of being admitted to the hospital. The grave form of acute gastro-enteritis is of infectious origin, mostly due to colon bacilli which are not pathogenic for older children, but in 10 per cent. of 217 cases paradysentery, typhoid or paratyphoid bacilli were isolated. The clinical picture was very much alike in all these. The main point in treatment is to supply water, especially by the mouth, but also saline subcutaneously. Weak tea instead of plain water may aid in stimulation. This restriction to water acts in acute gastro-enteritis regardless of its causal factors, but it should not be kept up for more than one, two or three days at most as inanition promotes acidosis. He warns that sugar and carbohydrates are liable to bring back the symptoms, and gruels are the worst food that can be given at these times. He feeds one part milk to two parts water boiled for two minutes in the Soxhlet apparatus. The effects have surpassed those of albumin milk, etc., in his experience. He continues this milk-water diet for not longer than a week at most, and emphasizes the importance of stimulants, stating that he makes extensive use of camphorated oil injections, digitalis preparations and caffein as indicated. Infants bear these stimulants well and they have often an unmistakably favorable action on the small pulse, subnormal temperature and other symptoms of impending collapse.

TOTAL HYSTERECTOMY IN FIBROID TUMORS OF THE UTERUS

A PLEA FOR THIS PROCEDURE IN PAROUS WOMEN WHEN OPERATION IS NECESSARY *

JOHN OSBORN POLAK, M Sc, M D

BROOKLYN

Is supracervical hysterectomy the operation of choice in treating those fibroid tumors of the uterus, in parous women, which require surgical intervention? This question is one which should be definitely settled in the interest of the patient for, owing to the ease with which the average supracervical hysterectomy can be done, the procedure has become routine with most surgeons and many gynecologists, who seldom consider the type of the operation to be selected by individual study of the character of the tumor, the condition of the cervix, and the age of the patient, and the subtotal procedure is therefore performed even in the presence of these cervical conditions which should demand total ablation of the uterus Hence the woman is frequently left with an infected, lacerated or hyperplastic cervix, which remains the seat of a focal infection Such a cervix, with its coexisting cervicitis and endocervicitis, tends to keep up from its infected glands a persistent and intractable leukorrheal discharge, and because of the extension of the infection through the lymphatic channels in the broad and uterosacral ligaments, the parametric tissues become thickened, sensitive and painful This explains the backache and pelvic pain so frequently complained of after the partial removal of the uterus

Furthermore, metrorrhagia is not an uncommon complaint when the retained cervix is lacerated, and the lips everted and eroded, from the overgrowth of the delicate intracervical lymphoid tissue This lymphoid tissue is easily irritated by vaginal contact, and bleeding results Hence in the subtotal extirpation, our follow-up work has shown that the lacerated or infected cervix remains as a constant menace to the woman's health, for not only does the retained infected cervix cause leukorrhea, metrorrhagia and backache, but this cervix with its lacerations, eversion and erosion paves the way for the occurrence of epithelial cancer in the retained stump

That this danger is real and not fanciful is proved by the fairly frequent occurrence of epithelioma in the conserved cervical stump

In reviewing the literature to establish the frequency of this occurrence, I have been struck by the relative infrequency of reported cases The paucity of these data is in direct contrast to the answers received from personal inquiry Altogether, in America, I have been able to collect 256 cases in which cancer has occurred in the cervical stump after subtotal hysterectomy for fibroid tumors This includes some of those cases already recorded by Leonard, but excludes all of those in which the cancer made its appearance within a year after the original operation, for it is fair to suppose that in these cases the disease was present at the time of the removal of the original tumor

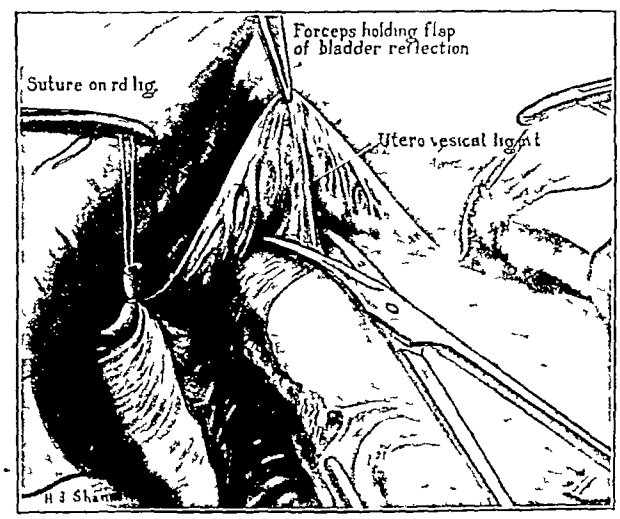

Fig 1 —Separation of bladder from cervix and upper vagina

Schottlaender, Spencer and Noble have shown by routine serial section of the uteri removed in more than 900 total hysterectomies that carcinoma of the cervix actually coexists in more than 2 per cent of all fibroid tumors of the uterus It is also significant to note that in these cases the malignant changes were undiagnosed at the time of the uterine extirpation, consequently, it is reasonable to suppose that there was nothing suspicious about the cervix except possibly lacerations at the time of operation And while it is admitted that a routine preliminary curettage and microscopic study of the scrapings might have shown cancer cells in all of these series, yet the fact remains that the occurrence of the new growth in the cervix in the reported cases, when a secondary operation has been done, as well as in those cases that were inoperable at the time the first saw the patients, has appeared at from five twenty-one years after

* Read before the Section on Obstetrics Gynecology and Abdominal Surgery at the Seventy First Annual Session of the American Medical Association New Orleans, April 1920

This fact must convince the thinking gynecologist that the parous cervix, with its traumatisms, eversions and erosions, is always problematic and has a potentiality which cannot be estimated by the absence

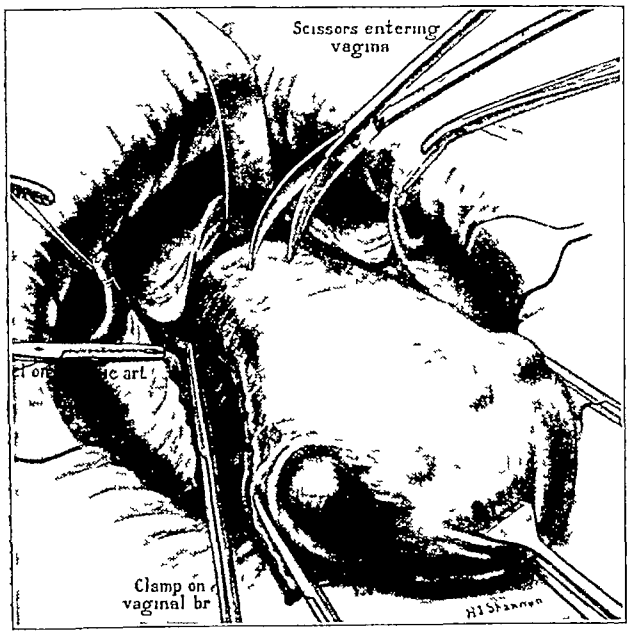

Fig 2—Bladder retracted incision being made into vagina with sharp pointed scissors

of cancer cells in the scrapings from an individual case at the time of the primary operation, and cannot be removed by cauterization or coning out of the cervical canal, for such treatment does not reach the most common point of origin in cervix cancer, i e, the vaginal portion

The advantages claimed for the subtotal operation are 1 The operation is more easily performed

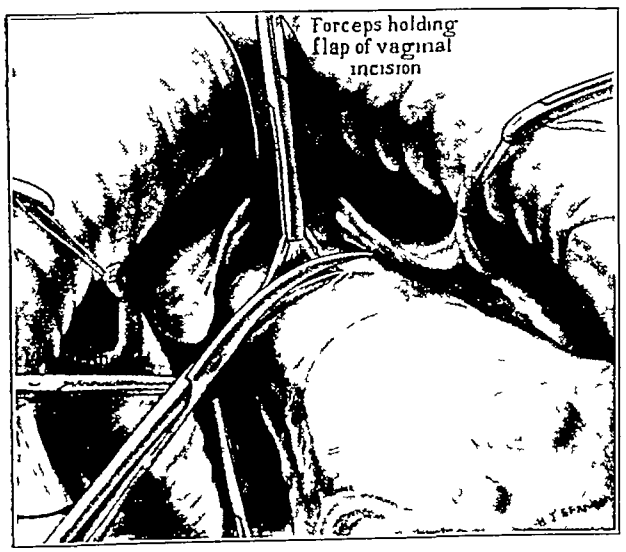

Fig 3—Separating cervix from vagina at cervicovaginal junction

2 It can be done more rapidly and with less loss of blood 3 It has a lower morbidity 4 It has a lower mortality 5 It does not shorten the vaginal walls 6 By retaining the cervical stump we leave the keystone of the arch, and thus maintain the conformity of the vaginal vault Therefore we are less likely to get prolapse of the vaginal walls

Are these contentions actually borne out by the experience of the trained gynecologic surgeon, and do they counterbalance the risks of leaving the cervix in the parous woman? To these questions we must answer in the negative, for only by following the end-results of these operations by a proper follow-up system as we have used for a number of years can we apply the acid test of the end-result to these contentions

Regarding the ease of performance and the time consumed in the operation, my personal experience is opposed to these claimed advantages, both of which are technical matters and depend largely on the training of the individual operator

My experience has been that the morbidity is lower in the total operation, while the mortality is 0 5 per cent higher in the complete extirpation (2 per cent) than in supracervical amputation (1 5 per cent)

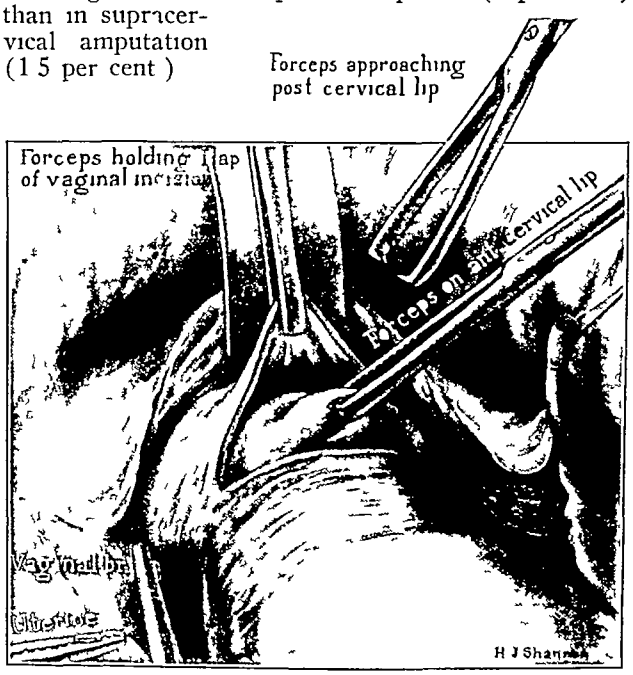

Fig 4—Cervix being everted through vaginal incision

Unless a wide cuff of vaginal wall is excised, the vagina is not materially shortened, and if the same care is taken to suture the round ligaments into the vaginal vault, and the cardinal ligaments are attached to the uterosacrals, as in the subtotal procedure, the vault of the vagina retains its high position

In observing the results from many clinics, we find that pelvic floor repair, even though it be necessary, is neglected by the average surgeon when he comes to take out the uterus, consequently, inversion of the vaginal walls is liable to happen in the subtotal, as well as in the total, unless due consideration is given to the matter of support from below and above For there is no reason to suppose that the cervical stump will remain high in the pelvis, unless it has its natural support from above and below, and this can be done just as well with the vaginal vault after the cervix has been removed, if the round, cardinal and uterosacral ligaments are attached in the vaginal stump, and the levators have been reunited, as when the cervix is left in place

It is incomplete gynecology that has brought about the criticism of the specialty by the general surgeon

Finished gynecology leaves a cured patient who does not seek the advice of other surgeons Again, in the parous woman I must repeat that it is always unsafe to leave the cervix, for cancer and the symptoms already referred to are actualities which any clinic with a follow-up system can demonstrate to the satisfaction of its clinical workers

The technic that we employ has been so planned as to obviate and overcome the criticisms of total removal and the claims for the incomplete operation, and the end-results have been so satisfactory that I have come to consider total hysterectomy as one of the curative measures that we can offer the woman with extensive fibroid disease

TECHNIC

The technic which we advocate is substantially as follows

After the patient has been catheterized and the vagina and cervix and cervical canal rendered sterile by thorough

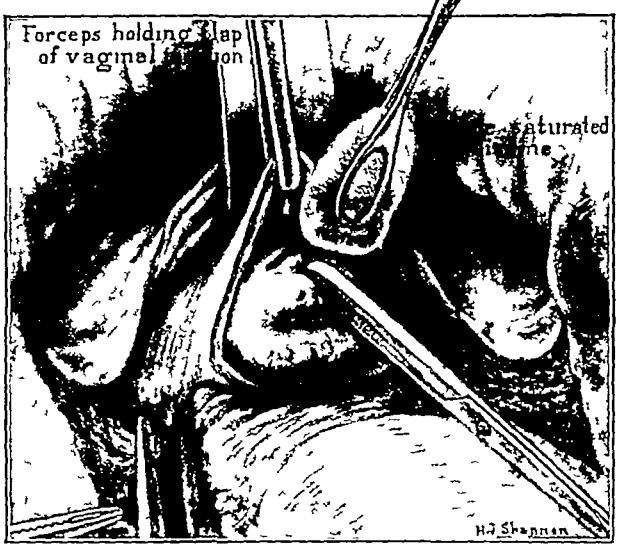

Fig 5—Iodizing cervix as it is dragged up with Jacobs forceps

iodization, the patient is anesthetized in the Trendelenburg posture, the Trendelenburg being gradually increased while the patient is going under the anesthetic This allows the intestinal coils to gravitate into the upper portion of the abdomen with each expiration The abdomen is then opened by a long abdominal incision to the right or to the left of the median line, extending from the pubis to the level of the umbilicus, or if the tumor is a large one, it may be carried to a considerable distance above this point The peritoneum is opened in the lower portion of the incision and two fingers are introduced into the lower angle of the wound and the edges of the abdominal incision are lifted up This as suggested by Guthrie, permits air to enter the peritoneal sac and further displaces the intestinal coils upward The wound edges are then protected by towels and the tumor exposed by proper retraction With a large pair of Jacobs forceps, the tumor is grasped and drawn out through the abdominal wound and eventrated as completely as possible This traction greatly facilitates the freeing of tubal, ovarian and intestinal adhesions, as it brings the field of operation directly into view After the tumor has been completely mobilized and it is drawn well over to one side to expose the infundibulopelvic and round ligaments, a clamp is placed close to the uterus including the tube utero ovarian ligament and the upper part of the uterine artery

The infundibulopelvic ligament is now tied distal to the ovary and cut free proximal to the ligature. The round ligament is now picked up and tied and cut on the uterine side of the ligature The tumor is then carried to the opposite side and the same procedure repeated Traction is now made on

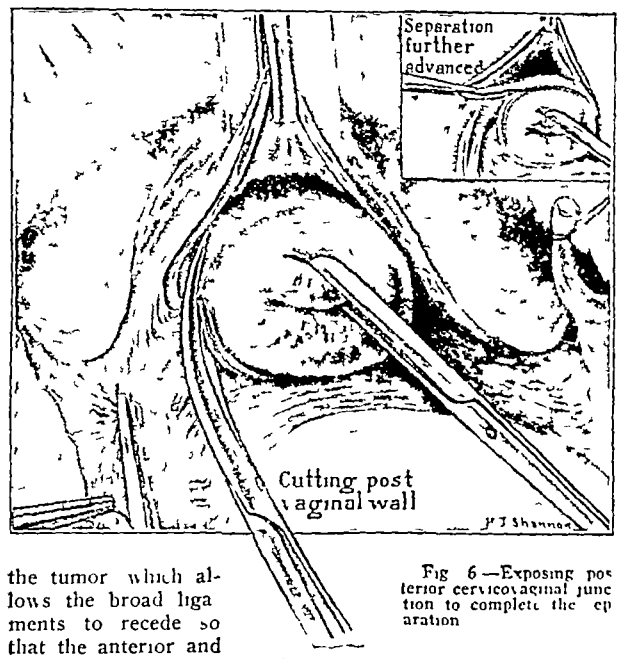

Fig 6—Exposing posterior cervicovaginal junction to complete the separation

the tumor which allows the broad ligaments to recede so that the anterior and posterior layers may be easily separated and the uterine artery exposed as it courses up the side of the uterus The anterior flap is now caught with a pair of mouse-trap forceps just anterior to the round ligament, and a pair of Mayo scissors passed beneath it across the front of the uterus As these are spread they separate the vesico-uterine fold from its uterine attachment and when it has been completely detached it is cut across from round ligament to round ligament

This permits us to separate completely the bladder from its uterine and vaginal attachments which naturally increases the mobilization of the uterus The tumor is now pulled forward over the pubis and the posterior fold of the peritoneum incised transversely just above the point of attachment of the

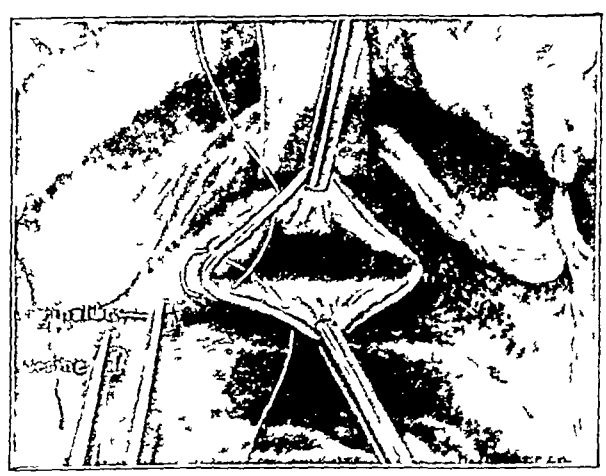

Fig 7—Closing vaginal tube with figure-of-eight suture

uterosacral ligaments and with a pair of Mayo scissors this flap of peritoneum is carefully separated from the posterior surface of the uterus This freely exposes the uterine arteries as they enter the uterus from the sides and by traction on the tumor the arteries are [illegible] the urete

naturally slip out of the way, thus the arteries can be grasped by a Kocher clamp with perfect safety and the uterus cut free proximal to the clamp

If the arteries have been properly isolated and the clamp has been applied at a point just distal to the origin of the vaginal branch, the remainder of the operation is practically bloodless

The bladder is then retracted with a Doederlein retractor and the vagina exposed just below the cervical junction With a long pair of sharp-pointed curved scissors the vagina is entered by a transverse incision just below its attachment to the cervix, and the anterior vaginal wall grasped in a pair of Jacob's forceps As the air enters the vagina it at once balloons it, and a pair of Jacob's forceps grasps the anterior lip of the cervix While upward traction is being made on the anterior lip of the cervix, the cervix and vaginal wall are again iodized and a strip of iodin-soaked gauze is passed from above downward through the wound We then continue the incision of the vaginal wall completely around the cervix at the cervicovaginal junction This is greatly facilitated by placing a Jacob's traction forceps on the posterior cervical lip and drawing it upward through the vaginal wound, as by this traction the cervicovaginal junction posteriorly is exposed

It may be necessary before cutting the uterus free to apply a Kocher clamp transversely so as to include the posterior vaginal wall and each uterosacral ligament This absolutely controls all of the hemorrhage from the cut edge of the vagina and allows us to free the uterus from its posterior attachments

The tumor and uterus having thus been removed, we next place a suture through the anterior and posterior vaginal walls, whipping these two surfaces together mucous surface to mucous surface This insures complete hemostasis of the vessels in the cut edges of the vaginal tube, and when tied gives a traction suture which is of considerable advantage in the subsequent steps of the operation

With the hemorrhage completely controlled, the tumor removed, and the vaginal vault closed, the round ligaments are now brought into and sutured into the vaginal vault While this is not considered by some surgeons as a necessary step, we find that when the ligaments are sewed into the vault relaxation of the vaginal walls is less likely to occur Furthermore, in this technic, we have taken care to preserve the uterosacral ligaments and they are also attached to and sutured into the vaginal vault, thus maintaining its high position in the pelvis

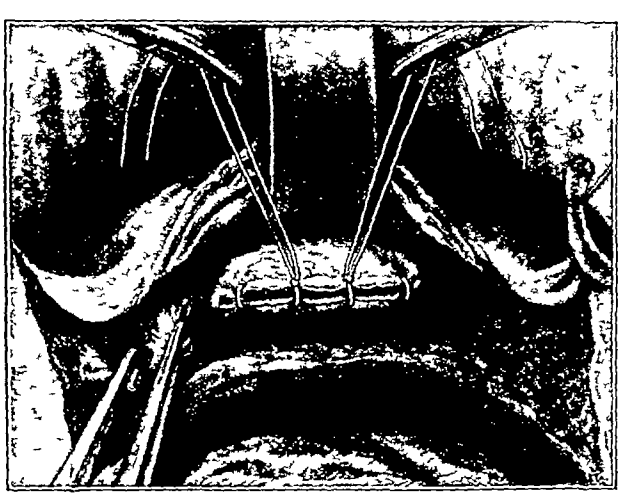

Fig 8.—Tied sutures acting as guys

The next and final step in the procedure is the peritonealization of all raw surfaces This is done by uniting the posterior fold of the broad ligament with the anterior, burying the stumps of the ovarian and uterine arteries and carrying the bladder reflexion of the peritoneum over the vaginal stump When the toilet is complete there should be no raw surfaces exposed, but a smooth peritoneal face extending from one pelvic wall to the other

CONCLUSION

When it is necessary to operate for fibroid tumor of the uterus in the parous woman or in those who have had trauma or infection of the cervix, total hysterectomy is the operation of choice

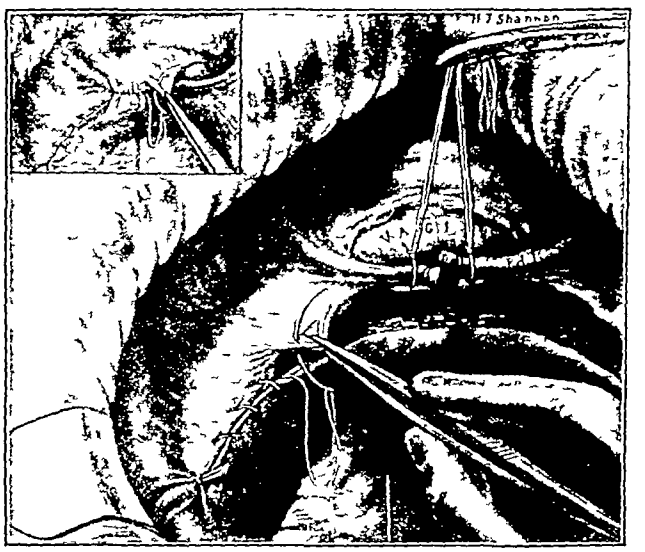

Fig 9.—Round ligaments sewed into stump completing the peritoneal toilet

287 Clinton Avenue

ABSTRACT OF DISCUSSION

DR EDWARD E MONTGOMERY, Philadelphia In the majority of cases of malignant disease the cervix is the seat of the disease because of its liability to injury during childbirth More or less disturbance from subsequent efforts at repair and its retention in hysterectomy renders this structure more prone to the development of malignant degeneration It is not always so easy to perform this operation as you may be led to believe from the diagrams the doctor has shown us The fibroid growths may be situated in the anterior, posterior or lateral wall, spreading out into the broad ligament, rendering it difficult to reach the cervix from any point Sometimes a preliminary reduction of the size of the mass by enucleation may be necessary In one case the growths were packed into the pelvis so that they had to be removed separately before complete extirpation of the uterus could be accomplished In many cases the approach to the cervix from in front will be the most expeditious procedure The ureters will be in less danger of injury When the tumor occupies the broad ligament of one side, it is better to enter the vagina opposite Traction on the cervix will permit the growth to be rolled out of the ligament without injury to a displaced ureter The plan presented for closing the vagina saves delay in healing The recommendation to remove the entire uterus should appeal to the careful operator

DR ALBERT GOLDSPOHN, Chicago I fully concur in Dr Polak's conclusions, but I am rather inclined to extend the indication beyond parous women It happens not infrequently that the retained cervical canal, even in the nullipara, remains the focus of considerable trouble I have observed endocervicitis in a number of such cases Some of these women had been treated rather unwisely by caustics which had caused stricture and sometimes occlusion of the cervical canal Such conditions then become very troublesome, and in the view of the profession nowadays as to focal infection, it seems to be dangerous even in that regard I myself have

seen two cases of cancer of the cervix that remained after some one else had removed the uterus The operation, as Dr Montgomery very prudently pointed out, is not quite as easy always as would be indicated by the operation designated by Dr Polak It is the procedure to which I have given preference, however, for about six years, and in view of the superior results, the difficulty in technic is not to be considered, except in cases where the added surgical risk should not be assumed

DR WILLIAM KOHLMANN, New Orleans I am glad that Dr Polak emphasized his preference for the total over the subtotal hysterectomy Many years ago I saw a case of carcinoma develop in the cervix after removal of the uterus It was difficult to remove the cervix There are two reasons, mainly, why I have always done a total hysterectomy First, if you leave a lacerated cervix it will cause disturbances, such as discharge and heaviness, symptoms which are observed in many cases, but not when both ovaries are removed This procedure is not however, advisable as a rule In case of removal of both ovaries, the cervix would shrink considerably in a short time The second cause is the danger of cancer of the cervix I have seen seven such cases in the last ten years I believe that radium, preferably would be indicated for primary treatment Regarding the operation, as Dr Polak suggests, I believe it can be followed more or less in every respect In my opinion, opening the vagina in front is the easier way to proceed He calls attention to the use of the round ligament, which I believe is very acceptable, although I do not make any special use of the ligament

DR. A C. SCOTT, Temple, Texas If I understand Dr Polak correctly, the primary reason for which he advocated total hysterectomy in preference to subtotal hysterectomy was that out of 900 fibroid cases investigated 2 per cent showed cancer Further, that 253 cancers have been found by others in the retained stump following subtotal operations It would be interesting to know how many thousand subtotal hysterectomies were performed in the series in which these 253 cancers of the cervix were observed A guess of 25,000 would not be unreasonable The occurrence of cervical stump cancer in 2 per cent of all fibroid uteri subjected to total hysterectomy in a series of 900 cases seems large, but I dare say that by reason of the higher mortality, more than 2 per cent could not have had the chance to develop cancer of the cervical stump had it remained On the other hand if all the cancers found in the series cited had occurred in the cervix after subtotal hysterectomy, which is not at all likely, most all the patients would have had still another chance for their lives Occasionally cancer of the cervix exists at the time that a subtotal hysterectomy is performed, but if the operator is careful in his examination, he is very apt to find definite evidence of a diseased cervix before operation I do not wish to be understood as advocating supravaginal hysterectomy in the presence of distinct disease of the cervix, but in the absence of apparent disease of the cervix, supravaginal hysterectomy should be given preference in all cases of fibroids of the uterus because the mortality is so low In my own series of more than 500 cases the mortality is a trifle over 1 per cent Operating with the patient in the combined position, the vaginal part of the cervix is so readily and satisfactorily examined while the pelvis is elevated and the abdomen open that [illegible] the cervix predisposing to cancer is not [illegible]

fibroid cases, we found that there was no difficulty in isolating them when it was necessary to do a Wertheim operation We practiced exposure of the ureter in every easy hysterectomy until we had perfected the technic. The report of twenty additional cases of cancer in the retained stump by those who discussed my paper, only goes to show that these cases are not so infrequent That makes 276 cases Dr Scott is right that there is a higher mortality in panhysterectomy, from 1.2 to 1.25 per cent, while the mortality in the subtotal operation is only 1 per cent In America it has not been the custom to have serial sections made of the entire uterus in these cases of fibroid tumor Hence, we have no positive way of knowing the incidence of cancer In the 900 cases I reported complete serial sections had been made. They showed an incidence of 2 per cent of undiagnosed cancer in the cervix In the 256 cases reported, the cancerous involvement of the retained cervix occurred in from five to twenty years after the original operation Consequently a preoperative curettage could not have saved these women If we are to save women from cervical cancer, we should repair or amputate the lacerated infected cervix

---

GENTIAN VIOLET IN THE TREATMENT OF PURULENT ARTHRITIS

WITH A DISCUSSION OF ALLIED PROBLEMS

JOHN W CHURCHMAN, M D
NEW YORK

In the treatment of purulent arthritis by lavage and staining interest first centered in the development of a satisfactory technic and the records of the early cases do little more than record improvement Three years ago the technical difficulties were overcome An apparatus was devised in every way satisfactory, and

Fig. 1 (Case 1) Purulent arthritis due to Staphylococcus aureus as result of treatment—normal flexion and extension

the cases treated since that time have been [illegible] that bacteriologic and other evidence [illegible] which to base an opinion [illegible] the merits [illegible] With the present report of these cases [illegible] discussion of some of the questions [illegible] laboratory studies Nothing new [illegible]

Staphylococcus aureus There were fever and tenderness, with marked limitation of motion

Treatment and Result—One lavage and staining resulted in prompt cure, there was limpid synovial fluid at second

Fig 2 (Case 2)—Purulent arthritis (Staphylococcus aureus) associated with compound comminuted fracture of patella final result

aspiration, which was sterile Knee motions were normal (Fig 1)

(*b*) CASE 2—*Purulent arthritis of the left knee, accompanying compound comminuted fracture of patella*—Thick bloody pus was withdrawn, which contained gram-positive cocci A pure culture of *Staphylococcus aureus* was obtained

Fig 3 (Case 3)—Pneumococcus purulent arthritis result of treatment—normal flexion and extension

There was the usual disability accompanying fractured patella, and the usual signs of purulent arthritis A large granulating incised wound of the soft parts just below the patella was present

Treatment and Result—After one lavage and staining the arthritis subsided and the fluid aspirated from the knee

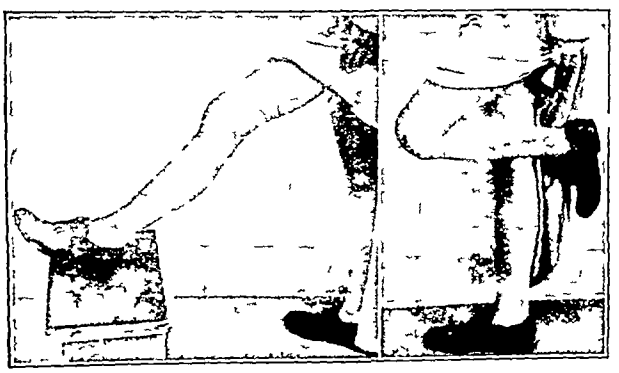

Fig 4 (Case 4)—Gonorrheal arthritis result of treatment—normal flexion and extension

became normal in character and sterile bacteriologically The granulating skin wound below the patella was allowed to heal, and the joint was opened It was normal in appearance and sterile bacteriologically The patellar fragments were approximated by suturing the prepatellar fascia

The result was cure of the arthritis, healing by first intention, and restoration of an absolutely normal knee (Fig 2)

2 PNEUMOCOCCUS ARTHRITIS

CASE 3—*Gonorrheal arthritis, with marked limitation of motion* (this was the picture and also the clinical diagnosis)—A Canadian soldier had received a penetrating pulmonary bullet wound some months previously, and the projectile was still in the lung, though causing no symptoms The golden serum aspirated contained diplococci, which, by mouse injections, were proved to be pneumococci The type was not determined

Treatment and Result—After one lavage and staining, the knee promptly returned to normal (Fig 3)

3 GONORRHEAL ARTHRITIS

Three of my early cases, not included in this report, were gonorrheal, and the results of treatment were

Fig 5 (Case 5)—Gonorrheal arthritis *a* condition on admission *b* and *c* condition on discharge

good but no more striking than in three of the four cases here reported Complete bacteriologic evidence in this type of arthritis is not always possible to obtain, owing to the difficulties of obtaining the organism In these cases the evidence obtained by examination of smears corroborated, so far as it went, the clinical proof that the arthritis had been cured Our inability to grow the gonococcus in a single case accounts for a regrettable, though unavoidable, gap in the evidence

It is true that the gonococcus is gram-negative and might be expected to be unaffected by gentian violet All my attempts to determine experimentally the effect of the dye on this organism have been defeated by its failure to grow at all, even on the most favorable medium, with any constancy[3] Whether the gonococ-

3 In a personal communication from a former pupil Dr C L Deming who at my suggestion has been working on this problem I am informed that he has succeeded in developing a technic by which constant growth of the gonococcus may be readily obtained

cus is gentian violet positive or gentian violet negative is therefore not at present known [4]

CASE 4—*Gonorrheal arthritis of the left knee*—The usual picture was presented, not particularly severe in type Golden yellow fluid with fibrin clots was obtained on aspiration There was marked limitation of motion The aspirated fluid contained gram-negative diplococci but the cultures were sterile

Treatment and Result—One lavage and staining were given, following which there was a prompt return of the knee to normal (Fig 4)

CASE 5—*Purulent arthritis of the left knee*—The clinical picture of a moderately severe gonorrheal synovitis was presented, though the attack was ushered in with a sore throat There was a golden yellow fluid containing fibrin clots at aspiration Intracellular gram-negative diplococci were found in the pus cells The cultures were sterile

Treatment and Result—After one lavage and staining, all clinical symptoms disappeared and the knee motions became normal A small amount of fluid, however, reaccumulated, this was aspirated, it contained no pus cells or organisms A second lavage and staining was done and on the reaccumulation of fluid, a third The patient was discharged well (Fig 5) I have recently seen her (about one year after treatment) and the knee is practically normal, there is slight tenderness at the lower border of the patella Motions are normal and there is no swelling She complains of pain in wet weather

Fig 6 (Case 6)—Gonorrheal arthritis final result

An arthritis, similar to that present in the left knee one year ago is now developing in the right knee, and she complains slightly of her left wrist and ankle

CASE 6—In this patient no bacteriologic evidence whatever could be obtained, but the clinical picture and the character of the fluid (golden yellow with fibrin clots) were those associated with gonorrheal arthritis The effusion was a large one but limitation in motion was only moderate

Treatment and Result—One lavage and staining were given Normal motions were restored and all clinical symptoms disappeared (Fig 6)

CONCLUSIONS AS TO THE EFFECT OF LAVAGE AND STAINING

The conclusion that pyogenic arthritis, due to *Staphylococcus aureus* or to pneumococcus, may be cured by this method is warranted by the facts It is also clear that normal mobility may thus be retained Whether the joint in this type of infection should ever be opened, unless the infection has become largely extra-articular, seems more than doubtful The evidence for these statements, while slender in quantity, is of such quality as to justify them Case 2 may be regarded as a crucial experiment in a human being Every control that could be desired was here present There was a granulating wound and a comminuted fracture of the patella The joint fluid on the admission of the patient was positive bacterio-

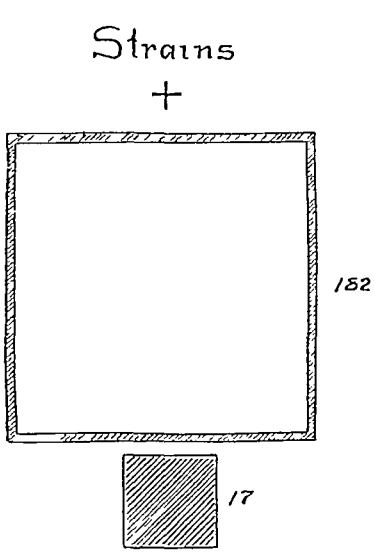

Fig 7—Schematic representation of effect of gentian violet on gram positive organisms study of 182 strains The central white square represents the number killed by the dye (165) the shaded border the number unaffected (17) The area of the shaded border is shown in the shaded square

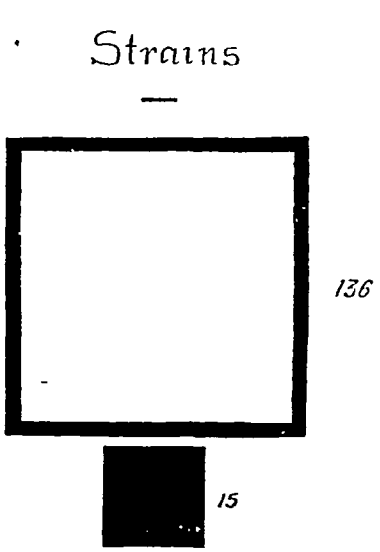

Fig 8—Schematic representation of the effect of gentian violet on gram negative organisms study of 136 strains The central white square represents the number unaffected by the dye (121) the black rim the number killed (15) It will be noted that the facts are just the reverse of those for the gram positive organisms The area of the black border is shown in the black square

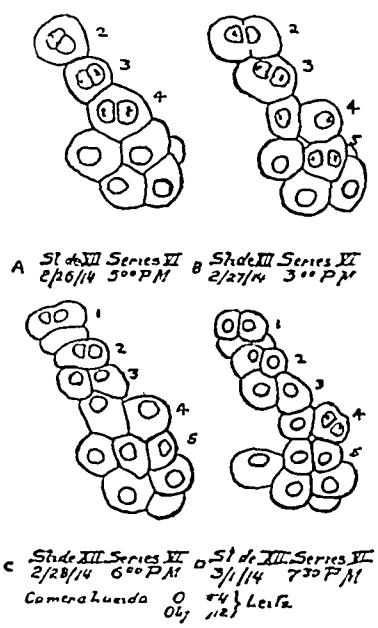

Fig 9—Diagrams made on four successive days of endothelial cells from the pericardium of an adult frog grown in plasma containing gentian violet 1 20 000 Cells and nuclei are stained and it will be seen that division of the stained cells and nuclei is observed from beginning to completion Figures 1 2 3 4 and 5 have been placed so that it is possible to follow the individual cells in the four diagrams

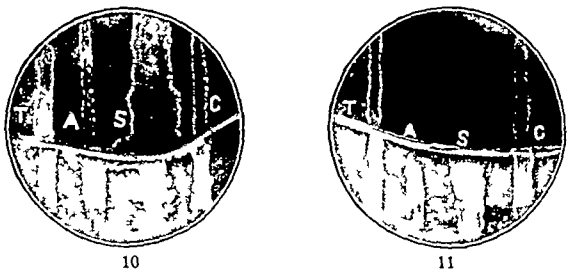
4 Simon's objection to the terms violet positive and violet negative is well founded as the selective property of the dye is in no way dependent on its color The terms were used in early publications purely for brevity's sake but it was there suggested that gentian positive and gentian negative are more accurate.

logically After lavage and staining, the joint fluid ceased to be purulent and became sterile, and clinical symptoms subsided Inspection of the joint surface at operation demonstrated a normal synovial membrane, and cultures from the joint were negative Healing of

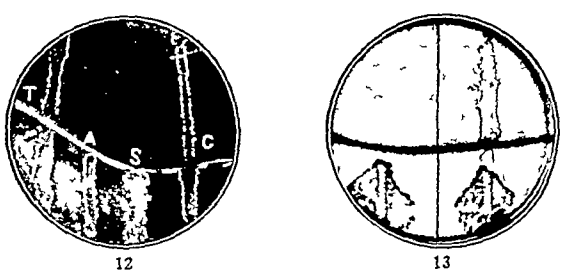


10 11

Fig 10—Gentian violet was injected into a rabbit's ear vein An hour and a quarter later blood was withdrawn from it and was used in making the upper half of this divided plate The selective power of the dye has disappeared (*T* B typhosus *S* B subtilis *A* M aureus *C* B coli the same lettering is used in Figures 11 12 14 and 15)

Fig 11—Upper half of the divided plate contains gentian violet and oxalated blood which have been allowed to stand mixed for one week Contact with the blood has not robbed the dye of its selective power

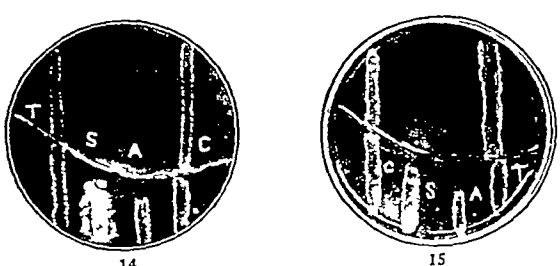
the sutured patella and of the skin occurred just as if bacteria had never been present, and normal knee motions were retained



12 13

Fig 12—Upper half of divided plate contains gentian violet and blood which has been oxidized by the addition of sodium phosphate and hydrogen peroxid Oxidation of the blood does not rob the gentian violet of its selective power

Fig 13—An illustration of the selective action of gentian violet on a mixture of gram positive and gram negative organisms A divided plate the upper half containing gentian violet agar and the lower half plain agar The left half of the plate has been stroked with a mixture of B subtilis and M aureus both gram positive The luxuriant growth in the plain agar ceases at a distance from the dividing line and there is no growth whatever in the gentian violet agar The right half of the plate has been stroked with the same mixture plus B typhosus (gram negative) At the point where the growth of B subtilis and M aureus ceases a pure culture of B typhosus is seen crossing the line and growing well in the gentian violet agar



14 15

Fig 14—The selective action of other triaminotriphenylmethane dyes is identical with that of gentian violet An experiment with ethyl violet is here illustrated

Fig 15—Experiment with rosolic acid the upper half of the plate contains rosolic acid agar the result is the same as with gentian violet

Concerning the gonorrheal cases, somewhat more cautious statements must be made And yet, making due allowance for the mild character of the cases treated (they were, of course, not selected cases), and for the fact that complete bacteriologic proof of cure could not always be obtained, the satisfactory clinical course warrants the belief that lavage and staining offer a method of controlling this disease Such bacteriologic evidence as it has been possible to obtain strengthens this conviction

STAINING OF ORGANISMS IN THE TISSUES

The clinical and bacteriologic studies make it seem likely that dye injected into a joint stains bacteria which lie in the depths of the synovial membrane Proof that this occurs is not at hand, though it has been sought experimentally A technic was recently described[5] by which it has been possible to demonstrate microscopically that the stain does reach the deep cells of the mucosa, and clinical evidence has been presented,[6] from a study of the effect of the dye on amputation stumps, to show that the bacteriostatic property of the dye, which persists in and about the cells, is of importance

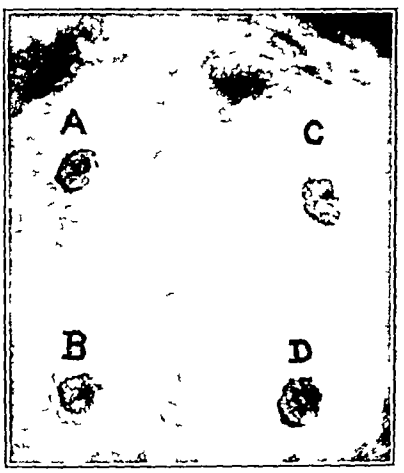


Fig 16—*A* and *B* are the controls *C* and *D* the vaccinations with stained virus the takes have been equally good

THE GRAM STAIN

The facts as to the parallelism between the Gram stain and the gentian violet reaction, revealed by a study of 318 bacterial strains, are represented in Figures 7 and 8.[6] Whether this parallelism is accidental or depends on some fundamental structural or chemical difference between the gram-negative and the gram-positive organisms is a problem susceptible of experimental solution, and the solution is now being sought[7]

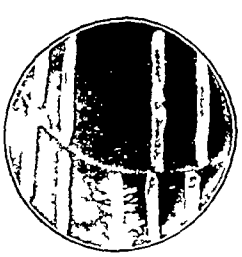

Fig 17—The selective action of gentian violet within a bacterial species the upper half of the plate contains agar to which the dye has been added the lower half plain agar The plate has been stroked with five strains of the gram negative B enteritidis four of these have followed the rule the fifth (at center) refuses to grow in the presence of the dye

THE EFFECT OF GENTIAN VIOLET ON TISSUE CELLS

It is possible to stain with gentian violet the living epithelium of the mucous membrane of the bladder, in experimental animals without doing any appreciable damage

5 Churchman J W Selective Bacteriostasis in the Treatment of Infections with Gentian Violet J A M A 74 145 (Jan 17) 1920

6 The original observations as to this parallelism have been amply confirmed by the work of others Crossley, in a paper read before the Dye Section of the American Chemical Society, found the parallelism complete not only for gentian violet but also in confirmation of my findings for other members of the triphenylmethane group (J Am Chem Soc 41 2083 [Dec] 1919) The technic he used was that described in 1912

7 Crossley in the article mentioned in Footnote 6 also calls attention to the fact that the effectiveness of the dye is governed by two factors the composition of the dye and the nature of the organism It is caused by the presence of reactive groups in the structure of the bacteria which are capable of readily combining with the dyes through certain reactive groups in their structure Crossley agrees with my statement that this variation in the susceptibility of bacteria to destructive chemical agents is of the greatest practical therapeutic importance.

to the tissue cells The absence of signs or symptoms of irritation in the human beings whose knee joints have been injected justifies the assumption that the process is equally harmless for synovial epithelium This assumption has received experimental confirmation from a study of the effect of the dye on protozoa (oxytricha and paramecia), and on living tissue growing in vitro The view is commonly held that the living nucleus cannot be stained My experiments justify the conclusion that gentian violet does actually penetrate the living cell and its living nucleus The division of stained cell and stained nucleus (Fig 9) cannot be interpreted as a survival phenomenon It proves that life proceeds uninterrupted in the stained cell [8]

FATE OF THE DYE IN THE ANIMAL BODY

Gentian violet injected into the circulation soon disappears from the blood stream (Fig 10) This change is not due to mere contact with blood, as can be demonstrated by repeating the experiment with oxalated blood which is kept in contact with the dye in vitro (Fig 11) Nor does the disappearance of the dye depend on blood oxidation, for if oxidation be produced by the addition of sodium phosphate and hydrogen peroxid, selective bacteriostasis is as sharply marked as when venous blood is used for the plates (Fig 12)

No such rapid transformation of the dye occurs when it has lodged in epithelial cells Yet even here it is not permanent, it is slowly changed and ultimately disappears A chemical substance which kills many bacteria of clinical importance, which does not injure tissue cells,[9] which persists for some time, but is finally disposed of, and which penetrates tissue, apparently possesses certain valuable properties not found in other bacteriostatic agents

APPLICATIONS OF SELECTIVE BACTERIOSTATIC PROPERTY OF GENTIAN VIOLET IN PRACTICAL BACTERIOLOGY

The possible application of the selective bacteriostatic property of gentian violet to the elimination of

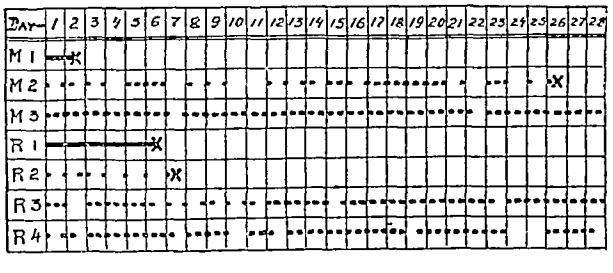

Fig 18 —The results of animal inoculation with stained B anthracis *M* mouse *R* rabbit The course of control animals is represented by a solid line the course of experimental animals by a dotted line X indicates that cultures at death from heart s blood and spleen were positive for B anthracis The survival of M3 and of R3 and R4 is important but the most interesting feature of the experiment is the death of M2 from anthrax twenty six days after the injection was made

gram-positive organisms in cultural work was suggested in early publications The original experiment indicated the kind of thing that might be done (Fig 13) The following applications of these observations have been made by others

(*a*) Petroff's method for cultivation of tubercle bacilli directly from sputum and feces [10]

(*b*) Elimination of spurious presumptive tests for *B coli* in water, by the use of gentian violet [11]

(*c*) Elimination of spurious presumptive tests in the examination of milk [12]

(*d*) Selective elimination of the hay bacillus from cultures of obligative anaerobes by the use of gentian violet [13]

(*e*) Experiments done during the epidemic of influenza to determine whether the dye might be of use in the isolation of *B influenzae* (not yet complete)

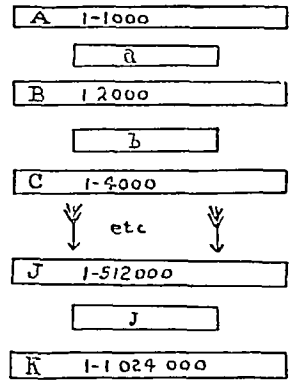

Fig 19 —Schematic representation of what probably occurs when stained organisms are injected into animals *A* first generation *a* first daughter cell *B* second generation at adult size *b* second daughter cell Generations intervening between *C* and *K* are omitted for brevity *K* eleventh generation By fission and growth the stain is reduced from 1 1 000 in *A* to 1 1 024 000 in *K*

SELECTIVE BACTERIOSTASIS AND CHEMICAL STRUCTURE OF THE DYE

It was early recognized that the selective property of gentian violet was also possessed by other dyes having a similar chemical structure (members, that is, of the triphenylmethane series) [14] Figure 14, for example illustrates a divided plate experiment with ethyl violet The result is the same as if gentian violet had been used A large number of experiments have also been made with substances that possess a simpler molecular formula than does gentian violet In Figure 15, for example, an experiment with rosolic acid is represented [15] The purpose of these experiments, and others of a chemical nature now under way, is to determine the portion of the triphenylmethane molecule responsible for the selective property [16]

EFFECT OF GENTIAN VIOLET ON TOXINS, ENZYMES AND ULTRAMICROSCOPIC INFECTIONS

The interest in the effect of a bacteriostatic agent, though centered in its action on bacteria, should not be confined to this field The effect of the dye on four

8 There is some evidence for thinking that anilin dyes may exert a selective influence on tissue growth (possibly stimulating epithelium and retarding connective tissue) similar to their selective influence on bacteria

9 This statement is not absolutely true There is probably no substance which is entirely without injurious effect if applied to cells in sufficient strength or repeatedly gentian violet is certainly irritating and probably destructive when used in great strength or continuously The statement is accurate for the dilutions of dye which have been used

10 Petroff S A J Exper M **21** 38 (Jan) 1915

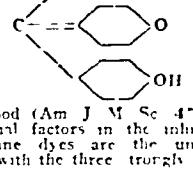
12 Hall and Elepson J Bacteriol **3** 355 (July) 1918

13 Hall I C Selective Elimination of Hay Bacillus from Cultures of Obligative Anaerobes J A M A **72** 274 (Jan 25) 1919

14 Churchman J W J Exper Med **17** 373 (April) 1913 Dahlia parafuchsin magenta pararosanilin rosanilin crystal violet and methyl violet were the substances studied all possessed the selective power The assumption was made that the power was inherent in all the triphenylmethanes Crossley inclines to the same belief and thinks that the selective action is related to the basic nitrogen He finds that an increase of the ethyl groups and a substitution of methyl radicals for aminohydrogen intensifies the bacterial action Gentian violet is a mixture of dextrin hexamethyl pararosanilin hydrochlorid penta methyl pararosanilin hydrochlorid and certain lower homologues particularly the tetramethyl compound It is not synonymous (as sometimes thought) with benzyl violet or with pyoktanin (methyl violet)

15 Rosolic acid is an oxyderivative of triphenylmethane and has the formula



16 Simon and Wood (Am J M Sc **[illegible]** and 544 1914) conclude that the essential factors in the inhibitory power of triaminotriphenylmethane dyes are the undetermined group in combination with the three strongly auxochromic amino groups

other groups of active agents has been studied (*a*) The unorganized ferments (ptyalin, pepsin, trypsin, rennin and thrombin) are unaffected by staining (*b*) The organized ferment (yeast cells) is killed by staining (*c*) The toxins of tetanus and diphtheria are unaffected, beyond a possible slight impairment of toxicity in the case of tetanus [17] (*d*) Of the ultramicroscopic infections, rabies and vaccinia [18] (Fig 16) are unaffected by the dye Experiments with the virus of poliomyelitis yielded conflicting results

SELECTIVE ACTION ON CLOSELY RELATED BACTERIAL STRAINS

The phenomenon of fastness, which accounts for the failure of certain bacterial and protozoan strains to yield to chemical agents capable of killing other strains of the same species, is well known Spirochetes occasionally occur, for example, which are fast to arsphenamin, and malarial parasites are encountered on which quinin has no effect [19] In a study of the action of gentian violet on the *B enteritidis* group, a unique instance of what might perhaps be termed reversed fastness was encountered The members of the *B enteritidis* group are gram-negative bacilli, closely allied to *B coli,* and would be expected to grow on the gentian violet half of divided plates and to survive staining with the dye In a study of five stains of this organism, one was encountered that acted toward gentian violet exactly as the gram-positive organisms do (Fig 17) This strain, first studied in Baltimore and later encountered in the collection of the Museum of Natural History in New York, constantly exhibited this reversal of fastness, which in both the Baltimore and New York samples had been retained through hundreds of transplantations, both being descendants of a strain originally isolated in 1900 by Dunham of Cambridge Throughout their careers, subsequent to the original transplantation, they had maintained this astonishing characteristic, though indistinguishable from the other four strains by every other known test, including reaction to the higher sugars

ANIMAL INOCULATIONS WITH STAINED ORGANISMS

In order to determine whether organisms stained with gentian violet were really killed or only injured so that they would not grow on ordinary mediums, the stained organisms were injected into animals A strain of blastomyces pathogenic for guinea-pigs, and a virulent *Staphylococcus aureus,* were used for this purpose In both instances the results were positive The control animals died, and the organism was readily isolated from them The animals receiving stained organisms survived When *B anthracis* was used different results were obtained Huge doses of bacteria were injected into mice The control animals all died within forty-eight hours In the animals receiving stained organisms life was prolonged, and occasionally the animal survived In the animals that did eventually die, death was brought about by anthrax For instance, Mouse 2 (Fig 18) was perfectly well for twenty-five days, on the twenty-sixth day it died, and the heart's blood and spleen swarmed with organisms The animal behaved as though it had received the injection more than three weeks after the injection had actually been made When the experiments were repeated in the less susceptible rabbit, survival of the animals was more frequent That the organisms were not really killed by staining is shown by the death of some of the experimental animals That they were so injured as to be nearly harmless is shown by the occasional survival of the susceptible mouse and the frequent survival of the less susceptible rabbit

What happened to the organisms in an animal like Mouse 2? They were not killed, for the animal eventually died of the disease, yet they remained impotent for a long period, finally flooding the capillaries in the normal manner of this organism Of the several explanations suggested for this phenomenon, the one that has been adopted as a working hypothesis is shown in Figure 19 It is assumed that by slow fission and growth the intensity of stain in the bacteria is gradually reduced, so that if we start with a dilution of 1 1,000 (Fig 19 *A*) by the time the eleventh generation is reached (Fig 19 *K*) the dilution has been reduced to 1 1,024,000 Here the stain loses its effect and development proceeds normally Is any machinery of protection developed during this period? Did Mouse 2 acquire a partial, Mouse 3 and Rabbits 3 and 4 a complete, immunity? These questions are now being investigated

Meanwhile it is important to recognize the fact that survival of animals that have received organisms subjected to the action of a "bactericidal" agent is no proof that the organisms have really been killed, and, on the other hand, to appreciate that a substance that does not actually kill organisms may still be an important antiseptic by reason of its bacteriostatic properties

15 East Tenth Street

17 Hall and Taber (J Infect Dis 15 566 1914) have followed this lead in an interesting attempt to devitalize toxic cultures of B tetani intended for immunization of horses

18 Vaccinia is placed in the group of ultramicroscopic infections purely for convenience

19 Examples of fastness among bacteria have been less frequently observed than among protozoa Morgenthal's production of drug fast pneumococci is one of the well known instances in the bacterial field

EXPERIENCES WITH LUMINAL IN EPILEPSY *

JULIUS GRINKER, M D

Associate Professor of Nervous and Mental Diseases Northwestern University Medical School Professor of Nervous and Mental Diseases Chicago Postgraduate Medical School Attending Neurologist Wesley Postgraduate and Mercy Hospitals

CHICAGO

Luminal is comparatively unknown in the treatment of epilepsy Introduced in this country shortly before the war its importation was stopped before the medical profession became thoroughly acquainted with its properties Thus it happened that the claims made for it by German writers in the medical journals of 1912 and 1913 have not been verified until quite recently

My attention was directed to the value of luminal in epilepsy by the casual reading of an article by A Hauptmann, published in 1912 in the *Munchener medizinische Wochenschrift,* and confirmed by others

Hauptmann selected for his tests cases of epilepsy which had been previously under supervision for several years, or in which an exact history was obtainable Most of these had received large doses of bro-

* Because of lack of space this article is abbreviated in THE JOURNAL The complete article appears in the Transactions of the Section and in the author's reprints

mids for long periods In reviewing his experience he says

Luminal tends to exert a favorable influence on epilepsy by reducing the number and severity of the attacks Its field of applicability will be chiefly in those very severe cases of epilepsy which can no longer be controlled by the largest doses of bromids In cases of medium intensity the attacks failed to occur under doses of 0 15 to 0 2 gm (2 to 3 grains) daily, while in the more intense 0 3 gm (5 grains) need not be exceeded No injurious by-effects of any kind have been observed after months of daily administration, and especially no cumulative action has developed Therefore, luminal can advantageously replace the bromids even in the milder cases where these appear contraindicated on account of by-effects

My clinical experience with luminal began toward the end of 1913 in the case of a clergyman's son, whose history is as follows

CASE 1.—A boy, 13 years old was first seen June 4, 1913 The family history is negative Father, a well-balanced clergyman, mother brothers and sisters are well and there is no epilepsy in the collateral branches of that family Born in normal labor, patient developed as other children, with diseases usual in childhood, but no serious illnesses Teething was unaccompanied by convulsions, but there were peculiar spells described by the mother as so called 'inward" convulsion and certain attacks which were undoubtedly those of 'minor epilepsy About thirteen months before coming under my observation a severe nocturnal convulsion occurred—the first major attack—and one month before my examination a similar attack occurred Meanwhile the minor attacks have become quite frequent—five to six daily In these the patient never falls but remains standing and appears dazed for a few seconds only Any slight indisposition such as a cold or indigestion, seems to cause an increase in the number of spells The examination revealed no sign or symptom of organic disease

An acne-like eruption covered the patient's face, due largely to the bromids administered for the attacks My treatment at first consisted in giving the well-known Bechterew mixture—sodium bromid 15 grains, Fowler's solution, 4 drops, in an infusion of adonis vernalis, three times daily Though there was improvement the severe and the light attacks did not entirely disappear and I decided to try luminal in daily doses of 1½ grains The effect was marvelous and almost instantaneous No more attacks were reported and the acne rapidly disappeared The boy progressed in his school studies There were no attacks of any kind during the following two years However, after some indiscretion in diet two slight attacks were noted, but none after that

Shortly after observing the effects of luminal in this case, I cautiously administered the drug in other cases, with similar results

In the discussion following Dercum's paper on Epilepsy with Special Reference to Treatment,[1] read before the Section on Nervous and Mental Diseases of the American Medical Association in 1916, I was the first in this country to express an opinion on the use of luminal in epilepsy Dr Ball, who participated in the same discussion, also emphasized the value of luminal in the treatment of the epileptic attack At that time my experiences was limited to few cases, but since then I had the opportunity of studying over 100 cases of "essential" epilepsy, which constitute the basis for this report

In order to avoid misunderstandings as to what may be expected from the use of luminal, we must be reminded that in spite of the numerous attempts at a rational, or causal, therapy of epilepsy, most of the methods hitherto proposed have proved fallacious, as has been so well shown by Russell G MacRoberts Our therapy is still limited to the prevention of the convulsion or, failing in this, we endeavor to render the attacks less frequent and less severe The convulsion being only a symptom, though the most conspicuous one, we are far from deluding ourselves into a belief that in causing the arrest of convulsions we have succeeded in curing the disease But the convulsion, or its equivalent being nevertheless the one symptom which stigmatizes the individual suffering from it as an epileptic, it is necessary to concentrate our efforts in the direction of ameliorating the epileptic's lot Though we cannot cure his *disease,* we endeavor to influence the *attacks* which make his life so burdensome

It would be wasting time were one to enumerate all the drugs which have been recommended for the treatment of epilepsy It will suffice to state that the bromids have held undisputed sway since their introduction by Laycock in 1857

Physical Properties of Luminal—Luminal, whose chemical name is phenobarbital or phenyl-ethyl-barbituric acid, occurs in tablets of 1½ grains and in the form of a white, odorless and slightly bitter powder It is almost insoluble in cold water, slightly soluble in hot water, soluble in alcohol, ether and chloroform, and in alkaline solution

There is also a soluble preparation of luminal, *luminal sodium,* which is phenobarbital sodium This preparation is principally used for hypodermic injection in the form of a 20 per cent solution prepared by dissolving the salt in boiled and cooled distilled water The dose of luminal sodium is 10 per cent greater than that of luminal

Actions and Uses—The drug was first recommended as a hypnotic and substitute for barbital (veronal), whose formula differs from the latter in the fact that one phenyl group displaces one ethyl group, and it is claimed that this change increases the hypnotic power of luminal (phenobarbital) over that of barbital The dose of luminal as a hypnotic is from 3 to 5 grains, increased if necessary to 12 grains

Method of Administration of Luminal in Epilepsy—I usually prescribe luminal in doses of 1½ grains, either in tablet or capsule, to be given at night before retiring The patient is instructed to report within a few days If the dose administered suffices to reduce the attacks or cause them to subside, it is given regularly in the same manner If this dose is found to be insufficient to cause a cessation of attacks, it must be increased to 2 grains, given at night Should this dose also prove too small, then another daily dose of luminal is added to the preceding one In that event my rule is to prescribe a small dose, say 1 grain, to be given in the morning while the larger dose is administered before retiring Only rarely have I been compelled to give three daily doses of luminal but one need not hesitate when it becomes necessary to increase the dose in order to get results For instance, in one case of severe epilepsy of many years the patient suffered from six to twelve convulsions daily, and nothing less than 3 grains three times daily caused any change in the patient's condition After several days or weeks, it will usually be possible to return to the smaller doses when the effects will be as favorable as with the initial larger doses When drowsiness and apathy appear, it is always time to reduce the dose My invariable rule is to give as little as is necessary to keep the patient

1 Dercum F X Epilepsy with Special Reference to Treatment J A M A 67 247 (July 22) 1916

free from attacks, and no more In cases that have been treated with bromids continuously for long periods of time it is advisable to begin the luminal treatment with somewhat larger doses at first, to be reduced later The treatment is continued for years systematically, any interruption is apt to be followed by a number of severe attacks—the same as with the bromid treatment

A point worthy of mention is the experience that even moderate doses of luminal seem to exert a favorable effect on the minor attacks, while the bromids are comparatively ineffective in these conditions

Contraindications—I know of no definite reasons why luminal should not replace the bromids in most cases of epilepsy requiring drug treatment

Regarding skin eruptions, I can report that among my number of treated cases (100) I have only seen two patients with rashes that necessitated a discontinuance of the luminal treatment

Urinary disturbances from luminal I have never seen, though continental writers speak of their occurrence and advise as a preventive measure to omit one day's treatment out of the seven

On the whole, I believe that there are not contraindications to the administration of luminal in kidney or cardiovascular conditions

To demonstrate more clearly the results of treatment with luminal on the attacks and general condition of epileptics, I have made the following abstracts from the records of several representative case histories

CASE 2—MISS M G, aged 23 with negative family and personal history, came under my observation March 2 1918 Though her health and development during infancy were of the average kind peculiar 'crying" spells without apparent cause are reported by the mother and also the circumstance that even slight illnesses were accompanied by physical upset and high temperatures Menstruation was regular and painless

At 18 while at college, the first "fainting spell' occurred, the second came one year later Then followed several similar attacks in periods varying from six months to one year apart The last attack, one month before consulting me, was attributed by the patient to "shock from dental work"

The first few attacks were accompanied by loss of consciousness, biting of tongue, frothing at mouth and the striking of head against objects encountered in falling Duration of attack five minutes, it is usually followed by severe headache and sometimes by sleep The earlier attacks were more severe than any of the later ones, during the last of which she experienced premonitory warnings in the nature of a 'receding feeling lasting long enough to enable her to lie down before the attack actually appeared In addition to the attacks described, there are present smaller ones consisting of peculiar sensations accompanied by dizziness and lasting only a second—evidently petit mal' attacks

I prescribed luminal in doses of 1½ grains, to be taken at night The results were satisfactory Though the patient has visited me monthly, there has been no record of a single attack since beginning the new treatment This means that not only have convulsions disappeared, but also the minor attacks

CASE 4—W X aged 24 with negative family and personal history, was first examined Sept 13 1914 The beginning of his trouble was while a cadet at a military academy then after a strenuous march he suffered from a so-called 'fainting spell" Within a half year five similar attacks appeared in rapid succession In all of these he became unconscious and keeled over, but consciousness quickly returned These were undoubtedly minor attacks of epilepsy His first major attack occurred two years before consulting me, the second one about a year after the first While the severe convulsions have been coming on an average once yearly, many minor attacks have been noticed in the interval

The administration of luminal in the usual doses (1½ grains nightly) was followed by happy results not one attack has appeared in two years in spite of additional duties imposed on the patient by the necessities of the war Only once or twice has patient suffered mild attacks while taking luminal—always, however, after disregarding essential hygienic rules

CASE 7—Mrs J D first seen, Feb 20 1916, is 54 years old has been married thirty-five years, and gave birth to three healthy children The first convulsion occurred only six months before consulting me, three months after the first came a series of convulsions The examination in this case pointed clearly toward a vascular cause for the epileptiform attacks

The administration of luminal in 1½ grain doses nightly failed to exert any appreciable effect on the attacks The dose was consequently increased to 2 grains There have been no attacks in two years

CASE 8—A Sister of Charity, 22 years old, was seen June 28, 1918 The first convulsion occurred when she was 4 years old Following this there was a long period of freedom from attacks until puberty Then "fainting spells" appeared, and a little later attacks of momentary "abstraction" The last kind of attack occurred very frequently Still later, regular convulsive attacks came to dominate the scene, at first only once or twice yearly but recently every seven to ten days

Luminal in doses of 1½ grains increased later to 2 grains, nightly, caused a disappearance of attacks during the past one and one-half years

CASE 10—H B a factory girl aged 23 under observation since Aug 27, 1918 had suffered from teething convulsions at 1½ years and subsequently was backward in school Two and a half years before visiting me she had her first nocturnal epileptic convulsion There also developed petit mal attacks, consisting of peculiar automatic movements of the fingers, blanching of the face, and momentary losses of consciousness

After the administration of luminal there were no attacks during a period of three weeks Patient considered herself cured and omitted taking the medicine for four days Then a series of attacks occurred, worse than any she had had before

This case seems to support the statement frequently made, that with cessation of treatment, the attacks recur even in greater severity than before taking luminal

In this connection it must be stated that several of my patients returned after having taken luminal for a short time believing themselves cured I always explain to such patients that there is great danger in discontinuing treatment abruptly and that I expect worse attacks than they ever had before if they omit the remedy Such a statement often has the desired effect

In other instances, patients fail to put in appearance and act as though they were cured, neglecting every sort of rule and leading a riotous life A series of convulsions usually brings them to their senses Then they visit the physician and promise to be good For a time rules are adhered to, the medicine is regularly taken, and the patient is again in fine spirits They often fall from grace more than once, before they finally learn their lesson

CASE 12—Mr H F B aged 34 was first seen Aug 30 1918 At 16 years his first convulsion occurred since which time convulsions appeared at irregular intervals There are both major and minor attacks The patient's general health and habits are good and there is no evidence of syphilis A relationship has been noticed between his habitual constipation and the frequency of epileptic attacks

The treatment consisted in regulating the bowels and the administration of luminal tablets in 1½ grain doses Up to the present time there has been no recurrence of attacks

excepting one minor attack For this reason the dose was increased to 1¾ grains of luminal nightly There have been no attacks since and the patient is able to attend to the business of a large banking house

Some of my cases have been free from attacks for a period of three to four years, others from one to two years, and still others, and these constitute the large majority of cases, for a number of months Owing to the scarcity of luminal during the war, I was often obliged to use sodium luminal, of which there was still a quantity left However, the dose is much larger and the effects do not equal those of luminal Fortunately, both products are now being manufactured in America

SUMMARY

Luminal in small doses, from 1½ to 2 grains, once or twice daily, has been found capable of causing an arrest of convulsions in epilepsy

Larger doses than those mentioned are seldom required, but may be safely given

Large doses may be administered when beginning treatment, especially after sudden withdrawal of the bromid treatment, even in such cases the dose may be gradually reduced to what constitutes an average dose, namely, 1½ to 2 grains

No harmful effects have thus far been observed from the long-continued administration of luminal

It does not appear to be a habit-forming drug

The effect on the mentality of patients taking luminal for epilepsy was surprising Patients receiving average doses of luminal do not show the peculiar mental torpor of those taking bromids

25 East Washington Street

ABSTRACT OF DISCUSSION

DR GEORGE A MOLEEN, Denver I can second what Dr Grinker has so well brought out with reference to the sedative power of luminal in epilepsy, and it seems to be more effective in the severer cases I cannot agree with Dr Grinker however, in that it is free from all danger particularly in the renal cases I think it participates in the danger common to all the series of barbituric acids especially in the more commonly used barbital (veronal) as well as luminal and the sodiums salts of these two radicals I have seen uremia precipitated in a case of renal insufficiency which resulted in death, and I am a bit chary about the use of any barbituric derivative in cases in which this complication is a possibility On the other hand, it replaces the bromids with less of the mental torpor that is commonly found with them and even is superior to the von Leube modification of the bromid treatment Even with the addition of the opiates to the bromids I think luminal has a more favorable effect in cases of epilepsy of long standing, but one must be very guarded about its use during convulsive seizures in general for they may possibly be of toxic origin and renal insufficiency may play a part

DR MARVIN L GRAVES Galveston Texas My own experience with luminal in the treatment of epilepsy is not quite so favorable as that of Dr Grinker Unfortunately we have no definite etiology on the pathologic classification of the epilepsies so that we might know just what we are dealing with and apply our therapeutics accordingly It appears to me that luminal will be found to be definitely an antispasmodic or anticonvulsive possessing a considerable degree of efficacy A certain number of epileptics that have been under my care have responded to from 3 to 4½ grains administered daily, the convulsive seizures ceasing, the mental symptoms becoming greatly improved and in all respects the patients appearing to be much better After the patient has taken the drug for a little while, however and then ceases taking it, it is not long before the convulsive seizures recur Moreover, I have seen cases in which luminal, administered in doses as high as 7 or 8 grains daily, has produced no cessation in the convulsions, which, as a rule occur nocturnally, but which are somewhat controlled by the bromids Luminal is a valuable drug in ½ to 1½ grain doses but it is not a curative drug in epilepsy, it is simply palliative, and perhaps, one of the best palliatives

DR ANDREW L SKOOG, Kansas City, Mo It is the general consensus of opinion on the part of students of this disease that epilepsy should be termed epilepsies rather than epilepsy There are many different causes for epilepsy, some we are able to discover, and others we are not These cases are classified as idiopathic or essential epilepsies My experience with luminal has been favorable in many cases I had used it for a short time only before the war, then after a certain period I was unable to obtain any of the drug I did use some luminal sodium but I did not get the same results with this drug that I had formerly obtained with luminal I have begun using luminal again and in one case of a severe type of epilepsy there has been complete cessation of the seizures From a review of the literature and personal experience with the drug I would say that it is worthy of serious consideration, especially in certain types of epilepsy However in view of reports on the toxicity of the drug, we should exercise considerable caution relative to the dosage and period of continuance I wonder whether Dr Grinker has had any cases in which he has discontinued the drug for many months or a year, with no recurrence of attacks In view of the fact that we favor the term epilepsies rather than epilepsy, the therapeutics of this group of diseases must be multiple In a certain number of cases surgical treatment is indicated Hygiene plays an important role particularly as regards diet I agree with Dr Grinker that bromids have been used in excess In Europe it has been the custom to administer considerably larger doses than we use I prefer sodium bromid The toxicity of a bromid may be lessened by certain laxatives particularly cascara and occasionally liquor potassii arsenitis

DR DAVID S BOOTH St Louis My experience with luminal has not been as favorable as I had expected, however the results obtained have probably been as good as those obtained by the use of bromids It is true that bromids have ill effects, but calcium or sodium bromid is the least injurious In those cases in which the bromids cause pustules, there is usually some focal infection

DR E BATES BLOCK, Atlanta Ga I have used luminal in more than sixty cases and my experience has been very favorable I do not give over 3 grains in each twenty-four hours, and that at bedtime It does not cure epilepsy but it has a controlling effect over epileptic convulsions Luminal has an advantage over barbital and chlorbutanol in that it does not have any effect left over the next day when it is given at night I have seen no ill effects from luminal The bromids tend to produce or light up or increase any preexisting inflammatory condition I would not give bromids in tuberculosis nor in any inflammatory condition

DR F B WYNN Indianapolis Generally speaking we continue the use of any remedy with the idea of diminishing the frequency of epileptic attacks I do not know of any drug which has been abused more than the bromids When I was connected with an institution we gave bromids ad infinitum but the longer I remained the less I gave whether for epilepsy or for excited and extreme cases of mental agitation The mental apathy, the developing transient stuporous state of the individual impairment of the digestive functions —all came in the wake of the use of bromids That is what we are apt to do with luminal It seems to me we are getting away from the fundamental principles in treating epilepsy We should keep the bowels free by dietetic and therapeutic measures We overlook the psychogenic factor Chronic epilepsy patients with dementia go for long periods without any epileptic attacks Psychology produces that remarkable result Patients with idiopathic epilepsy who have been treated by all known measures without [illegible] their attacks get well following a [illegible]

It is simply a matter of getting away from an old environment —a different psychology We should apply the principle in the management of cases of chronic epilepsy The physician in charge at our institution in Indiana says that there is a great deal in the psychogenic treatment of epilepsy Vary the patient's occupation and tell him that it will help him, and it will It is strange what a wonderful effect the change and inspired hope will have upon the course of the epileptic seizures

DR ROY M VAN WART, New Orleans About ten months ago I accidentally made the observation that barbital would control epileptiform attacks Experiments with barbital in small doses produced practically the same results as luminal I have treated about 200 patients Patients are usually given from ½ to 2 grains once daily In most cases it seems to act almost instantly It reduces the number of attacks very greatly

DR JULIUS GRINKER Chicago Dr Moleen spoke of convulsive seizures of toxic origin I do not include these among the so-called epilepsies I think there is only one kind of epilepsy, and that is, genuine or idiopathic epilepsy McRoberts wrote a very illuminating article on this subject, which deserves careful perusal Dr Graves objects to treatment with luminal because it does not cure I did not claim to have a cure for epilepsy, but was only offering a substitute for bromid, a drug which has always been used as a palliative When a patient has no more convulsions it does not mean that he is free from epilepsy The convulsive phenomenon is only one of several features which go to make up epilepsy As to whether any of my patients has not been given luminal for a year and remained free from attacks I have not dared take one off the drug for that length of time because of the fear that convulsions may return I have had cases in which the omission of treatment for only a short period caused a return of the attack Dr Booth stated that his results were not as favorable as mine His patients were drowsy It is a question of proper dosage Again in some isolated cases luminal will not take the place of the bromids Nobody has claimed that luminal will affect every case favorably Dr Booth also spoke of focal infection being present in some cases So-called epilepsy due to focal infection is not true epilepsy The bromids do tend to produce acne Some patients have a susceptibility to drug eruptions, and this we attempt to remedy by the addition of Fowler's solution With luminal, however, we do not need Fowler's solution Dr Wynn is opposed to the continuous use of any drug He offers objections to the use of bromids and if these are true, we should discard bromids altogether If he had any experience with luminal, he would not be able to mention any contraindication to its use, and certainly would be in favor of continuing the drug as long as it makes patients comfortable As regards cessation of convulsions because of a change to a new treatment, it is true that most of us have occasionally noticed this phenomenon A patient may say that he has taken bromids for three years but has given them up and now is free from attacks Then something happens and the attacks are worse than ever There are longer or shorter intervals between attacks not necessarily due to treatment Taking a patient off the bromids may precipitate an attack of serial epilepsy or he may be entirely free from attacks This is no argument against the use of luminal, for as a matter of fact, certain patients cannot take bromids, but do well under luminal

Barbital is toxic and habit-forming, and in the few cases in which I used it, the convulsions were uninfluenced whereas luminal has never proved toxic except in large doses and in a few susceptible individuals

Is Your Community Fit?—Who is responsible for the health of your city? Have you a health officer? Does he give all his time to his office? Or are you depending on a busy doctor who accepts this position at a nominal salary for the honor he feels attached to it? It is well to bear in mind the truth of the motto Public health is purchasable in a large measure a community can limit the degree of prevalence of disease within its borders.—*Pub Health Rep*, April 25, 1919

THE VALUE OF POSTMORTEM WASSERMANN REACTIONS*

STUART GRAVES, M D
Acting Assistant Surgeon United States Public Health Service
LOUISVILLE, KY

For nearly six years the Wassermann test has been performed almost as a routine on the blood of subjects coming to necropsy in the pathologic laboratory of the University of Louisville Medical Department and of the Louisville City Hospital In the brief time allotted to this paper it is desired to summarize the findings in this study Statistics and details of the technic are purposely omitted, as these may be found in two previous articles based on parts of the same study[1] In brief it may be said that the clinical method as outlined by Kolmer has been followed

The only variation in technic has been that in the last few hundred tests cholesterinized alcoholic antigens alone have been used, but at least two antigens have been employed in each set and each antigen has been controlled with tubes containing double the dose of that particular antigen No result has been considered if the control containing double the dose of antigen has shown any anticomplementary tendency

No apology is made for the use of cholesterinized antigens Nearly a thousand tests were made with cholesterinized and crude alcoholic antigens side by side It was found that the crude alcoholic antigens missed many early and late lesions, and that the cholesterinized antigens did not give false reactions so far as could be ascertained from clinical data Moreover, the cholesterinized antigens have been found much more delicate in treated cases, and the best clinicians working in correlation with the laboratory have come to depend on the cholesterinized antigens Several reliable serologists have privately expressed the opinion to me that they believed the cholesterinized antigens were the most delicate and did not give false reactions if used properly and titrated frequently enough, but that they employed also a crude alcoholic antigen, because some clinicians mistrusted the other The cholesterinized antigens do tend to become anticomplementary more frequently and more suddenly than other antigens, and must be carefully controlled

The average clinician has no particular interest in a complement fixation test of blood after the patient is dead, but to the pathologist working in the postmortem room it affords a valuable check on gross pathologic diagnoses and frequently solves the postmortem problem, while in medicolegal cases it is of great value if reliable That it is not reliable was indicated in 1918 by Symmers, Darlington and Bittman,[2] who asserted that from 31 to 50 per cent of patients, who gave during life a negative Wassermann reaction, showed at necropsy positive evidence of syphilis, while the Wassermann reaction was positive during

---

life in 30 per cent of the cases which did not show any evidence of syphilis after death In this view they agreed with some of the older German writers [3]

Larkin, Levy and Fordyce [4] answered the paper of Symmers and his co-workers somewhat emphatically, supporting the positive Wassermann reaction as the most constant finding in syphilis, and criticizing the Bellevue men on the grounds of questionable serologic technic and careless survey of pathologic material Certainly our findings in nearly 500 necropsies in which Wassermann tests have been made postmortem do not conform to those of Symmers, Darlington and Bittman, as shown by the accompanying table

RESULTS OF POSTMORTEM TESTS

	First Series	Second Series	Third Series	Total	Per Cent
Class 1 Wassermann tests positive with apparent syphilitic anatomic lesions or positive evidence of syphilis in histories	76	28	20	124	25
Class 2 Wassermann tests negative with no apparent syphilitic anatomic lesions and no evidence of syphilis in histories	161	39	39	239	48 5
Class 3 Anticomplementary specimens hemolyzed or otherwise unfit for use	8	14	27	49	9 9
Class 4 Wassermann tests negative with apparent syphilitic anatomic lesions or positive evidence of syphilis in histories	7	3	3	13	2 8
Class 5 Wassermann tests positive with no apparent syphilitic anatomic lesions and no positive evidence of syphilis in histories	38	26	3	67	13 8
Total	290	110	92	492	100

According to these figures, in 73 5 per cent of 492 cases the postmortem serology harmonized with anatomic findings or clinical histories, usually with both The serums were unfit in 9 9 per cent of cases, the incidence being nearly four times as much in the last series as in the first two This was during the war, when the laboratory was lacking in experienced helpers and was overwhelmed with work It is rare that serum is unfit when the blood is taken with a sterile pipet through a hole made by piercing the seared surface of the right auricle with the hot point of scissors, the blood being kept subsequently in an ice chest Right here it may be said that good results with the Wassermann test, before as well as after death, depend to a great extent on the technic followed in obtaining the serum, a point which clinicians frequently do not appreciate Kolmer has shown that a trace of acid or alkali as low as 1 10,000 affects the reaction sufficiently to give an incorrect reading

In this series positive reactions obtained six hours postmortem agreed with positives antemortem, negative reactions twenty-four hours postmortem similarly agreed

The apparent discrepancies in Classes 4 and 5 of the first two series have been discussed in previous papers In the last series these apparent discrepancies are found in only six cases, or 6 5 per cent

Three of the cases belonged to Class 4, with a negative postmortem Wassermann reaction, and positive anatomic findings

CASE 1 (A 18-22) —A patient with syphilitic sclerosis of the liver, with Wassermann reaction ++++ seventeen months before death was subjected to six months intensive treatment, the postmortem Wassermann reaction was negative

CASE 2 (A 19-1) —A white man, aged 55 of whom no Wassermann test had been previously made, died from aneurysm of the arch of the aorta the postmortem Wassermann reaction was negative

CASE 3 (A 20-7) —A white man aged 21, born syphilitic with a saddle nose and wizened face, who had lived for months with a tracheotomy tube died of starvation caused by stricture of the posterior pharynx

The other cases were in Class 5, with positive postmortem Wassermann reactions and no anatomic or clinical evidence of syphilis

CASE 4 (A 18-29) —A white boy aged 6 years died of generalized tuberculosis and tuberculous meningitis The postmortem Wasserman reaction was ++++ the spinal fluid Wassermann reaction had been negative one week before death The family history was incomplete

CASE 5 (A 19-9) —A white man aged 39 with an incomplete history and no previous Wassermann test, died of lobar pneumonia empyema and acute edema of the glottis The postmortem Wassermann reaction was +++

CASE 6 (A 19-23) —A white woman with no record of a Wassermann test died of generalized tuberculosis The postmortem Wassermann reaction was ++

Of these six, Case 1 is certainly not really contradictory Cases 2 and 3 were undoubtedly cases of late and congenital syphilis, in which antemortem Wassermann reactions are frequently negative In the first series all seven of the cases offering postmortem anatomic evidence of syphilis with negative postmortem Wassermann reactions showed aneurysms, but nearly thirty other cases of aneurysm found postmortem in this laboratory have had associated positive postmortem Wassermann reactions

Of the last three cases, it can only be said that there is no evidence that the patients were not syphilitic Certainly other comparisons indicate that reactions varying from ++ to ++++ mean syphilis without doubt Moreover, it is not remarkable to find 13 8 per cent of positive Wassermann reactions in cases not showing anatomic lesions of syphilis It must be appreciated that many cases with histories of syphilis and positive Wassermann reactions in life do not show anatomic evidence of the disease Moreover, in many of the cases coming to necropsy in this series, the accompanying history charts, while they did not offer evidence of syphilis, did not offer much of any other information, so that, while these cases must be put in this class under the circumstances, they would be put in Class 1 if the histories had been the result of searching investigation

Moreover, it must be appreciated that the lack of anatomic evidence of syphilis is the lack apparent on gross inspection and ordinary microscopic examination, such special search as has been made by Warthin at Ann Arbor would undoubtedly reveal *microscopic* changes characteristic of syphilis in many of these cases

Of the value of the Wassermann test during life there is, fortunately, no longer doubt in [illegible] ids

4 Larkin J J Levy I J and Fordyce J A The Value of the Wassermann Reaction A Reply J A M A **70** 1589 (June 1) 1918

most well informed men "In all the fluctuations of opinion as to the significance and value of this test one fact has remained clear, viz, that a strongly positive reaction means syphilis (barring leprosy and yaws)"[5] Therefore, if proof is offered that the postmortem Wassermann reaction corresponds to the antemortem reaction in the same cases, the main point is proved, namely, that the postmortem reaction is a reliable diagnostic sign of syphilis With this end in view, postmortem results have been checked against antemortem reactions In ninety cases so controlled, there are only eight differences In two, the degree of difference was + and ± These two can be practically disregarded In one, a ++++ reaction seventeen months before death was followed by six months' intensive treatment and a negative postmortem reaction This is hardly contradictory, especially as the negro had a typical syphilitic sclerosis of the liver In another, a male negro gave a history of syphilis seven years before death, had shown a negative reaction *three years and eight months later (probably after* treatment), and showed a +++ reaction after death with an ulcer scar on the penis In two other cases the postmortem reactions of +++ and ++++ respectively had been preceded by fairly recent negative reactions on the spinal fluid These are hardly contradictory, for the spinal fluid is frequently negative when the blood is positive One was in generalized tuberculosis in a white boy of 6 and the other in a case of cerebral hemorrhage in a male negro of 35 This leaves two flat discrepancies in ninety cases, an average of about 2 2 per cent If any series of tests extending over a period of six years show no more discrepancies, which might have been due to error on the part of the persons who took the serums, they can be considered fairly reliable

It seems strange that no more attention has been paid to the use and reliability of the postmortem Wassermann reaction In two recent medicolegal cases, it was the deciding point for the insurance companies No one else in this country has written on the subject, except Moody, Jackson and LeCount,[6] who concluded

> It would seem fair to state that under certain conditions the Wassermann reaction in the fluids collected after death is of value Where the blood or spinal fluids have remained in the dead bodies long enough for postmortem changes to occur in them, then the results cannot be relied on Finally in individuals dying from acute infections, the test is often positive in many instances independently of a syphilitic infection or its absence

With their conclusion that the test is often positive in persons dying from acute infections independently of a syphilitic infection or in its absence, the results in these series do not agree Nor is the fact that a positive reaction is found in cases of tuberculosis or carcinoma at all indicative that the positive reaction is due to these conditions In one case (A 20-20), in which a ++++ reaction was obtained after death from operation for epidermoid carcinoma of the tongue, there was found a typical syphilitic aortitis, there had been a ++++ reaction about two weeks before death Kellert[7] has reported a case of carcinoma, syphilis and tuberculosis coexistent in the same patient

In this connection the views of Moore[8] are of interest Basing his opinion on the study of syphilis from histologic, bacteriologic and clinical points of view, he believes that

> Postmortem appearances interpreted as being evidences of syphilis are the least valuable as proof and often actually misleading contrary to the view expressed by Symmers and Darlington
>
> Syphilis is an anatomic disease, but the postmortem anatomic changes are often better regarded as the results of a disease, of a process which has come to an end before the death of the individual, rather than as the disease itself hence the fallacy of correlating the results of a reaction which necessarily depends on the active disease process, with terminal fibroid changes
>
> The Wassermann reaction presupposes that there are certain substances in one or both of two body fluids, the presence of which is determinable by that procedure
>
> A patient may have syphilis, but if the so-called Wassermann bodies are not present in the blood serum or spinal fluid the result will be negative This may occur in cases of chancre before the end of the fourth week
>
> *A vastly different and more reliable picture is presented* by clinical syphilis than is presented by the postmortem appearance and it is the correlation of the Wasserman test with this evidence that determines its usefulness
>
> Clinical syphilis and the dark field microscope should establish the validity of the Wassermann test in known cases The Wassermann test should establish the presence of syphilis in unknown cases

It is in these unknown cases, which the pathologist frequently faces at the necropsy table, that the postmortem Wassermann test is of great value

In our laboratory more than 15,000 Wassermann tests have been done in hospital and clinic cases in which the clinical evidence could generally be correlated with the serologic evidence, and I am fully convinced, as was Rosenberger[9] in a study of 10,000 Wassermann reactions in the Philadelphia General Hospital, that the Wassermann test is the most delicate and reliable means of diagnosis of active syphilis I am as fully convinced that the postmortem reaction is just as reliable as the test during life, if the serum is properly taken and preserved

CONCLUSIONS

1 In ninety controlled cases there were flat discrepancies between antemortem and postmortem Wassermann reactions in only two

2 In 124 cases showing evidence of syphilis, postmortem or clinical, 137, or 90 5 per cent, gave a positive postmortem Wassermann reaction

3 The reliability of the Wassermann test depends to a considerable extent on the care used in obtaining and keeping the blood

4 Cholesterinized antigens are the most delicate and do not give false positive reactions if properly used and controlled

5 Observation of more than 15,000 reactions as correlated to clinical evidence substantiates the belief that the Wassermann test is the most delicate single test for syphilis

6 The postmortem Wassermann test is practically as reliable as the antemortem test if the serum is properly taken and shows nothing unusual in the serum control tube

ABSTRACT OF DISCUSSION

DR. A. M MOODY, Chicago Dr Leila Jackson and I made a series of tests a few years ago on postmortem fluids collected by Dr Le Count We ran one series at Presbyterian Hospital and another at St Luke's Hospital, and we checked everything very closely At that time, in 1912, there was not a satisfactory collection of fluid in many instances Proper precautions were not always taken in regard to the containers That would account for a large number of anti-complementary reactions which we got at that time Then we made Wassermann tests in every case, many of the fluids were in such a state of decomposition that no valuable result could be obtained Our conclusions at that time were that when a positive reaction is present it is a valuable sign of syphilis, that is in the presence of the lesions of syphilis If other diseases are present which may interfere with the reaction in some way, a positive reaction will not mean syphilis, but in cases of sudden death from a disease other than acute infections it gives valuable information, and especially is that true of the aortic lesions of ordinary syphilis I think Dr Graves has come to the same conclusion We believed at that time that persons dying from pneumonia and other contagious infections did not give reliable Wassermann reactions in their postmortem fluids We examined other fluids besides the spinal fluid, but they all bore out the statement Dr Graves made, except that we found that the Wassermann test was not positive in the case of patients who died of acute infection From a medico-legal standpoint, a positive Wassermann reaction in a patient dying from syphilis should be just as valuable as one made on the living subject

DR WARD BURDICK, Denver It is a matter of great importance that we establish the value of the postmortem Wassermann test Having been coroner's physician of Denver for a number of years, I can recall several instances in which the result of such a test could have been used as evidence, but by reason of there being so little in the literature with reference to its value it had no legal status Have you had difficulty in securing these serums hemoglobin free? What is your technic for securing the specimens of blood?

DR. R G OWEN, Detroit One of the important factors is the question of cholesterinized antigens We realize that the Wassermann reaction is not 100 per cent. accurate and we must make up our minds whether we are going to get false positive or false negative reactions in certain cases You do get a certain percentage of false positive reactions with cholesterinized antigens We recently completed a series of examinations of 2,241 specimens, which were run with cholesterinized antigen, one hour incubation and with plain alcoholic heart extracts with four and fifteen hour fixation in the icebox Five hundred and seventy-one tests were positive with all three methods, 1,558 were negative throughout One hundred and twelve gave different results with the three methods One and one-half per cent were positive only with the cholesterinized antigen, but these were all in old, treated cases, some patients having gone as long as fifteen to twenty years without any definite symptoms There were however, about 3 or 4 per cent of what we considered false positive reactions given by the cholesterinized antigen In these cases, the history and physical findings were carefully reviewed and no evidence of syphilis could be elicited To make a diagnosis of syphilis with a cholesterinized antigen alone is dangerous

DR. F F RUSSELL, Washington, D C In the last hospital where I was stationed we made it a rule to do postmortem Wassermanns We did from twenty-five to thirty postmortems a month, and we came to have a great deal of confidence in the postmortem results, where the body was fresh enough to get a good serum. Dr Graves said that he did not get a positive Wassermann in an acute infectious disease I can confirm that statement. We might get a slight reaction, but nothing that was confusing There never were any strong reactions obtained in yaws or leprosy or malaria unless the patient had syphilis also I do not think that we realize what a common complication syphilis is in leprosy In the leper asylum at Ancon C Z we had between 40 and 50 per cent of syphilitics Naturally, we got a very high percentage of positive Wassermanns in our leprosy cases As time went on, and these patients lived for years, the clinical signs of syphilis became evident To illustrate by one case A man was admitted to the hospital with typhoid fever During the course of the disease he was found to be a leper in the earliest stage of the disease Before he convalesced from the typhoid he developed a primary lesion of syphilis and also a pulmonary lesion His pulmonary lesion did not clear up and it became evident after a time, that he was suffering from acute pulmonary tuberculosis During his typhoid his tuberculosis and his leprosy he had a positive Wassermann, all because he also had syphilis

DR JOHN A KOLMER Philadelphia Did you get a positive Wassermann in your case?

DR RUSSELL We got a weak positive reaction

DR KOLMER A case of yaws in Philadelphia diagnosed by Dr Schamberg gave a positive Wassermann reaction So far as my own experience is concerned, there are only two diseases other than syphilis which may consistently yield positive Wassermann reactions, namely, leprosy and yaws

DR. WARD BURDICK Denver The statement has been made, has found its way into the literature and has become more or less firmly fixed in the minds of many physicians that some tuberculous patients give a positive Wassermann reaction when syphilis is not present I have never found this to be the case

DR KOLMER I can confirm what Dr Burdick said A patient with tuberculosis gives a negative Wassermann even with cholesterolized extracts unless he is likewise syphilitic

DR F M JOHNS, New Orleans I have had occasion to make many Wassermann tests even using cholesterinized antigen on active malaria patients Dr Bass and I took many specimens of blood from very heavily infected patients and series of Wassermanns were made with cholesterinized antigens alcoholic antigens and others of a tentative specific nature for malaria We frequently found a 4 plus Wassermann with a cholesterin fortified antigen and very slight fixation with the alcoholic antigens only These same patients would give a negative Wassermann with cholesterin antigen on the abatement of active symptoms

DR STUART GRAVES, Louisville Ky Frequently in postmortem examinations we make a routine blood culture even in patients who have been dead from twelve to forty eight hours Postmortem Wassermanns are of value if the serum is collected under proper precautions and if the tests are properly controlled They are often of far more value than the routine blood culture The routine Wassermann should be done at each postmortem provided the body is not too old I think we found positive postmortem Wassermanns agreeing with antemortem Wassermanns as late as twelve hours and negative postmortem Wassermanns agreeing with negative antemortem reactions as late as twenty-four hours Often in acute infections we found the serum considerably tinged with hemoglobin In taking the serum the right auricle is seared thoroughly with a hot iron and punctured with an old hot scissors blade Then with a sterile pipet the serum is sucked up and deposited in a sterile tube If the blood appears hemolyzed, or if the controls are not perfect, that serum is thrown out In relation to the cholesterinized antigen it all depends on what is considered a positive reaction We have come to depend on no reaction as diagnostic if it is not more than plus With each antigen carefully titrated and controlled with a double dose of that antigen, a result of 2 plus 3 plus or 4 plus is diagnostic of syphilis but one plus we do not interpret as positively diagnostic, although we consider it as being suspicious It is generally recognized that a Wassermann test properly done is the most reliable means of diagnosing syphilis In checking up the postmortem reactions by antemortem reactions the positive postmortem reactions corresponded almost exactly to the antemortem reactions in about 97 per cent of the cases If in a large series uniform reactions are obtained by two laboratories or by corresponding tests it is pretty reliable.

MILD CHRONIC NEPHRITIS IN CHILDREN *

LEWIS WEBB HILL, M D
BOSTON

Acute nephritis in children is often a very long drawn out affair, a case probably should not be called chronic until albuminuria has persisted at least a year The classification of chronic nephritis, whether it be in the child or in the adult, has always offered considerable difficulty The variations in the clinical picture which may be presented are many, depending on the amount and kind of damage that has been done, and the stage of the disease in which the patient may be at the time The older pathologic classification has not been satisfactory for practical purposes, is gradually being done away with, and is being replaced by a simple clinical classification In children the situation is somewhat different from that in the adult as we do not ordinarily have to take the general wearing out process of the organism into consideration, we are dealing with kidneys that have been suddenly damaged when healthy instead of with kidneys that may have gradually suffered injury due to the wear and tear of life over a long period of time Also, in adults with chronic nephritis the picture is usually complicated by concomitant cardiac and vessel damage, in children this factor does not ordinarily have to be considered

It is best, I believe, in accordance with the teachings of the internists, notably those of Dr Henry Christian, to follow a simple clinical classification in considering chronic nephritis in children—the simpler the better For practical purposes we may divide cases of chronic nephritis in children into two broad groups (1) "ordinary" chronic nephritis, further subdivided into the mild and the severe cases, and (2) chronic nephritis with infantilism, or "chronic interstitial nephritis," as it is more often called—an excessively rare condition in children

The severe "ordinary" cases and the rare "interstitial" cases are represented by somewhat similar pictures in the adult, the mild forms which I wish especially to discuss are seldom seen in older persons The etiology of the condition is usually some infection, with tonsillitis playing the most important role I have never seen a chronic case that I could feel sure was due to dental infection, although this must be a possibility

Chronic nephritis in childhood may present a totally different picture from chronic nephritis in the adult A child is brought to the outpatient department complaining of lack of appetite, loss of energy failure to gain in weight, slight anemia, etc—the common type of outpatient child We examine him carefully and find nothing essentially abnormal We get a urine specimen, and find a small amount of albumin, a few casts in the sediment and perhaps a few red blood cells We then take the blood pressure and find it normal, or perhaps slightly below normal nor is there any hypertrophy of the heart If the urine contains blood and casts, we can be practically assured that we are dealing with a mild case of chronic nephritis If there is no blood and only a rare cast or none at all, the case may be one of nephritis or of orthostatic (postural) albuminuria If the patient has never been seen before, and if the existence of a previous acute nephritis is not obtained in the history, these cases may offer considerable difficulty in diagnosis The patient must be put to bed and several examinations made on urine passed while recumbent and while up and around The second urine specimen passed after the patient has been put to bed should be free from albumin if the case is one of postural albuminuria, and the albumin returns in the specimens passed while the patient is up and around Change from the recumbent to the upright position has, of course, no influence on the presence or absence of albumin if the case is one of chronic nephritis Another point of some importance, which has been emphasized by Janeway, is that the majority of nephritics show only albumin coagulable by heat, while postural cases often show protein precipitated by acetic acid in the cold, which may be euglobulin

These mild cases are not the most common type of case, unfortunately, of our recorded cases of chronic nephritis they represent about one third The heart is not at all hypertrophied, the blood pressure is not elevated, indeed, it is likely to be lower than normal There may be occasional periods of hemorrhage from the kidney, when the urine will contain considerable blood These acute exacerbations may be brought about by any acute infection that happens to attack the child, or sometimes occur without apparent cause, and are likely to be accompanied by slight or moderate edema, but the amount of edema is never excessive I recall one girl who has had in the last four years several such acute exacerbations without obvious cause, and the last time that she was seen, about a year ago, she was apparently perfectly well in every way, and her urine contained no albumin, casts or blood

The various tests for renal function often help in determining the status of these mild cases, and indeed it is in just this group that they help us more than in any other, far more than in the acute or in the severe chronic cases In the mild type of case there are two functional tests which we have found of value (1) the phenolsulphonephthalein test, and (2) the "two-hour" renal test, adapted from that of Mosenthal

The phenolsulphonephthalein test is so well known that it need not be discussed in detail, let me merely say that the normal for a child is higher than for an adult The lowest I have seen for a normal child is 64 per cent and the average of some thirty normal cases was 76 per cent This test is usually not much diminished in mild chronic nephritis, except during the acute exacerbations Indeed, I have seen normal phenolsulphonephthalein tests in several very severe cases in which there was undoubtedly much kidney damage, so a high phenolsulphonephthalein excretion does not necessarily mean that the kidney is normal A phenolsulphonephthalein test below 55 or 60 per cent, however, means in children that the kidney is severely damaged, and would tend to make us give a more guarded prognosis than would otherwise be the case

The two hour renal test is a valuable one, but is so delicate that it must be interpreted with some caution The principle of the test is well expressed by Mosenthal [1]

* Read before the Section on Diseases of Children at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

1 Mosenthal H O Renal Function as Measured by the Elimination of Fluids Salt and Nitrogen and the Specific Gravity of the Urine Arch Int Med 16 733 (Nov) 1915

The kidney expresses its diminished power to functionate by a fixation of its power of concentration The normal kidney yields a urine of medium, low or high specific gravity according to the proportion of fluids and solids that must be excreted in order to maintain the composition of the body fluids at a constant level The diseased kidney, on the other hand, loses this flexibility, and the power to answer the demand for a more concentrated or a more dilute urine no longer exists

We have used this test in children as follows The child is put on a full normal diet containing a considerable amount of protein, especially with the noon meal A capsule containing 1 gm of salt, and a 2 grain pill of caffein sodium benzoate is given with each meal, to take the place of the tea or coffee used in the adult test diet Here we have a diet containing a considerable amount of salt, protein and diuretic material, all of which will stimulate the kidney to its maximum efforts Exactly 10 ounces of fluid is given with each meal, and no fluid or food whatever between meals The urine is collected in two hour periods from 7 a m to 7 p m, and the night urine from 7 p m to 7 a m Then all that is required is to record the specific gravity of each sample of urine The normal response shows a wide variation in gravity between the different specimens, in fifteen normal children there was always a variation of at least eight points between the lowest and the highest The night urine in normal children is small in amount, and almost always has a specific gravity of 1 020 or over The child with damaged kidneys, on the other hand, is unable to vary the concentration of the urine in this way, and the gravity of the individual specimens may vary only one or two points The fixation may be at a high or at a low level, and may be high or low in the same patient at different times I remember testing one girl in 1915 whose gravity was fixed at from 1 005 to 1 007, and in 1917 the same girl showed a fixation at from 1 020 to 1 022 It is apparently the fixation of gravity which is important, and not the level at which it is fixed

This is a most practical test for everyday use There is nothing complicated about it, the food does not have to be weighed, nor is it necessary for the patient to eat all of it, it is merely essential that he consume a good full diet The rules for fluid intake must be strictly adhered to, however This is a kidney test that can be made by any one, and it gives considerable information of value

Children with mild chronic nephritis often show a fixation when the phenolsulphonephthalein test is normal A fixation does not necessarily mean a severely damaged kidney, but it is undoubtedly fair to say that if fixation exists, the kidney function is abnormal The few blood urea examinations that have been made in this type of case have been normal, and I do not believe that the damage to the kidney is ever severe enough to cause a marked urea retention I should expect to get no information of value from blood urea determinations in these cases

TREATMENT

A French writer, Hutinel,[2] ten years ago wrote

> Let me insist that in dealing with these nephritic children it is especially important to pay attention to careful nursing and hygiene It is by these measures that the malady is cured or, in the more serious forms that life is prolonged Use drugs as little as possible Especially is it important not to irritate the kidney and to forbid the patient eating any substances whose end-products he cannot eliminate It is necessary moreover to do away with any coexisting infection however insignificant it may appear, and to watch carefully the mouth, digestive tract respiratory apparatus and skin In a word one must remember that the kidney is delicate, and spare it as far as possible

These words sum up most succinctly in one paragraph the general principles of treatment of mild chronic nephritis in childhood The details of the treatment may be considered under two heads

1 *General Hygiene*—General hygiene is, I believe, of far more importance than the diet The lives of these children should be most carefully supervised In this modern day all of us are continually seeing children who are overtired, overtired from too much school, too much music lesson, too much excitement too much everything The strenuous life must be strictly forbidden to these nephritic children They must be treated along the same lines that Dr Smith of New York and Dr Emerson of Boston have insisted on for their classes of underweight children—plenty of rest both physical and mental, and plenty of suitable food The question of sea or fresh water bathing often comes up, and I have had a good many mothers with nephritic children ask whether this may be allowed I do not see any reason for forbidding a nephritic child to bathe in warm water, that is, 70 F or over, but should certainly forbid it if the temperature of the water was below this Chilling of the body surface is not good for a nephritic, and it is not unusual to have hematuria or albuminuria increase if this occurs

The tonsils and teeth should receive very careful attention Certainly if the tonsils have been the cause of the nephritis, as they undoubtedly are in a great many cases of this mild type, they should be removed, and even if they have not been apparently the original cause of the trouble, they should be removed if there is the slightest suspicion that they are at all diseased Although dental infection is probably not at all a common cause of nephritis in children, the teeth of a nephritic child should be attended to and any existing focus of infection eradicated It is of the utmost importance to guard the child against all sorts of acute infections, such as colds, bronchitis, or measles, as *often these conditions, while not serious in themselves*, may cause a flaring up of the nephritic process The kidneys of these children are hypersusceptible, and they should therefore not be called on to excrete toxins of any sort If an acute exacerbation occurs, the child is of course put to bed, and is treated the same as an acute case would be

2 *Diet*—While it certainly would not be wise to allow an unrestricted diet to these children, it is a worse mistake to restrict it too closely There is no reason for omitting meat entirely from the diet, nor is there any good evidence that red meat is any less desirable than white It is not at all certain what the minimum protein requirement of any child is, but it is undoubtedly a considerable amount, and in a long drawn out condition such as chronic nephritis, there is no necessity of depriving the child of meat Meat once a day will certainly do no harm Meat soups I do not believe in, as their food value is practically nil, and it is possible that the kidney might be injured by the considerable amount of extractive material they contain There does not seem to be, however any actual proof that meat soups do harm though all writers on

2 Hutinel Bull med 24 95 1910

nephritis are agreed that they should not be given Epstein's high protein diet does not come into consideration here, as this is a nephritis with little or, at most, moderate albuminuria, and large amounts of albumin are not being lost from the body, as in the cases to which he refers If a child likes his food very salty, this taste should be discouraged, otherwise there is no especial necessity for salt restriction For the severe cases of chronic nephritis with edema a low salt intake is, of course, desirable

Water is one of the best therapeutic agents there is for many diseases, and a nephritic child without edema should be encouraged to drink water in order to keep his urine at a low specific gravity, and to dilute the products that are excreted through it

The diet of these children may be thus summed up meat, fish or eggs once a day, no meat soups, a moderate salt intake, and plenty of water Otherwise the diet can be the same as for any other child

3 *Prognosis*.—The prognosis of any diseased condition is what, after all, interests the patient most There are three prognostic possibilities to be considered in mild chronic nephritis First, the kidney may recover entirely, after a period of several years' albuminuria Secondly, a severe and fatal chronic nephritis with large amounts of albumin in the urine, and edema, may supervene, and thirdly, contracted kidney may develop, giving rise to the clinical picture known as chronic interstitial nephritis The first two of these possibilities I know may occur, but I have followed no cases long enough to be sure of the third The reparative power of a growing child is remarkable, and it is quite possible to recover entirely from this mild type of nephritis I have seen one patient apparently recover after four years of albuminuria, and another after two On the other hand, not a few cases get worse, particularly after each acute exacerbation, and on the whole, the chance for recovery is probably not as good as for the development of a severe nephritis in the course of time The functional tests already referred to are of considerable value in prognosis Repeatedly low phenolsulphonephthalein tests usually indicate a bad prognosis, and yet I can recall one girl who never has had a phenolsulphonephthalein test above 40 since the development of her nephritis, and who is still alive and apparently getting on very well after five years Normal phenolsulphonephthalein tests are not of much value in prognosis, as it is possible for severe kidney damage to exist with phenolsulphonephthalein outputs of from 60 to 70 per cent If a child has a normal two hour test, on the other hand, his kidneys are probably only slightly damaged, as this is a very delicate and reliable test An abnormal two hour test, with a considerable degree of fixation, means a damaged kidney, but not necessarily a severely damaged one By the combined information which these two tests give us it is possible to get a fair representation of the kidney's functional power In acute nephritis it is possible to estimate the severity of the kidney damage by the general condition of the child—in the mild type of chronic nephritis, when the child looks fairly well, and when the urinary examination does not tell much regarding the degree of kidney damage, the functional tests may help a good deal As Sir James McKenzie once said, prognosis of chronic disease is what most of us know least about, as we often lose track of our patients after a few years, and it would be necessary to follow a large number of these cases over a period of at least ten years in order to have any really adequate idea concerning their prognosis

ABSTRACT OF DISCUSSION

DR C F WAHRER Fort Madison, Iowa These affections are seldom primary They are secondary to rheumatism, often cardiac conditions, and sex The boy has a good deal to do with it He goes fishing all day, for instance, crosses the creek and comes home wet, or in the wintertime he indulges in snowballing, and gets thoroughly wet In the case of a girl, the present tendency of dress will not help a great deal We are told that diet has a great deal to do with it Diet is an important factor, as is also the wearing of proper clothing in the cooler parts of the year Do not bear too heavily on drug treatment, because although you may succeed for a short time, you might awaken an exacerbation of a nephritis in one of these chronic cases The prognosis is favorable rather than unfavorable The majority of patients will ultimately recover though so gradually that only repeated tests will satisfy you that the patient is doing well

DR JOHN LOVETT MORSE, Boston One of the hardest things to determine in connection with this class of cases is when a subacute nephritis ends and a chronic nephritis begins, because almost all of the cases start as an acute hemorrhagic nephritis, become subacute, and then finally chronic I have never quite made up my mind as to what it was in the urine that showed when a case was subacute and when it was chronic, or as to what length of time made the diagnosis The vast majority of physicians are satisfied when they get the urine free from albumin in acute nephritis They examine the urine find no albumin and call the patient well You cannot call a patient well on one negative examination for albumin The patient is not well until his urine is clear when examined microscopically after being centrifuged My plea, therefore, is to endeavor to prevent the development of a chronic nephritis by sufficiently long treatment of the acute nephritis, and to prevent it by the same line of treatment Dr Hill mentioned in speaking of the curative treatment

DR GEORGE DOW SCOTT, New York In one hospital we have quite a number of nephritis cases after the acute contagious diseases The younger the patient the quicker the recovery Urine examination should be made always and it is interesting and instructive to see the urine change for the better often from day to day I take issue with Dr Hill in giving animal proteins in such cases Clinical experience would warrant me in choosing the vegetable and fruit proteins instead Frequent bathing and open fresh air are essential

DR H M MCCLANAHAN, Omaha Twenty-seven years ago I attended a child with scarlet fever, complicated by acute nephritis of the hemorrhagic type, and general anasarca The child was seriously ill, but recovered I have kept in touch with that young man until the last two years He was a football player and an athlete He is a very well man On the other hand, a girl who recovered clinically from acute nephritis again developed nephritis two years later, probably as the result of a tonsillar infection, and died I wonder whether in any of these cases an acute acidosis developed as in nephritis in the adult, and if so what the treatment was

DR LEWIS WEBB HILL, Boston I have not seen any acidosis in these cases I believe it is more likely to occur in adults with contracted kidney than in these children I do not mean to say that chronic nephritis in childhood, as a rule, is mild, because that is not so The particular type of case I was speaking about today is mild Children have very severe forms of nephritis just the same as adults And many of them die from it As Dr Morse said, it is very important to pay a good deal of attention to the urinary sediment before discharging the patient A little albumin in the urine I would not mind much, providing the sediment were perfectly clear but if there were still a few red blood cells in the sediment I should be very careful about letting that patient up I said that I would begin to call a case chronic after it had been going for about a year That is purely arbitrary, and possibly some people would not agree with that

UMBILICAL CONCRETIONS

REPORT OF CASE

MILES F PORTER, A M, M D
FORT WAYNE, IND

History—Mrs C E C, housewife aged 62 married thirty years, sterile, was referred to me by her family physician because of a tumor in the umbilicus The menses came on at 12 years, when she flowed freely for more than a week and then stopped for a year, and was never regular afterward She never flowed enough to require a napkin The menopause occurred at 52 The patient had lung fever when 12 years of age She had had stomach trouble for fourteen years which at one time was pronounced gastritis and two years before I saw her the diagnosis of cholecystitis was made She had had a great deal of stomach distress and vomiting with no typical gallstone colic and no jaundice She had had a black spot in the navel for three years When 16 or 17 years old she had an attack of inflammation of the umbilicus accompanied by swelling, redness pain and discharge of pus and was in bed for about a week The family history was negative except that the mother died at 52 years of age from rupture of the gallbladder, and one sister had a tumor of the breast removed fourteen years before I saw the patient Her general health was quite good, but she was annoyed by a lump in the navel which had appeared a month before and which at times felt quite sore

Examination—The patient was well nourished rather short in stature, and of medium complexion The chest was negative The abdomen was covered, especially in the upper part with a large number of pigmented moles On the right was one as large as a kidney bean and papillated, and which the patient said "shed its seeds" at times A very dark tumor was present at the orifice of the navel, which orifice was three-sixteenths inch in diameter There was no abnormality of the skin about the navel and no discharge It could not be determined positively whether or not the tumor extended into the abdomen The tumor seemed to be about the size of a filbert, hard and quite tender There was marked tenderness over the gallbladder, but no tumor Based on the history and examination, a diagnosis was made of pigmented mole of the umbilicus and chronic cholecystitis In view of the possibility of malignancy together with intra-abdominal involvement, it was advised that the abdomen be opened and that further surgical procedure depend on the findings

Operation—A short vertical incision was made in the epigastrium through the inner border of the rectus There was found no intra-abdominal extension from the umbilicus The gallbladder was thin and contained many stones The incision was enlarged and cholecystectomy was performed The peritoneal cavity was closed with a small roll of rubber dam placed at the upper end of the wound for drainage The umbilicus with the contained tumor was excised by an elliptical incision down to but not through the peritoneum This wound joined the vertical incision at its lower end at right angles Closure of the wound was now made in the usual way The large mole on the right of the abdomen above referred to was excised

Postoperative Findings—The walls of the gallbladder seemed normal to the unaided senses, and contained a small amount of yellow mucilaginous bile and a number of light colored mulberry calculi The opening in the navel was enlarged by an incision whereupon it was found that the tumor consisted of a firm hard collection of skin detritus which could be delivered from its nest after the opening was enlarged The concretion after delivery was found to be spherical with a nipple-like projection which was dark brown while the rest of the concretion was pearly white in color

COMMENT

The criticism may well be made in this case that a closer examination of the umbilicus would have revealed the true condition, which could have been cured by enlarging the umbilical orifice and removing the concretion As we believed that we had a mole to deal with that was possibly malignant, all unnecessary manipulation was avoided as dangerous However, here was a woman of cancer age, with a number of pigmented moles on the abdomen, one of which was annoying her at times, and a pigmented tumor of the umbilicus, which could be seen though a narrow opening at the bottom of a rather deep well, and with a chronic cholecystitis Cancer of the umbilicus is usually secondary to cancer of the stomach, the intestine or the gallbladder,[1] and cancer of the gallbladder is superinduced by gallstones and infection of the gallbladder In view of all the facts the course as outlined above was decided on The question of an umbilical concretion was not entertained If it had been, the result would have been a trivial operation relieving the patient of the concretion and leaving her with her gallstones and quiescent cholecystitis with the attendant dangers of this condition As it is, the woman is relieved of both her gallbladder disease and her umbilicus, with its contained concretion Such a mistake may occasion some little chagrin to the physician, but it leaves the patient with no cause for regret That my confreres may avoid the little annoyance that was mine because of this mistake is one of the reasons for this paper

Umbilical concretions are rare Gould and Pyle[2] refer to two reported cases, and Cullen[3] in his classic work reports twenty-eight cases No reference was made to the subject in quite a number of works on surgical diagnosis, pathology and tumors consulted in the preparation of this paper So far as I know, Cullen's work is the only one which treats the subject in a thorough way, and I have drawn on it freely for the facts that follow Rarely is the condition recognized until some complication calls attention to it Pain referred to the umbilical region is usually the first symptom noted, but the pain may be referred to the whole abdomen, very severe, cramplike periodic and sometimes leading to the extrusion of the concretion In the majority of cases the symptoms are those of local infection but occasionally these symptoms are removed a short distance from the umbilicus

Chronic or periodic discharge from the umbilicus accompanied by signs of infection, should lead one to suspect the presence of a concretion The condition has been mistaken for cancer, tuberculosis and dermoid cyst, and, in one case at least, it was the cause of a primary cancer Granulomas quite frequently form as a result of the long continued infectious process, and these may be and indeed have been mistaken for cancer The condition but seldom leads to serious consequences, and, as Cullen says, "The history of these cases is characteristic and there should be little difficulty in establishing a diagnosis" It is pertinent to add that there would be little difficulty in establishing the diagnosis in a given case provided the physician during his examination had in mind the condition

The treatment of course, is simplicity itself consisting of dilatation of the opening, complete removal of the foreign substance and cleaning of the cavity Prompt recovery always follows

1 Keen W W Surgery Its Principles and Practice Philadelphia W B Saunders 6 446 1913
2 Gould and Pyle Anomalies and Curiosities of Medicine 1897 p 792
3 Cullen T S The Umbilicus and Its Diseases Philadelphia W B Saunders 1916 p 250 et seq

Umbilical concretions are more common in males than females As a matter of interest, it may be well to call attention to the fact that this woman was sterile, that she did not menstruate normally, and that she had a more than ordinary growth of hair on the face

A CASE OF CEREBELLAR ABSCESS DIAGNOSED POSTMORTEM

ABRAHAM LOBELL, M D
NEW YORK

History—A man, aged 29 born in Germany, whose parents, one sister and four brothers were living and well, who showed no hereditary predisposition to tuberculosis or diseases of the nervous system, who denied venereal infections, and who had been married recently, was struck over his right ear with considerable force seventeen years before, by his schoolteacher He fell against an object, subsequently suffered from pain and a purulent discharge from the right ear for a long time, and his sense of hearing became impaired on that side Since that time the discharge had recurred about once every year up to about seven years before I saw him, during which period there had been no recurrence There was an indefinite history of occasional dizziness and slight headaches, but he had no vomiting vertigo or any disturbance in walking There was no cough, expectoration or loss of weight His appetite was good digestion perfect and bowels regular He drank beer and smoked in moderation He slept well and worked as foreman in a sausage factory About two years before his right foot had been operated on From the description of the case I judged it to have been an osteomyelitis of the metatarsal bones The wound healed promptly and had remained closed since The origin of the infection was unknown at that time There was no history of trauma

The present illness dated back to Feb 13 1920 It began with frontal headache blocking of the nasal passages, chilly sensations muscular pains and slight fever The patient considered it an ordinary cold The next day he perceived pain in his right ear and noticed some moisture The frontal headache shifted to the right parietal region It was a sharp and boring headache He consulted an ear doctor in his office, and received some drops for the ear and the day after he was somewhat relieved However the next day the headache and fever reappeared He received some additional treatment and was relieved for a few days

February 21 his symptoms reappeared and I was called to his home for the first time His chief complaints were frontal and right parietal headaches, slight pain in the right ear blocking of the nasal passages, pains in the lower extremities, anorexia and some fever

Physical Examination—The patient was 5 feet 8 inches in height and weighed 160 pounds He did not appear very ill His respirations were normal the temperature was 101 F, and the pulse 96, of good quality and regular The skin and mucous membranes showed a slight degree of anemia There were no enlargements of any lymphatic glands There were several scars on the right foot The pupils were normal in size and shape equal and reacted to light and accommodation There was no nystagmus There was no palsy of any ocular muscles The eye grounds were normal He had a hypertrophic rhinitis a deviation of the septum to the right, and a prominent superior turbinate on the same side The olfactory function was present The right eustachian tube was blocked by mucus The pharynx was markedly injected, it had the reddish appearance that we often see in grip cases The left tympanic membrane was normal in appearance and hearing was perfect on this side The right external canal contained a small amount of mucopurulent material The drum had a gray necrotic appearance and showed an irregular postero-inferior perforation The hearing was markedly impaired on this side The right mastoid process was slightly larger than the left, but there was no redness or swelling, and no tenderness at any point The heart lungs and abdominal organs were negative There was no Kernig sign, no Babinski reflex, and the knee jerks and the reflexes of other parts of the body were normal The urine examination was negative

Treatment and Course—In view of the fact that the chief complaints were those we usually find in grippal infections, it was natural to suppose that such infection had awakened the old ear condition and that therapy ought to be directed toward the primary cause Accordingly, I ordered absolute rest in bed, plenty of fresh air, proper hygiene and diet the usual internal medication and local treatment for the ear, nose and throat The results were very encouraging The patient improved every day The temperature remained normal without any antipyretics The appetite reappeared, and convalescence was rapid February 27, he was up and about, feeling perfectly well his general appearance improved, and the discharge of the ear diminished considerably He demanded to be permitted to resume his vocation, but I cautioned him to take another week for recuperation Against my advice, he went to his place of business and celebrated his recovery with beer and sausages This resulted in some gastro-intestinal disturbance, but it cleared up promptly

Second Attack—March 4, I was called and found the patient complaining of virtually all of the original symptoms It was reasonable to assume that he suffered from a relapse a common occurrence in grippal infections and the previous treatment was immediately instituted Within twenty-four hours after this, I was convinced that he did not respond to the treatment so well as previously The headache was not relieved It was more agonizing, intense and boring in character He showed signs of pain in the face He had no vomiting and no dizziness The urine examination was again negative

In the presence of a chronic ear discharge, the first inclination was to explain the aggravation of the symptoms by a deep seated progression of the infection into the neighboring areas of the middle ear There was no tenderness over the mastoid Pressure and percussion over the skull elicited no tender area The headache was most intense over the right parietal region I urged immediate hospital observation in order to obtain the aid of a neurologist aurist roentgen ray and laboratory Having some prejudice against hospitals, they refused my advice and were willing to obtain such services at home

A roentgenogram revealed a marked difference between the right and left mastoids The cells of the right were entirely obliterated and a definite involvement of the mastoid was thereby pronounced However, the absence of clinical evidences of a mastoiditis led one to suspect a brain abscess A neurologic examination failed to reveal any signs that would localize a destructive area of brain tissue There was no functional disturbance of any cranial nerves, especially the optic nerve The sensorium was perfect He perceived and localized pain, touch, heat and cold The reflexes were normal and equal on the two sides of the body Muscular coordination was perfect There was no staggering gait, no scanning speech The field of vision was not contracted There was no diplopia A lumbar puncture was negative, except that the pressure was rather high There was no vomiting no bradycardia, no rise in blood pressure Up to that time there was no excitation, such as delirium, and no depression such as drowsiness or stupor However, during the night of March 5, there was a sudden change The headache became unbearable delirium set in and increased continuously up to the time of operation March 6 Dr I M Heller examined him and convinced the people that he must be operated on immediately

The history, present physical findings and roentgenogram pointed to an intracranial infection of otic origin Ordinarily, one would first attempt to localize the remote brain infection in order to determine which part of the cranium should be trephined whether or not it could be reached through the mastoid route But in this case in view of the sudden alarming symptoms, procrastination was contraindicated The plan was to explore the mastoid a procedure advocated by most aurists, especially in cases in which a brain abscess is not

localized The object of this is manifold The primary focus should be exposed in the mastoid and the track of infection traced to facilitate the localization of the abscess in the cranium, to establish temporary drainage in those cases in which a definite localization becomes impossible or the patient's condition does not permit any further exploration at this period

March 6, at 3 30 p m, the operation was started with ether anesthesia The usual radical mastoid operation was performed The unusual findings were an absence of all landmarks due to previous inflammatory processes The cortex was exceedingly dense and sclerosed There were no mastoid cells encountered, no pus was found until the antrum was reached, and there we found only a few drops A search for a track leading into the cranium was unsuccessful There was no necrosis or softening of bone at this point that would permit the passage of a probe The operation was very difficult and the necessary speed could not be employed In the first place, the dense bone prevented the operator from using the rongeur, an instrument that saves considerable time Secondly, the sinus was in an anomalous position It was through skill and vigilance that the sinus was saved Throughout the operation the condition of the patient was not satisfactory He was cyanotic and the respirations were irregular The operator was compelled, under these circumstances to give up the plan of entering the cranial cavity at this stage He felt that it would be to the best interest if he postponed further manipulations until the patient rallied Unfortunately the patient died in the ward shortly after the operation, from paralysis of respiration Dr Brakestone of Lebanon Hospital House staff performed a partial necropsy and found a cerebellar abscess The cultures revealed a mixed infection, with a pneumococcus as the predominating organism

COMMENT

This case is a concrete example of the serious complications to which the human organism is subjected in the presence of a chronic focal infection In this man, it was the cause of a cerebellar abscess and very likely the osteomyelitis of the foot

Did this man walk around with a so-called latent abscess, lying dormant for many years and only aroused to mischief by an intercurrent secondary pneumococcus infection? That this is not uncommon in spite of the absence of definite symptoms, has been established by numerous observers To explain how this takes place it is necessary to recall the cardinal symptoms and signs of a cerebellar abscess, namely, headache, mostly occipital, persistent vomiting, dizziness, vertigo, staggering gait, etc These are the very signs and symptoms of a labyrinthitis, a condition invariably associated with cerebellar abscess in those instances in which the infection travels by contiguity through the labyrinth from the mastoid to the cerebellum However, in those cases in which the infection travels through the small veins from a necrotic area in the cells of the mastoid, the destruction of the cerebellar tissue is a slow and gradual process, and the labyrinth remains intact, capable of taking up the function of the cerebellum It is for this reason that in this variety there are no signs and symptoms, and the Barany test is also negative In addition to the labyrinth, the destruction of cerebellar tissue is also compensated by the cerebrum, the vestibular nuclei and the sensory tracts

We may inquire into the immediate cause of the death in this case, but a true explanation is only problematic In other reported cases of similar outcome, it was thought to have been caused by the pressure of the abscess on the medulla, as a result of an increasing edema from ether congestion of the brain It is for this reason that some authorities advise judicious and careful administration of chloroform in preference to ether in diagnosed cases of cerebellar abscess, believing that it produces no congestion in the brain Another important factor must be considered in the causation of immediate death, and that is the performance of a lumbar puncture while the patient was still on the operating table, about twenty minutes before he died Although only 10 c c of cerebrospinal fluid was withdrawn under apparently high pressure, nevertheless it must have influenced the pressure of the abscess on the vital centers in the medulla, especially the seat of respiration This is in accord with the established dangers of performing lumbar punctures in cerebellar tumors or abscesses

It may be of interest to recall that the most deceptive element in the course of this man's illness was the fact that he improved and was well for a while This interval of well-being usually diverts our attention from the suspicion that we are dealing with a serious disease This interval has occurred in many cases that are recorded, and some observers have come to look on this as a characteristic feature of the course of the disease

OBSERVATIONS ON THE SALT CONTENT OF HUMAN MILK*

WARREN R SISSON, M D
AND
W DENIS, PH D
BOSTON

While in practice slight variations occur as a result of individual experience, the fact is generally recognized that the "normal" or standard amount of fat, carbohydrate and protein to be used in the diet of infants has in a large measure been established It is also recognized that a large class of infants when fed on so-called "rational mixtures" or even on breast-milk may develop intestinal disorders In the treatment of such infants, attention has heretofore been directed entirely to the attainment of a proper adjustment of the relative and absolute proportions of the fat, carbohydrate and protein, with an absolute disregard of the mineral constituents of the food, the practice being, of course, based on the assumption that the salts are present in excessive amounts even in human milk, and that this excess has no deleterious effects on nutrition

About a year ago we embarked on a study of the mineral constituents of human milk and of the various modifications of cow's milk ordinarily used in infant feeding Our objective was to obtain evidence as to whether some of the more obscure nutritional disorders of infants might be due to abnormalities in the mineral content of the food, as it is perfectly conceivable that an excess of inorganic salts may be as deleterious to nutrition as a deficiency

In this report only the chlorids of human milk will be considered

As the result of the examination of about 400 samples of milk, taken from the first day to the seventeenth month of lactation, we have found that after the first

* From the Department of Pediatrics and the Chemical Laboratory of the Massachusetts General Hospital
Read before the Section on Diseases of Children at the Seventy First Annual Session of the American Medical Association New Orleans April 1920

week, during which slightly higher figures prevail, the average chlorid content of breast milk varies but little, being about 50 mg per hundred c c of milk[1] This is about the average figure given in most textbooks We feel, however, that these average figures are of little practical importance on account of the huge variations that may occur

It has been found that mothers may give milk with a constant chlorin content as low as 20 mg per hundred c c or as high as 110 mg Also, it has been noted that certain mothers show a variation of 100 per cent or more in the chlorin content of specimens of milk obtained over a period of from twenty-four to forty-eight hours Our attention has been directed to the problem of ascertaining the cause and significance of this variation The effect of diet on the chlorin content of milk has been studied from an experimental point of view and will be reported later

From our present observations on human milk we feel that diet is not the essential cause in the variation in the chlorin content, and that some other factor must play an important part

As it is well established that the percentage of chlorin in the blood is constant, it seemed possible that the threshold for chlorin secretion may vary in different subjects and also may be very unstable in certain mothers, and thus explain the variation found in different specimens As many of these mothers were well known to us it was possible to study their history, and it was found that in most instances the stable, phlegmatic type of mother gave a milk that showed essentially no variation in the chlorin concentration in specimens collected every three hours during the day The mothers, on the other hand, whose milk showed marked variation in almost all instances were very unstable types There was no constant relation between the amount of milk obtained from these mothers and the chlorin content of their milk It was interesting to note that the babies of the stable phlegmatic mothers giving an adequate amount of milk always gained satisfactorily, while in many instances the babies of the "nervous" mothers often developed diarrhea and failed to gain normally

These observations on the chlorin content of human milk emphasize the great variation of this constituent, and we feel that while this fact alone may or may not be of chemical importance, it may be an index of abnormalities of some of the other mineral constituents

ABSTRACT OF DISCUSSION

DR FRITZ TALBOT Boston I have watched this work in its progress It opens up some very interesting possibilities When we are feeding a baby on a whole milk mixture, for example, and for various reasons put it on a mixture of whey, cream and sugar, sometimes that baby has a diarrhea Very often babies on the breast also have more movements than they should have This work suggests that sodium chlorid has something to do with the diarrhea It does not tell us why one baby can take a high sodium chlorid content in the milk, and why another baby cannot, but the coincidence is such that it is very suggestive that that may be the basis of some of the diarrheas Another interesting fact is a clinical observation that Dr Sisson made, that the character of the nervous system of the mother who has the high chlorids in the milk is apt to be less stable than of the mother whose milk is supposed to be normal Of course, much more work must be done on this subject to settle exactly what it means but it is a new field, and it opens up very interesting possibilities

1 *The details of these analyses will appear in a forthcoming publication*

THE PROGRAM OF THE AMERICAN RED CROSS*

ERWIN A PETERSON, M D
WASHINGTON, D C

I want you to forget, if possible, all of the definitions which you have already heard with reference to the Red Cross program

One cannot think of any organization entering on any kind of program unless it very carefully examines itself to see whether it is the kind of organization which should proceed with that program Therefore, let us bring our thoughts together (I know you have thought about it, and I want to think with you) and get the data before us, before we consider the final points The first question is this

What kind of an organization is the American Red Cross?

Again will you please forget the definitions of the American Red Cross which you have heard

COMPOSITION OF THE AMERICAN RED CROSS

First, the American Red Cross is an organization of about 25,000,000 folks—members Now don't think that we are unaware that numbers of folks have become members of the American Red Cross by being buttonholed in hotels or on street corners and having a dollar extracted from them But a large number of folks are members of the American Red Cross because they choose to be It is, then, an organization of some 25,000,000 members grouped into chapters, auxiliaries and branches, scattered all over the United States and the possessions of the United States

Second, it is an organization of which 10,000,000 members have had definite practice in service for other folks Now, there is a good deal of difference between having an ideal of service and having actually spent your time and muscle in service The American Red Cross is an organization which has probably 10,000,000 members who have taken some time away from their daily tasks and have given that time to the service of other people They are attuned, if you will, to service on behalf of the other folks

The American Red Cross is composed of members whose service has had a romantic background There is considerable importance attached to the fact that a service is backed by romance, and the service that has been given by the millions of members of the American Red Cross has been backed with such romance as to add a greater significance to the emblem of the American Red Cross

The American Red Cross is composed of members whose service has brought to them certain rewards It is true in child training that the thing which a child does the next time is the thing that brought joy the last time" In this respect, most of us are just grown up children—the things we tend to do tomorrow are the things which brought us satisfaction yesterday Thus, service which was rendered on behalf of humanity, service to other folks which has brought the approbation not only of our countrymen but of the world, tends to be repeated or continued tomorrow We have experienced satisfaction as a

* *Read before the Section on Preventive Medicine and Public Health at the Seventy First Annual Session of the American Medical Association New Orleans April 1920*

result of having served, therefore we are inclined again to undertake service in the same way, in the same field tomorrow This inclination is a tremendous power which we must take into account when we consider the American Red Cross as a force The service given by American Red Cross workers is a service rendered under a definite banner, a banner which has stood for service for a long time, a banner which has been added to by all of these services so that when one sees the American Red Cross today one sees much more than just two crossed red stripes There has been woven into that banner so much of romance, so much of feeling of satisfaction, that there is a tendency, not a great tendency, mind you, nor is there a tendency on the part of all people, but there is a tendency on the part of many of those who have served under or supported that banner to continue—to "carry on"—under its leadership They had carried out that idea It makes no difference that there are other forces in the field which might expand to do things which the Red Cross is proposing to do The Red Cross is ready now When a better fitted or more logically chosen organization is ready to accept and carry on the responsibilities of any work begun by the Red Cross, an adjustment will be desirable and can be made

Meantime, here we have a big national organization composed of workers, and people ready to support those workers Here we have a nation awake as never before to its social needs—and large among these are health needs Shall we discard this organization because the emergency which necessitated its rapid development and expansion has ceased to exist? Shall we begin again at the bottom (or at the near-bottom of coordinating other people's beginnings), to build up a similarly great force, with a similarly great backing? Can the directors of the American Red Cross say to you social health workers 'We will junk this whole thing and let it die, because we don't need such a standing army for emergency work, but we know there is much peace time work for such a social force as the American Red Cross"?

Should we not rather say "Here is a great social force born for service ,Here is a great opportunity for national service How can this organization help to meet the country's needs? Where can the American Red Cross Service spirit best serve the American nation? What piece of work in the general peace program of reconstruction and new construction is the Red Cross best fitted to undertake?"

RECORD OF THE ORGANIZATION

It seems to me that the second point that we must discuss with reference to a program is the record of an organization Therefore we ask "What is the record of the American Red Cross in the field of health?" because we are talking about a health program

I want to go over very rapidly some of the things that would indicate the record of the American Red Cross What are the achievements? What is the thing to which we are attuned? What is the thing to which the American Red Cross member looks when he wants to tell somebody else what "my association" has done? Those things form the background on which we must build a sane program for the future For instance, the American Red Cross has placed in communities some 500 Red Cross nurses It has done in health education, for instance, a thing which is tremendous just for 1918 there were about 50 000 women graduated from the course in home care for the sick—home nursing About 16,900 in that one year were graduated from the class in dietetics There were 25,000 graduated from the first aid courses Now these are just bare figures indicating those women who were certificated from these classes and do not at all include the thousands of persons who were trained to do special pieces of work during great epidemics and disasters

In the past the American Red Cross has done two things in the health field

1 It has cooperated with our national health agencies, with our legally constituted local health authorities, with the United States Public Health Service, in doing different kinds of things in the health field, it has cooperated with these agencies in supporting financially, morally and with volunteer service movements which these agencies were promoting, picturing to its chapters the movement which another national organization was putting forward in such a way that the chapters took it up and added their influence and their energy and their work to the whole movement

2 It has always done health work in disasters it has done all kinds of work during the war, it fought typhus in Serbia, it fought tuberculosis in Italy, it fought infant mortality in France, it fought malnutrition in Belgium, and so you could go on All over war-stricken Europe, the American Red Cross did health things so there is behind the American Red Cross a tradition of doing health things It is, then, an organization of millions of persons attuned to service which has brought to them great satisfaction, and which in turn elicits enthusiasm, and it has a record of successful achievements in the field of health here and abroad

THE NURSE AND THE HEALTH CENTER

Now, with those two things in mind, that is, (1) the kind of organization it is, and (2) its record in the health field, the American Red Cross sat down to determine what specific things it should do in this country in the field of health I think is was wise for the American Red Cross to sit down and determine what the specific thing was that it should do I am glad it didn't jump into it all at once In considering national organizations from the standpoint, now, not of the physician or health worker but from the standpoint of sociologist or psychologist, there are some very important considerations which have to be brought into this discussion

First, no national organization (I am speaking now rather dogmatically, and there might be exceptions to this) has ever grown up on a basis of a broadly diversified program, that is to say, without pretty sharply defined aims, and objects capable of concrete expression A national organization which depends on lay membership for support must profess aims propose activities and produce results, which folks not you and I, but I mean lay-folks, can see

We believe that there must be definite projects which are to be held before those members for those members to see As definite a thing for instance as a Red Cross nurse in the field of health, projects that they can see and projects that answer the question 'What does your chapter do?" I Cross member thus accosted can reply Red Cross nurse, well that answers

Now, then, in the field of health the American Red Cross will set out to establish certain things One of those things is the Red Cross nurse, and another of those things is health education, which folks don't see so very well But a definite and powerful factor in health education which folks can see, which is coming now to mean something in the subconsciousness of all of us, is the health center, doing two things, harnessing the interest in health, which is dominant, and harnessing an interest in centering our efforts on some declared objective

The health center, then, is the one other activity which the American Red Cross wishes to idealize before its chapters so that when you or anybody else may say to a chapter, "What does your chapter do?" the chapter may answer, "We have a health center," and the question is answered

I want, in closing, to give this idea of what is forming in my mind as to the health center proposed by the American Red Cross

In the first stage, a health center has to do purely with striving for an education for people along health lines of telling them 'how" It must develop methods of enticing people inside its center and putting them in touch with the literature that is available all over the United States, adding the personal touch to the literature This first type may be undertaken by any chapter I am thinking in terms of my little town of about 300 population The next step adds a diagnostic clinic, next the operating clinic, and probably later adds hospital facilities for the whole county, becoming a unit taking care of the health and sickness of all dwellers in that county

This is the program of the American Red Cross

ABSTRACT OF DISCUSSION

DR J W SCHERESCHEWSKY Washington, D C I listened very attentively to the exposition of the program of the American Red Cross and I did not hear Dr Peterson say one word concerning in what way these activities are to be correlated with the activities of the properly constituted health authorities of the country We all agree that in an emergency all kinds of volunteer agencies and organizations are required to help in order that we may attain our goal quickly and decisively, but the problem of conserving the health of the people of the United States of building a health structure on broad and firm foundations is one that cannot be solved in a few months or a few years It means steady work carried on from day to day from week to week from month to month from year to year—even from decade to decade and from century to century This means that there must be a permanent properly maintained organization It also involves the exercise of police powers on the part of states and communities and the carrying out of health laws which can only be executed by the proper official agencies of the country Therefore it would follow that the program of the American Red Cross can only have two ends in view either that the American Red Cross ought to become the official health organization of the country or that the American Red Cross should be an auxiliary aid organization to the properly constituted health authorities of the country That ought to be the program of the American Red Cross, and then when that has been achieved they should retire from the field If the program of the American Red Cross is to receive the support of all health officers the American Red Cross must make some definite statement concerning its plans as to the way in which its efforts are to correlated with those of the health officers what purpose it has in mind to achieve and what goal it will endeavor to attain

DR PHILIP KING BROWN San Francisco I would like to know what it is proposed to do with the 2000 additional nurses the Red Cross desires, and how much supervision over the nursing program and public health the national headquarters of the American Red Cross will assume, and how much the local chapters will assume What is the present relationship that exists between the National Public Health Nurses' Association and the nurses of the American Red Cross? All over this country people are asking what the program of the American Red Cross is to be, and how the Red Cross proposes to correlate its efforts with those of the already existing organizations No one can know the wonderful work that the National Association for Public Health Nursing has done and not want to assist them in every way possible to enlarge in their field And when you ask for 2000 more nurses, it is natural that we should want to know what you expect to do with those nurses when we take into account the tremendous shortage that exists in the nursing field of the country today

DR JOHN D MCLEAN, Philadelphia In Pennsylvania there has already been established a very direct cooperation between the American Red Cross and the state department of health We have health centers in a number of places The local Red Cross agencies have cooperated with us in all things A number of times the words "health officer' have been used We in Pennsylvania do not like that term, "officer ' We do not want to be "officers" and we do not want to carry to the public what unfortunately that word has carried too often in the past, the idea and suggestion of police powers That is not, as we see it, our status Only in the very last extremity do we want to exercise in the full those powers which we have It is only in an extremity that we wish to use "police powers" The Red Cross nurses are working with us

DR JOHN P DAVIS New York I am merely a private practitioner Most of you are engaged in public health work I was very glad to hear Dr Peterson say that the private practitioner is a health asset in the community as well as the constituted health authorities The tendency has been, I think to drift away from the work and the influence of the private physician to that of the state or the public health officer Regarding the treatment of those people who are earning only $5 a week it was said that such persons were unable to go to the private practitioner because they could not pay and that therefore, it was the duty of various health organizations to take care of them I say that you should leave them where they have been in the past, to the average general medical practitioner The spirit of the average physician is to treat the man who comes to him, no matter what his wages may be Dr McLean has spoken about the power of the health officer Under the laws of the state of New York the health officer whether right or wrong is supreme In New York state a measure was introduced into the legislature providing that the testimony of a health officer in court could not be controverted, but would have to be accepted as a matter of record I am glad to say that this measure failed to pass and become law The arbitrary powers of the health departments are tremendous Dr McLean is right in his attitude concerning the word 'officer" One of the most unfortunate things connected with that service is the fact that they are termed 'officers", that they are considered, in a way as being policemen and that, therefore, it follows that many people have that terrible fear of health officers which is very unfortunate This should not be We should think of the health officers rather as helpers and advisers than as policemen In his speech of yesterday I heard the governor of Louisiana say that politics would not in any way enter into his program for the welfare of the lunatics, feebleminded, and all those suffering from mental troubles in the state of Louisiana This is the position taken by Governor Smith of New York on this question The spirit of preventive medicine is to be helpful rather than to sit in stern judgment Finally the object of all medical service is teaching, is helpfulness, telling people how to keep from getting sick, how to remain well

DR C W GODDARD, Austin Texas The title 'health officer' should be associated with the individual The use of the title can be held back and not emphasized But if you take from the individual the name "health officer" the laity will misinterpret this action, and it will be said, especially in

the rural districts, that the title has been taken from the health officer in general, and that will have a bad effect It will lessen in the minds of the laity, the authority of the health officer, and will limit his field of usefulness I believe the better plan, under all conditions, is not to emphasize that title of authority given to health officers With reference to the cooperation of the American Red Cross with the various state and local boards of health in Texas we have very satisfactory cooperative activities When we established the bureau of child hygiene we obtained the services of a woman who had been district director for the American Red Cross Nursing Department, and she retained this directorship for the state of Texas In this way we have a splendidly correlated work The nurses are nominated by this director of the bureau and we are placing them just as rapidly as we can We have in the past three months placed about thirty public health nurses in counties, and could today place more if they were available When these nurses are placed on duty they are given by the executive officer of the state board of health an appointment as sanitary inspector of the state board This is done quietly, without being emphasized to the people generally We issue to the nurses what we term standing orders, a set of rules which outline the sphere of activity of each of these nurses This set of rules is submitted to the local medical society for approval The nurse acts under the rules so agreed on Her relations to the medical profession are thereby outlined, and she knows what her sphere of activity is, and is governed accordingly We find this method a most agreeable one The nurses are furnished with blanks on which to make their reports of conditions of interest pertaining to public health If the nurse finds conditions in her community that are necessary to report to the state board of health, she makes her report in triplicate, sends a copy to the state board of health, one copy to the local officer and retains the third copy for herself This report is then taken up through the local health officer We are getting splendid results by that method of procedure in our section

DR E LUTHER STEVENS, St Augustine, Fla How can we take to our communities the basic ideas presented by the chairman and the program presented by Dr Peterson in his paper? How can we reach three distinct classes The business men, to get their support, the educators, those who are immediately connected with the school program, to get their cooperation, and the various organizations that are interested in welfare movements? What is the cooperative plan in connection with the charity organization idea? And what is the relation of this movement to the rapidly growing organization among the churches, the interchurch movement, which now seems to have so much of the attention of the people? The practical things which the American Red Cross organizations do, and which we have all had experience with, and have seen personally, are things that should be done in active cooperation, in thorough cooperation with all existing organizations Does the program alluded to provide for such cooperation?

DR ERVIN A PETERSON, Washington, D C The health service department of the American Red Cross has very definitely this ideal that eventually the legally constituted health authority will be the only health agency in a community I do not know how soon the American Red Cross and other private health agencies are going to work themselves out of jobs I am convinced, however, that when our democracy becomes a real democracy, that the health officer or the legally constituted health authority will be able to handle all the health problems of our country and of the different states and communities, but until that time I think he will not The health service department of the American Red Cross is definitely convinced that there surround the health officer certain very great weaknesses which are not inherent in the officer himself but have to do with social and political conditions There is a definite feeling on the part of many people that the health officer is a 'cop' and that it is as justifiable to 'beat' the cop there as it is to 'beat' him on his beat It seems to me that that has been one of the underlying reasons why great national organizations such as the National Tuberculosis Association the Cancer Commission the Child Hygiene Association the new Heart Disease Association, have arisen And those organizations have gotten tremendous support. Why? People are interested in something tangible You can see tuberculosis, you can see infant mortality You can see venereal disease On the other hand public health is big, folks cannot grasp it Therefore it is difficult to work up interest in it Many folks like to do things that officials do not do We like to assume the prerogatives of officials Until the time comes when the health officer is accepted by all as the leader in the health field, there will be a place for such organizations as those I have mentioned, and there will be much work for them to do There are many examples all over the country of health officers who have gotten far beyond and ahead of the position of being merely cops, and have taken the lead in health movements and are not only handling the situation from the standpoint of the law acting as an officer of the law, but are doing a tremendous work in health education That is the job of the public health officer of today The American Red Cross will endeavor in every way possible to help the health officer by means of nurses and health centers The American Red Cross is simply calling attention of the people to the need of wider knowledge of and wider activity in the field of public health and when that is done you will have less trouble in getting money for work in public health

There is a great demand for public health nurses The Red Cross could place 2000 on the pay rolls of its different chapters if nurses were available The Red Cross is proceeding in its nursing work with the idea that public health nursing is the function of health departments and as rapidly as such departments are ready to take over nurses hired by Red Cross chapters they are being turned over The Red Cross nursing department is cooperating with state health departments in employing supervising nurses who direct the work of the Red Cross nurses as well as those hired by the states The Red Cross is now giving its attention to ways and means of getting a larger number of women to enter training

Our studies have proved to us that there are large numbers of people in every community who do not go to the general practitioner either through poverty or ignorance or because of fear of the charge which will be made Therefore there is a considerable number of people in every community who ought to be taken care of And the answer is the clinic In organizing for the health center each chapter is advised and urged to secure as an advisory council representatives of all the operating agencies in the field of health The health officer a representative of the board of education the medical profession the dental profession and of all health association national state and local operating in the community The health center will do just what each of these agencies is very anxious to do namely educate the community in health and each agency ought to have many ideas to suggest We therefore hope to see on the advisory council which will be something different from a paper council the health officer of each community in which a health center is started

---

DEATH FROM APOTHESIN SPINAL ANESTHESIA

REPORT OF CASE*

W S DUBOFF M D
EDGEWATER COLO

As apothesin has largely replaced stovain and procain for spinal anesthesia and a study of the literature has revealed no instance of death from its use, it is desirable to place this case on record

REPORT OF CASE

A man aged 43 with an extensive bilateral fibroid tuberculosis and a subacute tuberculous laryngitis became a severe dysphagia especially for fluids entailing great diffi

* From the Sanatorium of the Jewish Consumptive Relief Society,

ing, was offered a gastrotomy operation, which he accepted On account of the profound cachexia and the unfavorable pulmonary condition it was thought advisable to use spinal anesthesia For the last year we have been using apothesin, following the technic described by Orth [1]

All instruments used were washed and boiled in distilled water Puncture was made in the second lumbar space with an ordinary Quincke needle Seven cubic centimeters of spinal fluid were withdrawn, the patient sitting up at the time, with the back arched Flow was at first slow, but became rapid in a few seconds The spinal fluid was added to a previously prepared solution of apothesin (one 1¼ grain tablet dissolved in 3 c c of distilled water and boiled for three minutes), thoroughly mixed and slowly injected The patient was then promptly placed on his back with the head slightly raised on a pillow The pulse was at this time between 80 and 90, regular and of good force and size At the end of one minute the patient was unable to raise either leg, but could feel pin pricks At the end of the second minute there were anesthesia to the iliac crests At the end of three minutes the surgeon was told he could proceed But before the patient could be draped, he suddenly became ashy, complained of a tightness in the chest, an inability to draw his breath, and announced that he was dying The pulse could not be felt at this time The respirations became very labored and ceased a few seconds later The pupils were equal and somewhat contracted till after death There had been no preliminary hypodermic of morphin

There seems to be little doubt that the anesthesia was directly responsible for this patient's death The very definite and rapid ascending paralysis, culminating in cardiac and respiratory failure, could be due only to diffusion of the drug into medullary centers It also seems to be clear that cardiac failure preceded a respiratory failure Disappearance of the pulse before failure of respiration was also noted by Yount [2] in a death due to stovain injected intraspinally

Reported deaths from spinal anesthesia bear a considerable similarity, regardless of the drug used

Orth [1] had no deaths in 700 cases, apothesin or procain having been used He insists that spinal anesthesia "when properly given, with apothesin or novocain is as safe as a local anesthesia with these drugs" Yount [2] reports 7,000 operations under spinal anesthesia with stovain, and only one death attributable to the anesthetic Boyd and Yount [3] record 6,229 cases with four deaths, only one of which was directly caused by the anesthetic—stovain Kahle [4] reported twenty-four successful spinal anesthesias with punctures as high as the eleventh dorsal space Stanley [5] had 280 cases without fatality from the use of tropacocain, while Weston [6] had 170 cases without untoward effects from stovain The death reported here occurred in a small series of twelve cases, five under stovain and seven under apothesin

OBSERVATIONS ON SOUTH AMERICA

V URUGUAY

WILLIAM J MAYO, M D
ROCHESTER, MINN

Uruguay, with one and one-half million inhabitants, has a great agricultural future In general, the people

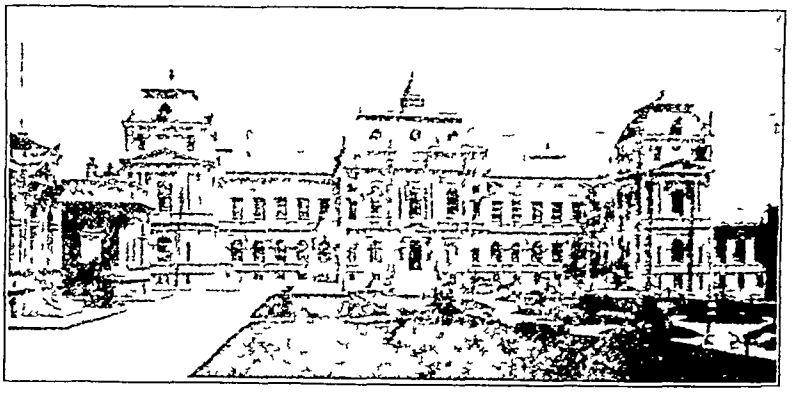

Fig 1 —Montevideo Medical School

are like the Argentinians The public administration is extraordinarily efficient Montevideo, the capital, has about 400,000 inhabitants It is a clean, attractive city, with streets well paved, even in the outskirts, and many fine parks, boulevards and suburban seaside resorts It is considered by many travelers the most beautiful and healthful residence city on the east coast of South America One of the boulevards, extending

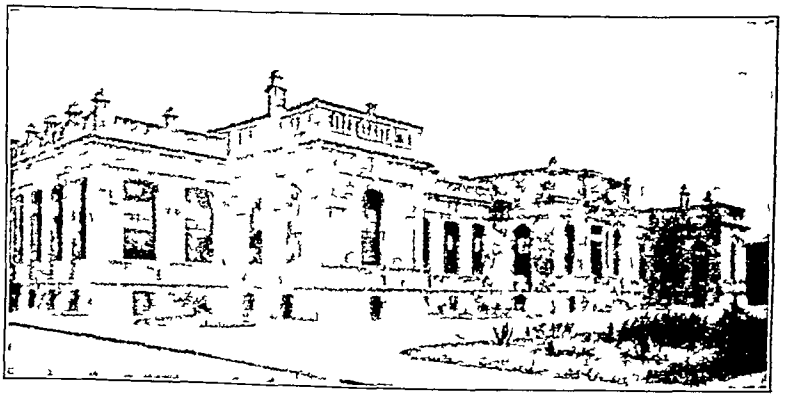

Fig 2 —Montevideo Chemical Laboratories

8 miles along the ocean, is named for President Wilson The city is 100 miles below Buenos Aires on the outlet of the La Plata River, which forms the southern boundary, the ocean forming the eastern boundary

The primary school course in Uruguay is five years and the secondary course six years The medical school, a part of the University of Uruguay, is a large, ornate and dignified building (Fig 1) Six hundred students are enrolled, and the graduating classes number from sixty to seventy The course in

medicine is seven years The medical school has a fine library The laboratory facilities and equipment are excellent (Fig 2), and there is ample material for dissection Postmortems are permitted on all patients dying in the hospitals

The hospitals in Montevideo are modern and equal to any in South America The older hospitals are built in the Spanish pavilion style, usually one story, with gardens between the pavilions The new hospitals are several stories high (Fig 3) Here, as elsewhere in South America, there are few trained nurses and an absence of screens I was told that when screens were placed no one respected their use, and, indeed, in the few instances screens were seen they were carefully propped open With the exception of the hospitals maintained by the colonies from various countries, those in Uruguay are supported by the government Accommodations are provided for pay patients, and the price of rooms in the private pavilions ranges from $3 to $6 a day One beautiful hospital (for women) is under the direction of Dr Pou Orfila, a noted surgeon The Italians have a very beautiful hospital with many interesting features (Fig 4) To prevent flies from entering the operating rooms, persons pass from the main corridor through a small antiroom which has blue glass ceiling, sides and door It has been demonstrated that flies will not pass through this blue-lighted space

The chief surgeon of the British Hospital, Dr Garcia Lagos, professor of surgery in the government

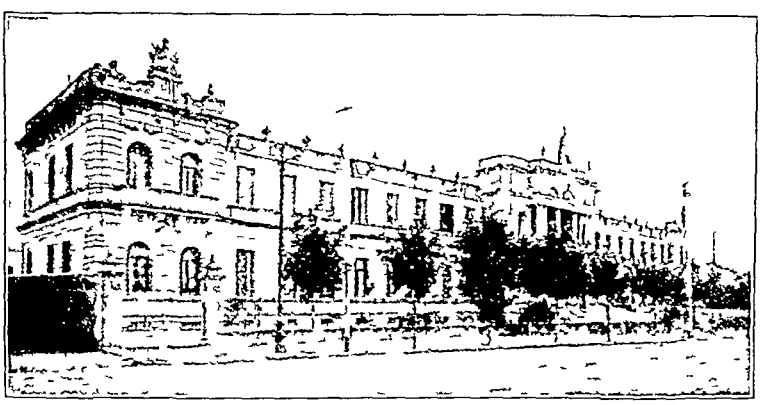

Fig 3 —Hospital Montevideo

medical school, is particularly interested in surgery of the stomach He has developed a method of dealing with gastrojejunal ulcers and hemorrhages from the gastro-enterostomy opening by making an incision in the anterior wall of the stomach, drawing the gastro-enterostomy completely through, and then proceeding according to the necessity of the case I have employed this method twice in emergency, such as hemorrhage immediately after gastro-enterostomy, but have never used it in the manner described by Dr Garcia Lagos for a direct attack on chronic conditions involving the stoma It would appear to have merit in suitable cases Dr E Pouey, the leading gynecologist of Uruguay has a fine hospital for women, just completed by the university Dr A Navarro, another prominent surgeon of South America, has splendid hospital facilities and surgical material

Gambling is a legitimate pastime, or vice, throughout

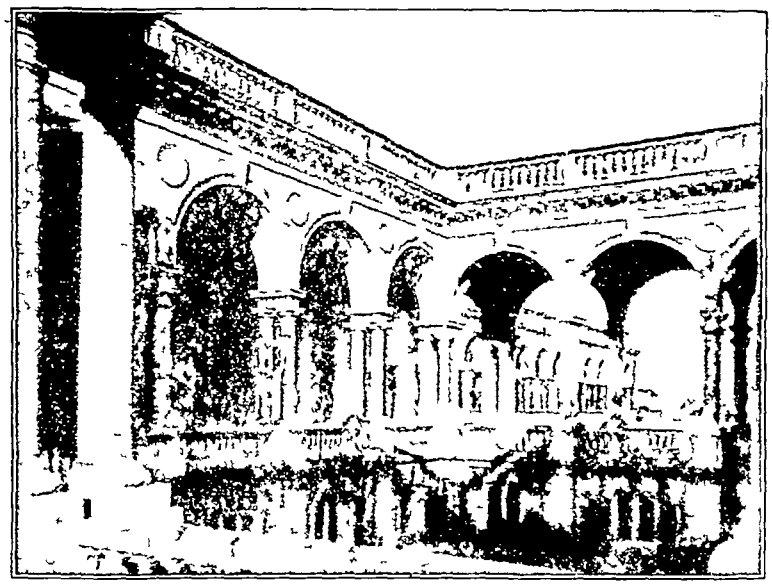

Fig 4 —Italian Hospital Montevideo

South America, and Uruguay is no exception The government supports beautiful hotels, seaside pavilions, hospitals and other charities from the proceeds of the roulette wheels Montevideo is the Monte Carlo of South America

During the Great War, Uruguay stood staunchly with the United States, and her president, Señor Baltasar Brum, a brilliant young statesman who is well known in diplomatic circles in Washington, and the able foreign minister made decisions which will be permanent additions to international law in substance, first, that a republic fighting for her sovereign rights is not a belligerent and has the right of asylum and protection from all republics, and second, that when the United States is forced into war to protect her rights she is protecting the rights of all republics, and all republics become parties to the conflict Uruguay promptly followed the United States in declaring war on the Central Powers

The Ideal Health Department —An ideal health department in a nation such as ours demands a partnership of federal state and local health departments in order to secure team work of all agencies from the federal government to the ultimate unit of health work—the individual citizen This partnership should be so clearly defined so universally understood and so conscientiously utilized that all fields of public health work will be covered with the minimum of overlapping and friction —A J McLaughlin *Comm on Health* ember December 1919

THE CONDITIONS IN THE BRAIN DURING STAMMERING

In attempting to ascertain the various factors, psychologic and physiologic that enter into the involuntary stops in uttering syllables or words, which constitute the phenomenon known as stammering, several studies of the circulatory changes accompanying it have been made These agree in suggesting that stammering and shock, such as result from surprise, fright or comparable manifestations are induced emotional disturbances accompanied by vasomotor changes Observations on the peripheral blood vessels have been made by various plethysmographic methods with the resulting demonstration that there is almost invariably a marked vasoconstriction According to the investigations of Robbins [1] in the psychologic laboratory at Harvard University, unusually intense shock (such as the unexpected report of a pistol) is accompanied by greater vasomotor changes in the periphery than is stammering Severe stammering, on the other hand, is accompanied in most subjects by greater vasoconstriction in the finger than is shock produced by any stimulus but the pistol The time of recovery is about the same for stammerers as a class both in stammering and in shock, but is greater for most individuals in stammering than it is in shock produced by stimuli other than the pistol In stammerers, peripheral vasoconstriction continues throughout the stammering interval, whereas, if any vasomotor change accompanies normal speech, it is vasodilatation as a rule

Physiologic investigations on trephined but otherwise normal persons have made it possible to study the vasomotor changes that occur simultaneously at the periphery and in the brain Observations made under these conditions have demonstrated that a sudden shock is always accompanied by vasoconstriction in the periphery and by vasodilatation in the cerebral tissue As Robbins had likewise noted a peripheral vasoconstriction during stammering he made the inference, in 1919, that stammering, like shock, is accompanied by vasodilatation in the brain and hence by cerebral congestion He pointed out that the latter condition affects speech more easily than it alters any other human activity Robbins learned from normal persons whose introspection was reliable that the words they were about to speak suddenly left their minds when the whistle blew, and did not return for several seconds Some of them still visualized the words, and their minds seemed otherwise to work normally, yet the sounds of the words left them and hence they were unable to say the words When vasoconstriction in their fingers ceased, the sound of the words returned and they were able to speak them The same phenomenon occurs in stammering According to Robbins, the fear of stammering and the excessive effort put forth in forcing out difficult words cause cerebral congestion, which induces the auditory images of the words the stammerer is about to speak to disappear as he attempts to utter them, just as the whistle banished the sound of the word the normal speaker wished to use and made of him a temporary stammerer

The theory of cerebral congestion defended by Bluemel [2] in 1913 was, after all an indirect inference Actual measurements of the circulatory changes in the brains of stammerers had never been made Although there are thousands of stammers in the United States it might have seemed unlikely that one could be found whose skull had been trephined Yet when a request for possible information regarding such a hypothetic person was published in THE JOURNAL [3] last year, a suitable individual was promptly discovered

As a result of this fortunate circumstance, Robbins [4] has been enabled to furnish the missing evidence regarding the actual condition of the brain during stammering The patient had sustained a bullet wound of the right frontal region without evidence of any brain injury Evidently the bullet was removed and a small trephine hole left open Through the skin loosely covering this, pulsations of the brain mass were often conspicuous and a glass plethysmograph was readily applied to record the volume changes in what is, so far as we are aware, a unique case for study in medical literature The observations show that pronounced shock, fear of stammering and emotions of every kind always brought about increase in brain volume accompanied by increased size of pulse Stammering was accompanied by much more marked increase in brain volume than could be accounted for by either the physical or the mental work used in normal speech When the stammerer read as normal speakers do, there was a return of the brain volume to normal, it is reasonable to conclude that increase in brain volume is an important factor in the production of stammering

The theory of Bluemel that stammering is caused by transient auditory amnesia in the auditory speech cen-

ter brought on by cerebral congestions has at length found substantiation in the results of direct observation on man Evidently the fear of stammering and the forcing out of hard words which accompanies stammering cause vasoconstriction in the periphery and cerebral congestion As Robbins expresses the situation, the congestion blurs verbal imagery, especially auditory verbal imagery, and makes it impossible for the stammerer for the time being to recall a part or the whole of the word he wishes to speak at the moment he has to say it In order to correct stammering, both the fear of stammering and the abnormal muscular contractions which usually accompany stammering must be eliminated

THE MEANING OF REST TO PATIENTS

One of the fundamental dicta with regard to metabolism is that it increases with work or muscular effort How large, comparatively, the increment may be is less well appreciated The answer to the question has an important bearing on the food requirements of the working person there is also a significant relationship of effort to energy expenditure in the case of the sick who need to conserve or gain The doctrine of rest, either complete or limited, is one that the physician finds desirable to inculcate often What is gained thereby in the mere conservation of food fuel or body tissues can be well understood by a consideration of what exertion really entails The expenditure of energy in the body is affected by a number of factors, which include age, size, sex and occupation The loss of energy per unit of accomplishment is greater in those cases in which the worker is untrained and the muscles are unpracticed for their tasks Fatigue also causes inefficient performance

The activities of a recuperating or resting patient are comparable in some degree with the lightest types of housework What this may mean in terms of energy has recently been described by Langworthy and Barott[1] of the Office of Home Economics, U S Department of Agriculture Light tasks, such as sewing, chroheting or embroidering, call for an average expenditure of about 9 calories an hour more than that of the same person sitting quietly in a chair Tasks regarded as "harder work" than sewing, such as washing, sweeping or scrubbing, require an increment of at least 50 calories an hour

The government experiments have shown how the mere change in the height of the table at which work is being done may cause an increase of from 20 to 40 per cent in the calories required This illustrates, to quote the report, the importance of choosing equipment to "fit" the worker If the lesson is applied to the sick room, however, it serves as a patent reminder of what is too often overlooked by both the patient and attendants namely, that it requires only a seemingly small degree of discomfort or added effort to waste a relatively large fraction of available "strength" and energy Conversely, complete rest represents the possibility of real conservation if the food intake and the metabolic capacity are not impaired Even easy work—indeed sometimes mere sitting up or the operation of dressing—means a real cost to the body which it may be well to save in times of nutritive stress, when economy of energy is an immense gain to the patient

THE CARE OF CARDIAC PATIENTS

Patients with cardiac disease present one of the most difficult therapeutic problems confronting the medical practitioner More attention seems to have been bestowed on diagnosis than on any phase of cardiac disease indeed treatment has been well summed up under the simple terms rest digitalis and general hygiene The outlook for the future of such patients has therefore not been particularly encouraging However one of the few benefits of the great war was the directing of the attention of physicians and educators toward reconstruction of persons disabled and handicapped and certainly the patient with a weak heart is as crippled as the one who has lost a limb An indication of this interest appears in a recent issue of the *Hospital Social Service Quarterly*, which contains two contributions on the care of cardiac patients

St Lawrence and Adams[1] report in detail the efforts being made for cardiac children Diagnosis once made, the first step is the elimination of such factors as focal infection and undue physical stress, which may hasten the gradual decline that has been an invariable feature of the lives of such children Classes are formed in which regular examinations are made and thus unfavorable complications prevented Rheumatic manifestations, chorea and focal abscesses are sought for The capacity of these patients for work is determined, and the patients are divided into groups of first, second and third degree, indicating the amount of work that the patient may undertake First degree patients have a normal exercise tolerance, second degree patients have a lessened tolerance and third degree patients are referred to a hospital ward The graduated exercises include calisthenics, climbing of stairs, and the ordinary forms of games and sports

Arrangements have been made through the organization for sending children to the country following severe operations prolonged ward residence or failure of improvement The patients are followed into their homes, and arrangements are made for vocational training and education According to the authors, the results obtained have been excellent Whereas formerly work with cardiac patients was discouraging and uninteresting under this systematic method of control the future seems promising

1 St Lawrence W P and Adams F Louise The Organization of Cardiac Children Hosp Social Service Quart 2 1 (May) 1

A further effort toward the care of persons handicapped by cardiac disease is outlined by the director[2] of the employment bureau for the handicapped, which is maintained by the Hospital Social Service Association of New York City. One of the greatest difficulties to be overcome in the care of chronically diseased or permanently disabled persons is the establishment of a hopeful outlook for their independence. Such patients more than anything else fear poverty and dependence. Therefore the successful establishment of an organization which will find for them occupations suitable to their condition is a step forward.

From June, 1919, to February, 1920, 305 patients with cardiac disease were referred to the bureau. Of these, 161 were placed in good occupations, of whom 117 were still in their original positions. In finding employment for cardiac workers, it is necessary to remember that such patients cannot do heavy lifting, cannot climb stairs, and cannot operate any but small hand-machines. They are, however, quite well suited for light sedentary work, such as may be found in fountain pen factories, the jewelry industry, piano factories and the tobacco industry. Women are referred to positions in carding jewelry and in sewing and mending laces. Others are placed in hotels where light work has been found for them. One of the chief difficulties of the bureau has been to assure employers that such employees would not "drop dead" at work. The records indicate that there have been no sudden deaths and no accidents among these persons placed by the bureau, and that no workmen's compensation has had to be paid to any of the persons employed. The results are good evidence of what may be accomplished through careful study of individual tolerance and selection of occupation to suit the physical condition. The cooperation of the physician in such social service is fundamentally necessary, and he should be prepared to take an active part in the work.

DANGERS OF PLASMA DEPLETION

In clinical practice as well as in the experimental laboratory, occasions frequently arise when it becomes highly desirable to secure some acceptable substitute for blood. The recognition of this need in the case of surgical or traumatic shock, in particular, has led to a prolonged search for the "ideal" substitute. As has been pointed out at various times in THE JOURNAL, few if any of the proposed fluids for introduction into the circulation meet the essential requirements. Some, like physiologic sodium chlorid solution, disappear so rapidly that their influence in maintaining the desired effectiveness of the circulation is speedly lost. So far as the restoration of a depleted blood volume with consequent maintenance of an adequate blood pressure is concerned, the use of fluids containing colloids, such as gum acacia, has lately found some favor. Owing to the osmotic pressure of the colloid gum, which cannot readily escape from the blood vessels, fluid which would otherwise disappear is retained within the blood vessels.[1] But even this solution is no panacea. Evidently there are numerous conditions under which poisonous products may arise in the body in direct or indirect relation to circulatory failure. These factors making for harm are as yet only imperfectly understood.[2]

A further possible agency in the failure of the various "substitutes" for blood has been brought into notice by the experimental studies of Whipple[3] and his collaborators at the Hooper Foundation for Medical Research, University of California. After withdrawal of large amounts of blood by hemorrhage, they have attempted to replace the loss with various fluids in all of which red corpuscles of the same species were returned to the circulation. If the fluid returned is protein-free, one may speak in such cases of plasma depletion or plasmapheresis to indicate a loss of plasma protein by means of hemorrhage followed by the replacement of like amounts of red corpuscles. When this process of depletion is carried out to a considerable extent, complete restoration of the lost serum proteins is only slowly accomplished. According to the latest findings, when the depletion of the total serum proteins is carried below 1 per cent., fatal reactions are likely to ensue. This is not due to mechanical factors, such as the removal or return of fluids to the circulation, for when a mixture of red blood cells and serum instead of saline solution is returned to the blood stream, the ill results do not follow similarly.

The symptoms observed in animals deprived of undue amounts of serum proteins represent the clinical picture of "shock." Whipple believes that the serum proteins represent an essential part of the "environmental complex of the body cells." The blood serum proteins are looked on as "stabilizing or protective factors," and their alleged role in the interrelations of blood to tissues is regarded as the most important function of these plasma colloids. At present they are not believed to be concerned primarily with the nutrition of the body, although this was long assumed to be the foremost use of the serum proteins.

As yet the etiology of the condition of shock observed in the plasma depletion just defined remains obscured in hypothesis. The California investigators

H.: Factors Concerned in the Perfusion of Living Organs and Tissues, ibid., p. 101. Kerr, W. J., Hurwitz, S. H., and Whipple, G. H., ibid. 47: 356, 370, 379 (Dec.) 1918.

believe that certain body cells, notably those of the liver, are decidedly sensitive to changes in the content of circulating serum protein The essential injury under these circumstances is, they assert, cell protoplasm injury induced by a sudden change in the colloidal solution which forms the normal environment of these cells This, they add, may be a new type of cell injury, but it may help us to understand the more complex cell injury which is probably responsible for "surgical shock" It is suggested that the suspension of tissues in saline solutions prior to transplantation, and likewise the perfusion of organs with such protein-free mediums may be detrimental to the purpose to which they are to be put These solutions may be objectionable because of what they lack rather than because they contain positively toxic ingredients Perhaps far more consideration will necessarily be given in the future to the harmfulness of diluted blood plasma, if slight modifications of it can actually produce such profound effects on the body cells

Current Comment

DECLARING THE ALCOHOL PERCENTAGE

And now comes the *American Druggist* and suggests that the National Food and Drug Act be amended so as to delete the requirement of statement of alcoholic content on the labels of drug products According to this representative of pharmacy, to require longer a declaration of the alcohol content on medicines would be inimical to the public welfare as the statement 'is an incentive to the uninformed and depraved to resort to the use of drug preparations containing alcohol, as a necessary constituent, for intoxicating purposes" If our memory serves us there were at least a few people who "resorted to the use of" Peruna and similar nostrums for "intoxicating purposes" long before the Food and Drugs Act required these products to declare their alcohol percentage According to this same authority, alcohol in medicinal preparations "is used at present, almost exclusively, for solvent preservative and extraction purposes, and not for therapeutic purposes" Was there ever a proprietary remedy in which the alcohol—ranging from 10 to 47 per cent—was *admittedly* a therapeutic ingredient? Another argument advanced is that processes of manufacture are trade secrets and should not be required to be divulged and as the "vehicle of a drug preparation is a part of the process of manufacture, and since the vehicle is frequently alcoholic [We'll say it is!—Ed] a statement of alcoholic content often deprives the manufacturer of one of his legitimate means of competition" But the crowning argument of all made by our esteemed contemporary is that 'the deletion of the now unnecessary alcohol statement would permit the inclusion of more important information on the label' Yes indeed! The words *"CONTAINS 25 PER CENT ALCOHOL"* take up so much valuable room, space doubtless that the manufacturer of proprietary remedies would prefer to use in giving the public information regarding some of the other ingredients of his nostrum that the federal law does not require to be declared on the label With the appropriations for the Bureau of Chemistry cut down to a point where it will be rendered impotent to proceed against fakes in medicine, and with the drug trade apparently about to insist that the teeth of the Food and Drugs Act shall be drawn, the nostrum interests must be looking forward to prosperous times

RENAUDOT AND THE FIRST FRENCH NEWSPAPER AND MEDICAL JOURNAL

The first French newspaper was founded in 1631 by Theophraste Renaudot a physician and great humanitarian Renaudot was graduated from the medical school at Montpellier in 1606 before he had reached his twentieth year He had inherited a considerable *fortune from his parents* "Recognizing the fact that a physician should be of a certain age before he can reasonably expect to command the confidence of his fellow men" Buck[1] says, "he decided to utilize the time following his graduation in visiting some of the more important capitals of Europe" Renaudot visited Italy Holland Belgium, Oxford and Cambridge and on his return to France took up the study of chemistry During his life in Paris he became aware of the terrible condition of the poor and looked about for some method of improving their condition but, all his efforts unavailing, he returned to his birthplace in Loudon While there he met an influential Capuchin monk who brought him to the notice of the great Cardinal Richelieu Regardless of the fact that Renaudot was of the Protestant faith he was able by his honesty and good presence to secure the strong support of the great cardinal, and shortly returned to Paris He now founded a central employment bureau for the employment of poor persons, where on payment of three sous any person might be registered and where employers might arrange to meet prospective employees, no charge being made in the case of a poor person As a further step, Renaudot ultimately organized a loan office with the motto, "Lend money without expectation of profit' the taxes on loans being fixed at 3 per cent His solution of the social problem was summed up in the aphorism In every organized community or state the rich shall afford aid to the poor all harmony between the two classes ceasing when one of them grows richer at the expense of the other" In the search for the source of socialism, this aphorism has perhaps been overlooked It is particularly interesting to read how the newspaper came to be founded It was issued first as an official sheet containing news received from the outside world, the king's edicts and treaties made with other nations Realizing how valuable such a paper might be for personal interests Richelieu strongly supported it and Louis XIII finally granted to Renaudot "the privilege to make print and sell through any agent whom he might select and wherever it seemed to him best to sell copies the news

1 Buck A H The Dawn of Modern [illegible] New Haven Yale University Press 1920

the official appointments and accounts of all events occurring both within and outside the kingdom" This paper, known as the *Gazette de France,* was first published in four pages to sell for half a sou One year later it was increased by four pages under the title *Nouvelles,* and the price increased to one sou It is reported to have been a brilliant success from the first day of its publication in 1640 After nine years, Renaudot changed its scope by adding to it the character of a medical journal, thus began the first French medical journal He continued to edit it as a medical journal until 1653 In 1640, he was permitted by the king to establish a bureau for the free treatment of the sick poor This was so well organized as to compare favorably with our modern free dispensaries In fact, this dispensary soon attracted many physicians and began to take on the character of a school for clinical instruction, at that time an entirely new feature In sketching the life of this French physician, Professor Buck has done a real service to the history of medicine It is rare that executive ability, humanitarian ideals and enterprising originality of the character which Renaudot displayed are combined with a scientific mind When the combination does occur the world profits

THE LIVER ESSENTIAL TO PROTEIN METABOLISM

The importance of the liver in the metabolism of protein in the body has been strikingly upheld by recent observations at the Hospital of the Rockefeller Institute for Medical Research in New York As there is convincing evidence that urea, the conspicuous end-product of nitrogenous metabolism, can be formed in tissues other than the liver, some doubt has arisen as to whether the hepatic function is, after all, as paramount in relation to the reactions ending in urea production as has been supposed There is reason to believe that amino-acids are the foremost representatives of disintegrating protein in the body The catabolism of protein therefore means primarily the breaking down of amino-acids It is accordingly conceivable that when this chemical disintegration is interfered with, free amino-acids will accumulate in the tissues and fluids, notably in the blood It does happen, in fact, that the blood sometimes is richer than normal in amino-acids Almost invariably, however, when this occurs other nitrogenous excretory substances, such as creatinin, uric acid and even urea, also accumulate in the blood, thereby indicating that it is an impaired and inadequate renal function rather than any insufficient metabolic activity which accounts for the undue amount of amino-acids detected at the moment In acute yellow atrophy of the liver, an extremely rapid autolysis of the tissue liberates amino-acids in enormous proportions According to analyses of Stadie and Van Slyke,[1] they may then appear in the blood to a degree unequaled in any other known condition The urea content of the blood is not thus enhanced, indicating that somehow the amino-acids are not being deaminated and converted into urea as readily and rapidly as they ought to be The amino-acids circulate and are excreted as such in unusual amounts The important fact is not merely the formation of amino-acids on a large scale This happens in other conditions of autolysis, for example, during resolution in pneumonia Urea is nevertheless formed readily, and amino-acids do not remain unconverted Tissue waste results in definitely increased excretion of amino-acids only when the destruction of the liver cells is almost complete, as in yellow atrophy In this disease, organ systems other than the liver are not prominently involved, if one may judge from histologic evidence Hence, as Stadie and Van Slyke observe, their analyses support the view that in the deamination of amino-acids and synthesis of urea the liver bears a part that cannot be entirely assumed by the rest of the body

1 Stadie W C and Van Slyke D D The Effect of Acute Yellow Atrophy on Metabolism and on the Composition of the Liver Arch Int Med 25 693 (June) 1920

DIETARY JUSTICE TO THE PEANUT

The statistics of the peanut crop in the United States attest the growing popularity of the product For many years peanuts were eaten essentially as "extra" foods, like candy and other sweetmeats Latterly, they have begun to claim a more substantial place in the diet Under the appealing designation of peanut "butter," the ground peanuts are finding widespread use as a palatable, wholesome food Peanut oil is now expressed in large quantities from shelled peanuts, and has received commendation From the resulting press cake, peanut flour has been prepared by grinding Peanuts are unusual in containing a considerable proportion of protein along with both fat and carbohydrate Water-soluble vitamin is also not lacking Experts in the Office of Home Economics at the U S Department of Agriculture [1] have shown that the nutrients of peanuts are easily digested by man Johns and Finks [2] of the same department have given an added worth to the food by demonstrating convincingly the high physiologic value of the peanut protein Various investigators have demonstrated that bread made from wheat flour of current composition is inadequate as the only source of protein in the diet The government workers have found, however, that bread made with a mixture of 25 parts of peanut flour and 75 parts of wheat flour furnished adequate proteins for normal growth of experimental animals The proteins of the peanut bread were utilized for gain almost twice as well as those contained in wheat bread This does not mean that the familiar "staff of life" should be abandoned or regularly diluted with peanut flour, it does, however, put a stamp of real nutritive merit on a food product that many a physician still thinks of solely in terms of a trouble maker for digestion

Protection of Health and Life—As in the beginning, so now, and throughout all time the first business of government will be the protection of human health and life, and the government that discharges this, its first duty, will guarantee its own greatness and permanency through the development of a vigorous and happy citizenship—W S Rankin, *Tr Assn Life Ins Presidents* 1919

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION PUBLIC HEALTH ETC)

GEORGIA

Division Changes Name—The title of the Division of Rural Sanitation of the Georgia State Board of Health has been changed to that of Division of County Health Work

Full-Time Health Officers—On July 26 it was announced by the state department of health that twenty-five counties of the state have established county boards of health with full-time health officers in accordance with the provisions of the Ellis law The latest to establish county boards of health were Hall, Telfair, Jasper and Brooks counties

Health Centers Established—Health centers have been established at the Grady Hospital Clinic and at the Woman's Club Atlanta One is soon to be established in the Moreland Avenue School district and others will be opened later in other sections of the city all under the direction of the child welfare department of the state board of health, of which Dr Lydia A de Vilbiss is head

ILLINOIS

Personal—Dr John H Fulgham East St Louis has resigned as clinician for the East St Louis Tuberculosis Society——Dr Ora J Cubertson East St Louis, suffered burns on the face hands and arms from the explosion of a can of gasoline, August 3

Funds Sought for New Hospital—The Chicago Polyclinic after thirty-four years of service is preparing to launch a drive to collect funds for the purpose of erecting a hospital building The plan is to put up this building on land joining the present Henrotin Hospital and it is hoped to establish a modern hospital center in which all the health activities of that district will be housed

MARYLAND

New Standard for Ice Cream—Under a legislative act which went into effect June 1 ice cream is defined as a frozen product of cream and other milk substances containing not less than 8 per cent of butter fat Not exceeding 1 per cent of pure gelatin tragacanth or vegetable gum may be added

Last Health Lecture of Summer Series—The last public lecture of the summer series at the Johns Hopkins University was given on the closing day of the summer school by the director of the school of hygiene and public health Dr E V McCollum on "Nutrition as a Factor in Preventive Medicine" It was followed by a reception to all the students of the summer school at the civil engineering building

Investigation by Health Department—An investigation to determine the cause of an unusually large amount of dysentery in Baltimore this summer is under way at the health department Fifteen to twenty new cases have been reported in the last two days and the cooperation of physicians of the city has been asked to determine the exact type of the disease The death rate among babies under 2 years of age is suddenly increasing and nurses are looking into the cause Until last week the mortality among infants dropped as compared with 1919 Fifty infants died last week, twenty more than the same week a year ago

Personal—Dr John Jacob Abel professor of pharmacology at the Johns Hopkins University has been honored with the degree of Doctor of Laws by Cambridge University England Dr Abel is editor of the *Journal of Pharmacology and Experimental Therapeutics* and a member of the National Academy of Sciences——Dr Harry J Moss superintendent of the Hebrew Hospital Baltimore will sever his connection with that hospital in September to become superintendent of the Brownsville and East New York Hospital Brooklyn——Dr Howard A Kelly Baltimore who is spending the summer months at Indian Point on Ahmic Lake Ont. fell and broke his leg recently while alone in the Canadian woods——Dr D L Gifford Zion Cecil County who has been ill in a Philadelphia hospital for several months has returned to his home greatly improved in health——Dr Martin L Jarrett Jarrettsville is a patient at St Joseph's Hospital

Drive to Aid University Hospital.—Preparations for a statewide drive to raise funds for the university hospital were recently made at a meeting of the executive committee in charge of the campaign The drive will last eleven days beginning October 2 and ending at midnight October 12 The amount of money to be raised by the drive has not yet been determined but it is thought that it will exceed $500 000 This drive is one of the first undertakings attempted by the board of regents of the University of Maryland since the recent consolidation of the professional schools of the University of Maryland and the Maryland State College into a state university The vital problem of supplying the different hospitals in the city with nurses and homes for nurses was discussed as well as the need for more room for maternity cases in the hospitals It was decided that what was most needed by the university hospital and the city were a nurses' home and a maternity hospital There is a working agreement between the university hospital and the Johns Hopkins Hospital for the Broadway institution to take care of as many of the maternity cases east of the Fallsway as it can But it was pointed out that the hospitals in Baltimore can no longer handle all of these cases with their present facilities and a new maternity hospital is imperative The committee will also attempt to raise sufficient funds to enlarge the present accident service which now maintains a twenty-four hour service

MASSACHUSETTS

Rockefeller Foundation Appropriation—The Medical School of Harvard University has received $350 000 from the Rockefeller Foundation for the development of psychiatry and $300 000 for the development of the teaching of obstetric

Personal—Dr S Burt Wolbach of the Medical School of Harvard University who has been working abroad for six months in an effort to establish definitely the organism causing typhus fever has returned to the United States ——Cambridge University has conferred the degree of Doctor of Laws on Dr Harvey Cushing professor of surgery in the Medical School of Harvard University

Lepers to Be Returned for Further Treatment—The two lepers at the State Colony on Penninkese Island whose condition had shown such marked improvement that their provisional release was being considered are to be returned from Boston to the island Newspapers had reported them as cured and had stated that a new remedy for leprosy had been discovered The commission of physicians appointed by the state board of health reports as follows No open lesions in the throat or elsewhere were found on either both showed small nodules in the throat and soft palate presumably leprous with no tendency to ulceration scars were present in the nose and throat of both one had a nodule on the septum which which had healed one had a perforated septum was excised for examination (no report yet), both showed still some palpable enlargement of the ulnar nerves both showed no definite loss of sensation even over scarred areas both showed some possible diminution in the power of sensation on the forehead both gave positive Wassermann reactions both gave repeatedly abundant lepra bacilli on scarification of the mucous membrane of the septum of the nose and the lepra bacilli were not only abundant but were found in their characteristic roseate form of clustering the swab cultures from the nose without scarification were negative The board concluded to return them to the colony for further treatment Treatment had been by chaulmoogra oil as used in the Philippines that is given by mouth to the limit of tolerance and also administered in what is known as the C C R combination hypodermically——chaulmoogra oil camphor and resorcin Dr Frank H Parker is medical superintendent of the hospital

MINNESOTA

Personal—Dr Edward W Buckley St Paul has been made a Chevalier of the Legion of Honor on account of services rendered in France as an official of the Knights of Columbus

MISSISSIPPI

Sanitary Engineer Appointed—The state board of health has appointed Mr H A Kroeze as sanitary engineer Mr Kroeze has been assistant sanitary engineer for the Mississippi State Department of Health

Site for Home for Feebleminded [illegible] that he had of Ellisville for the [illegible] announced [illegible]

minded has been accepted The offer of Ellisville included $20 000 in cash and 2,570 acres of improved land with forty residences, worth at least $200,000

Health Teaching by Moving Pictures—Mr E G Pope, the director of health work in Granada County, has begun a series of lectures illustrated by moving pictures to further hygiene and sanitation He has two assistants, one of whom is a representative of the American Red Cross

Foreign Letters

PARIS

(From Our Regular Correspondent)

Aug 6, 1920

Public Hygiene and the League of Nations

The Council of the League of Nations recently discussed the report of M da Cunha, delegate from Brazil, on the formation of an international organization of hygiene as provided by the treaty of Versailles The purpose of this organization is principally to advise the League of Nations in matters of hygiene, to communicate promptly recommendations designed to combat epidemics and diseases in general, to conclude international agreements bearing on hygiene and to revise existing treaties, to protect the workingman and to cooperate in this endeavor with the international labor organization and the Red Cross, and to organize medical missions on the demand of the League of Nations This constitutes, in fact an amplification of the first Office international de l'hygiene publique, which was created by a conference held in Rome in 1907 and an adaptation of the latter organization to the League of Nations

The new organization will be formed (1) of a general committee of survey composed of the delegates of all the states which adhered to the Rome conference in 1907, (2) of a permanent committee consisting only of delegates of countries represented in the Council of the League of Nations, and (3) of a secretarial office The permanent committee will consider all projects which will be submitted to the approval of the general committee, and the latter will transmit the proposals to the respective governments who will have final decision in all matters The expenses of this new organization will be borne by the general budget of the League of Nations

The Dangers of Table Salt

Professor Rappin director of the Pasteur Institute of Nantes, recently read an interesting paper on the subject of The Dangers of Table Salt, at a meeting of the Association française pour l'avancement des sciences, just held at Strasbourg Table salt can become the starting point of dangerous changes and fermentative processes, not only in industrial food establishments but even in the kitchen itself Salt does not inhibit the vitality of micro-organisms for the destruction of which it has been commonly used. Collected in a careless way without special precautions from mines and salt marshes, salt contains a great number of micro organisms capable of jeopardizing the keeping qualities of foods to which it is added for the purpose of preservation Experiments show that the anthrax bacillus resists the action of a saturated solution of salt for two days, the erysipelas bacillus and streptococcus survive after twenty days' immersion the typhoid bacillus and the staphylococcus resist for five months, the diphtheria bacillus remains active after three weeks, and the tuberculosis bacillus even after three months Only the colon bacillus and cholera vibrio seem to be more vulnerable

Even after cleansing in the ordinary processes of refining, salt contains quite a number of micro-organisms Rappin

has found, for instance in a gram of salt from 1,300 to 38,000 bacteria and from 100 to 400 fungi These figures are considerably greater if the examination is made on dirty or crude salt, and such salt was found to contain between 6,000 and 51,000 bacteria per gram and, in several instances, between 76,000 and 300 000, with the content of fungi varying between 150 and 700 Brines, prepared for pickling contain even more micro-organisms In a sample of pork brine prepared two months before, the number of colonies on the eighth day reached a total of 960,612 per cubic centimeter Professor Rappin thinks there is no doubt that when food industries use such dirty salt for example, for butter and cheese, they invite serious mishaps From the point of view of hygiene, then, it would be desirable to employ in preservation of food products no salt that has not been purified and divested of all bacterial contamination

Centenary of the Academy of Medicine

The Academie de medecine will celebrate its centenary in December next and on this occasion Professors Chauffard, Delorme, Pinard, Vaillard, Camus, Meillere and Henriot will recount the work of the academy from 1820 to 1920 Moreover, Dr Paul Richer, member of the Academie de medecine and of the Academie des Beaux-Arts has just engraved a beautiful commemorative medal

Amebic Dysentery in France

Although before the war, amebic dysentery was rarely seen in France, the situation has completely changed since then, a fact to which Dr Marcel Labbe recently called special attention Dr Labbe attributes this change to the following causes 1 A great number of French soldiers on duty with the forces in the Orient returned in an infected condition 2 Colonial troops on duty in Europe brought dysentery with them 3 Systematic examination of the stools has led to the disclosure of isolated and autochthonous cases, probably of long standing, in various districts Be that as it may, amebic dysentery represents today an infection to be reckoned with in France, being found even among elements of Parisian society the members of which have never been in the colonies and have not come in contact with colonial troops Besides this, it is probable that the war has favored dissemination of the disease through the agency of discharged soldiers acting as carriers of the amebae and that the foci of amebiasis established in city and country will continue to multiply It becomes the concern of individuals and of society in general, then, to ferret out these foci promptly

July 30 1920

Vital Statistics for 1918

The report on the vital statistics of England and Wales in 1918 has recently been issued by the registrar-general, Sir Bernard Mallet The year was extraordinarily healthy, notwithstanding the exceptional prevalence of influenza toward its close The civilian deaths numbered 587,828 a rate of 17 6 per thousand of the estimated population, which rate is reduced to 17 1 by correction for age distribution of the living The extent of the reduction was increased during the war by the withdrawal from the civilian population of men at an age when mortality is below the general average But this effect has been masked by the high influenza mortality of 1918 which occurred at these ages Of the total deaths, only 10 5 per cent were those of infants under 1 This is by far the lowest rate of infant mortality recorded the percentage so recently as 1901-1910 having been 22 6 The change is partly due to increased influenza fatality at the higher ages, but mainly to the rapid fall of infant mortality, and to reduction in births In terms of total births, infant mortality in 1918 was equal to 97 per thousand or 9 3 per cent below the average in the ten preceding years It is one of the lowest rates on record, only three previous years having infantile mortality of less than 100 to 1 000 births The provisional figures for 1919 show a rate of 89 per thousand or 2 per thousand below that of 1916 the lowest rate yet attained The comparison, however, is affected by the fact that in 1916 the birth rate was falling, while in 1919 it was rising, and when the necessary allowance has been made for these movements the rates for the two years appear to be about equal

As compared with the preceding year typhoid, measles and diarrhea showed a lower mortality while scarlet fever diphtheria and whooping cough showed a higher The deaths from typhoid numbered 950 of which sixty-five occurred among noncivilians The resultant mortality, 26 per million living, is the lowest ever recorded in this country To some extent the fall is due to absence, on foreign service, of a large number of men of the ages at which typhoid mortality is highest The remarkable fall from 300 deaths per million living in 1869 to 26 in 1918 may be followed in a new table which indicates that the loss of life from this disease is now only one third of what it was even ten years ago The disease is rapidly losing its significance as a cause of death in this country

The influenza epidemic which commenced about midsummer in 1918 increased the deaths from this cause from 5 000 to 10 000 usually recorded in a year to no fewer than 112 329, the death rate being 3 129 per million living In addition the epidemic led to a large increase in the loss of life assigned to diseases of the lungs including tuberculosis The total deaths attributable to influenza have been estimated at 132 000

Tuberculosis in its various forms accounted for 58,073 deaths, or 2,139 more than the previous year The mortality among the civilian population amounted to 1 694 per million a figure in excess of that recorded for any year since 1904 The increase was probably due to the epidemic of influenza, had it not been for which the tuberculosis mortality would probably have shown some reduction on that of 1917 The mortality from influenza among sufferers from phthisis greatly exceeded that of the general community A remarkable increase in deaths from tuberculosis in lunatic asylums has been continued throughout 1918, when the fatal cases amounted to 5,605, against 4,189 in the previous year, and an average of 1,800 in the three years 1912-1914 This increase has occurred notwithstanding a decline in the number of inmates It is ascribed mainly to reduction in quantity and deterioration in quality of food (particularly flour) Other causes of a secondary importance are deterioration of the asylum staffs and want of space for isolation, owing to the evacuation of some asylum buildings for war purposes and consequent congestion of the remainder Cancer mortality if stated in the form of an ordinary crude death rate was higher than in any other year, but if comparison is made by means of standard rates which allow for the abnormal age constitution of the male civilian population, there is an appreciable decrease from the previous years record

The Influenza Pandemic in India

The report of Lieutenant-Colonel Forster of the Indian Medical Service, sanitary commissioner for the Punjab which contains an estimated population of 20 000 000 gives a graphic account of the ravages of the pandemic of influenza in 1918 The death rate of the province rose to 81 per thousand the highest recorded since 1867 The excess was entirely due to influenza As occurred in England, the disease selected

adults for its victims and was complicated by a peculiarly fatal type of pneumonia From October 15 to November 8, the state of the province was such as to defy adequate description The hospitals were choked so that it was impossible to remove the dead quickly enough to make room for the dying, the streets and lanes of the cities were littered with dead and dying people, the postal and telegraph services were completely disorganized, the train service continued, but at all the principal stations dead and dying people were being removed from the trains, the burning ghats and burial grounds were literally swamped with corpses, while an even greater number awaited removal, the depleted medical service, itself sorely stricken by the epidemic, was incapable of dealing with more than a minute fraction of the sickness, nearly every household was lamenting a death and terror and confusion reigned everywhere The great malaria epidemic of 1908 and the worst years of plague fade into insignificance beside this epidemic, which in three months, October-December, killed 962 937 people This mortality is equivalent to 45 8 per thousand of the estimated population The European population escaped lightly Among commissioned officers and their families and for Europeans generally, the mortality was trifling, well under 5 per cent of the cases For the Indian population of the better class and among those provided with medical aid, it is estimated at about 6 per cent , among the poorer classes "anything from 50 per cent upward" Among the jail population in the province there were 4,475 cases and 520 deaths from influenza, giving a case mortality of 11 6 per cent Rural areas suffered more than the towns, this being due to the two circumstances that for practical purposes the rural areas even in normal times are without qualified medical aid and the rural population is unable to benefit from communal effort—itself energized by competent directing authority—to anything like the same extent as the urban population

Increased Workmen's Compensation

The workmen's compensation act of 1906 rendered employers liable to pay compensation for injuries to workmen arising in or out of their employment A committee appointed by the government has recommended large increases, which will no doubt be adopted, and also state supervision of the rates charged by insurance companies with a view of restriction of their profits Not more than 30 per cent of the premium income is to be expended in profits, management expenses and commission Insurance, which was previously optional, is with certain exceptions made compulsory on employers It is proposed to bring within the scope of the act large new classes of persons 1 Persons employed otherwise than by way of manual labor whose remuneration is at a rate not exceeding $1 750 a year instead of $1 250 under the existing act 2 Casual employment for the purpose of any game or recreation when the persons employed are engaged or paid through a club Otherwise casual employment is to remain as at present 3 Taxicab drivers who on the ground that they are the bailees of their cabs rather than the servants of the cabowner are at present excluded 4 Shore fishermen employed in the trawler industry 5 Shore fishermen employed in the herring or other fishery to be brought within the act by order of the commissioner, if he is satisfied after public inquiry that they ought to be included 6 All persons ordinarily resident in this country who are employed or are traveling in the course of their employment in a British ship -

Benefits are to be much increased In fatal cases the benefits for total dependents are to be on the following scale 1 When a widow is left $1,250 2 When the person killed leaves a child or children a weekly allowance of $2 50 for the first, $1.75 for the second and $1 50 for every other child The allowances are to be provided by the payment by the employer into a central fund of $2 500 in every case of a workman's dying and leaving a child or children under 15 years of age 3 When other dependents are left, in addition to the benefits mentioned above a further sum of $2,500 4 When dependents are left, not including widow or children, $1 250 The maximum liability for compensation in respect of a workman's death will thus be $4,000, which compares with a present maximum of $1 500 The provision for investing money for children is new In the case of partial dependents a sum representing the value of the late workmen's contributions to the support of the partial dependents shall be payable with a maximum of $1 250 Burial and medical expenses are to be increased to $75 The original maximum benefit payable in the cases of total incapacity was $5 a week In September, 1917 this was raised to $6 at which rate it was continued until the end of 1919 January 1 last the maximum became $9 It is now proposed that the total payment shall be 66⅔ per cent of the average weekly earnings, with a maximum of $15 In the event of partial incapacity, payment is to be on the basis of two thirds of the difference between the average weekly earnings before the accident and the average amount the workman is earning or is able to earn in some suitable employment after the accident Provision is also made that when the workmen can show that the rate of wages generally paid by employers to workmen in that occupation in the district at the time of his accident has at any time thereafter increased by upward of 20 per cent he is at liberty to claim compensation on the basis of the difference between what he is at present earning or able to earn and what he would at that time have been earning or able to earn had he received the benefit of such rise, the employer to be entitled to make a corresponding application for reduction in respect of a wage decrease Any medical and surgical aid necessary in addition to the medical treatment already available under the national health insurance acts is to be provided for the injured workman at the cost of the employer under a comprehensive scheme to be worked out by the proposed commissioner in cooperation with the ministry of health

The American Hospital in London

Considerable progress has been made in establishing the American Hospital in London mentioned in previous letters The hospital will be incorporated under the laws of the state of New York, and a campaign will be opened to raise an endowment fund of several million dollars The American Hospital will give medical aid by modern American and British methods irrespective of nationality or creed It will act as the American headquarters in Europe for all Americans who seek a further and specialized medical education overseas The plans of the building include laboratories libraries and other facilities for graduate medical study, with conference and lecture halls The hospital will be managed by joint American and British committees but the London council of management will consist as to three fourths of its members of American citizens The presidency in the United States has been accepted by Hon William H Taft, the Earl of Reading having consented to act as president in this country The board of governors includes the best known members of the American colony in London Two medical committees have been appointed to act in each country That in the United States consists of Drs G W Crile, W J Mayo C H Mayo A J Ochsner, Rudolph Matas and Franklin Martin This committee will have the duty of nominating the American members of the staff and will work in close conjunction with the English medical committee consisting of Sir Arbuthnot Lane, Sir Humphry Rolleston Sir John Bland-Sutton, Sir John Y MacAlister and Mr Philip Franklin

The Imperial Entomological Conference

Under government auspices the Imperial Entomological Conference consisting of delegates from various parts of the British Empire, has met in London The subjects for discussion were mainly economic 'Legislation in Regard to Plant Pests in the British Empire," "Cotton Pests," Organization of Entomological Work in the Sudan," The Education of Economic Entomologists," 'The Tsetse-Fly Problem" 'Resistance of Plants to Insect Attacks," 'Insect Pests of British Guiana," 'Insect Pests of Trinidad," "Artificial versus Natural Methods of Control of Insect Pests," and "Insects in Relation to Afforestation' The conference has arisen in connection with the Imperial Bureau of Entomology, which was founded by the Colonial Office at the beginning of the century It was decided that representatives from all places where economic entomology is studied should be invited to attend a periodic meeting in London The bureau is financed by the various governments who contribute annually sums of money ranging from $2,500 a year from the home government, Canada, India and Nigeria, down to $125 a year from the Seychelles and Newfoundland, and $100 from Malta

The bureau issues two quite important publications The first is the *Review of Applied Entomology,* a monthly periodical divided into Series A and B the former dealing with plant injuries caused by insects, the latter with insects harmful to man and domestic animals This review contains abstracts from current literature from all parts of the world and forms a very complete survey of applied entomology throughout the world By it, medical officers veterinary surgeons and entomologists in the remotest outposts of the empire are informed of the latest developments in their subjects The bureau also publishes the *Bulletin of Entomological Research* This consists largely of papers founded on the material sent home from the numerous collectors, and papers, chiefly of a systematic and bionomic character, contributed by various zoologists and other investigators Perhaps the most important work the bureau undertakes is the identification of insects This is a colossal task Since 1913, no fewer than 1 218 collections have been received, comprising more than 300 000 insects, of which about one third were blood sucking and the number of specific identifications involved has amounted to more than 20,000 Most of this work has been done by the staff, but various experts have been from time to time called in and have readily given their special knowledge to the bureau Named collections of injurious insects have been sent out to nearly forty different institutions Further, much progress has been made in the preparation of a catalogue of plant pests throughout the world Another duty the bureau has undertaken is to train young entomologists for work in the field—mainly in the American field—and this they have been able to do through the generosity of the late Mr Andrew Carnegie The bureau has also sent out special expeditions dealing with such subjects as the habits and distribution of the tsetse-fly, which conveys sleeping sickness, blood-sucking flies of the family *Tabanidae* (horse-flies, or gadflies) and the occurrence of *Stegomyia* in the East, which, owing to the opening of the Panama Canal, may become a danger to eastern Asia, as this mosquito is a carrier of yellow fever

Anthrax in the Navy

At the recent Brussels conference on public health Surg-Capt Bassett Smith read an interesting paper on the occurrence of anthrax in shaving brushes He pointed out that owing to the war the supply of shaving brushes was cut off Previously manufacturers realized the importance of not making brushes from hair derived from Russian, Japanese or Chinese sources as the hair from these countries was infected with anthrax in a large proportion of cases Some of the small manufacturers starting during the war to manufacture brushes in England being ignorant of this danger used the Chinese source of supply The result was that a number of anthrax-infected brushes were now on the market Six cases occurred in the navy, with four deaths Those who died showed marked cerebral symptoms and were diagnosed in the first instance as having cerebrospinal fever', but the anthrax bacillus was later recovered from the cerebrospinal fluid

The violent nature of the cases was perhaps due to the original infection being on the face. Preventive measures consisted in bacteriologic examination of all samples of hair or brushes, and rigid discarding of any consignment in which even one infected brush is found Routine sterilization of brushes should also be carried out In previous letters, cases of anthrax in civil life due to the use of Japanese shaving brushes have been reported and the government has in consequence prohibited their importation

Plague and Yellow Fever

As far as plague is concerned conditions are quite satisfactory at Vera Cruz since no new human cases have occurred besides the fifty-eight already mentioned At the pesthouse there remain only four patients The rat plague epizootic is apparently decreasing as few of the trapped animals are found infected by *B pestis* The president of the department of public health has ordered the reopening of the port although some precautionary measures will still be enforced as the detention and examination of notoriously unclean persons, who may carry fleas, forbidding the taking out of cats through Vera Cruz as they might contain the same parasites, and declaring antiplague vaccination optional Ships must remain at a distance from the wharf the cables will be properly protected and fumigation of shipholds will be compulsory before leaving port It has just been ordered that all cellars must be made rat-proof in a month, and the antirodent campaign will be continued indefinitely

In the port of Tampico another case of plague was discovered two days ago The campaign is being pushed in order to prevent the spread of the disease

As regards yellow fever I cannot speak so favorably The disease has increased and fifty-two cases with twelve deaths have been reported up to yesterday Possibly not all these cases are real fever,' but the majority undoubtedly are There have occurred at Merida two other cases of the same disease and three in the port of Progreso In view of the alarming increase of the epidemic, the department of public health ordered Dr B Vasconcelos to proceed to Vera Cruz to make an inspection and report on the causes of the reappearance and spread of yellow fever As a result of his report energetic measures have been adopted The personnel in charge of the campaign at Vera Cruz was changed, and Dr Manuel Macias who was in charge of the work in Dr Liceaga's time has again been made chief of this service An engineer has been sent to carry out the sanitary works considered most urgent and the number of sanitary inspectors has been increased in order to detect all patients and water containers not properly protected The number of oilers has also been increased In view of the fact that yellow fever was eradicated twelve years ago the people have grown careless with regard to water containers and a campaign of publicity will be carried out through the newspapers public lectures and films Dr Carl Michel of the U S Public Health Service has promised to obtain some appropriate

films from his country It has been advised to continue the use of neo arsphenamin in patients as it has given encouraging results, and the campaign will be intensified until the epidemic is completely eradicated It may be well to mention that the presence of yellow fever was confirmed not only by purely clinical data, but also through infecting a series of guinea-pigs with the patient's blood In one of these animals there was found in the blood and liver a parasite, conforming to the characters of Noguchi's leptospira, which, *though not studied culturally thus far is considered* identical These identification studies have been carried out by Dr Pedro Perez Grovas, in charge of the plague laboratory established recently

The preparation of the bacterial vaccine tried by Noguchi on guinea-pigs has been begun and while no accurate information is available as to the results obtained on human patients in Peru, it is hoped that it may be a powerful aid against yellow fever Some persons who had to visit the infected port asked to be vaccinated and for this purpose there was employed a small quantity of vaccine that Noguchi presented when he was last here

Opium Traffic

The police seized in an express office more than 500 Gm of 'cooked" opium received from Manzanillo and shipped to a person with a fictitious name, who has not been identified This opium has an estimated value of 200 000 pesos and has been placed at the disposal of the public health department by orders of the president It is assumed that this opium was intended as on previous occasions, to be smuggled into the United States, as in this country there are not many opium addicts

New Scientific Society

There has been organized the Mexican Society of Biology which for the time being will hold its meetings at the headquarters of the National Academy of Medicine The officers of the association are president Dr D Fernando Ocaranza, treasurer Dr. Eliseo Ramirez, and secretary, Dr Isaac Ocheterena Their employ has ten charter members, practically all phys[illegible] has [illegible]e address is Av del Brasil, No 33, Mexico

Scientific Delegation to Latin America

Dr D Sebastian Recasens a prominent Spanish physician, and Dr D Florestan Aguilar King Alphonso's dentist are planning a trip of cultural propaganda in Latin America during which they will visit Argentina Chile, Mexico and other countries on this hemisphere At the same time they will invite American physicians to attend the Spanish-American Medical Congress that will meet in Seville, and try to establish personal relations between Spanish and Latin American physicians

Personal

The Academy of Medicine has just received as a member in the section of legal medicine Dr F Castillo Najera who presented a thesis on hematologic investigations on the cadaver in order to determine whether traumatic lesions presented by dead bodies were caused in vita or postmortem ——Dr Carl Michel has arrived from Vera Cruz for a conference with the head of the department of public health on matters relating to sanitary conditions at the above mentioned port Dr O Gonzalez Fabela who until recently was in charge of the yellow fever campaign at Vera Cruz arrived with Dr Michel——Dr Nicolas Remirez de Arellano has resumed his functions as a member of the board of public health He had obtained this position many years ago in open competition and was deprived of it by the previous government He had also been professor and dean of the School of Medicine.

Marriages

SAMUEL H JAMES Major M C U S Army, Whipple Barracks Prescott Ariz, to Miss Afra Myron of Glenwood, Minn recently

GEORGE E PICKETT, Lieutenant M C, U S Army, to Miss June D Oglesby of Salt Lake City, at Washington, D C, August 19

RUSSEL DAVID BUSSDICKER Lieutenant M C U S Navy, Philadelphia, to Miss Lulu Blanche Gillis, at Kinsman, Ohio, August 11

CLARENCE M DARGAN Beverly Hills, Chicago to Miss Madge Grove of Pontiac, Ill August 3

ROWLAND W BACHMAN Allentown Pa to Miss Rose Elizabeth Johnson of Easton Pa August 4

JOHN W WILCE, Columbus Ohio, to Miss Minerva W Conner of Cincinnati, August 2

Deaths

Emil Heuel ⊕ New York, University of the City of New York 1883 aged 57 a member, secretary vice president and president of the American Electro-Therapeutic Association a Fellow of the New York Academy of Medicine, visiting surgeon to St Joseph's St Luke's and Polyclinic hospitals, Lieutenant M C N Y N G, a specialist in diseases of the nose and throat, died August 11

Daniel J Phelan ⊕ San Jose Calif formerly of New York Bellevue Hospital Medical College 1895, a specialist in pediatrics, aged 56, visiting physician to St Luke's St Elizabeth's and Bellevue hospitals who had been operated on twice at the O Connor Hospital San Jose, died, August 9

Thomas H McKee ⊕ Buffalo N Y, University of Buffalo N Y 1898, aged 57, Major M C U S Army, and discharged November 9 1918, lecturer on surgical anatomy and dean of the faculty of his alma mater, president of the Roswell Park Club, died August 1, from pneumonia

Kirby Curtis Garner, St Louis, Beaumont Hospital Medical College, St Louis 1901, aged 41, a member of the Missouri State Medical Association died in the St Louis City Hospital, August 5 from injuries received in a collision between his automobile and a motorcycle

John Kenwood Dawson, Sterling Colo Queens University, Kingston Ont, 1903 aged 45 a member of the Colorado State Medical Society, a veteran of the war with Spain, president of the Northeastern (Colo) Medical Society in 1918 died August 8 from heart disease

Sherman Cooper, New York, New York Medical College, New York 1857, for sixty years a practitioner of Westfield N J aged 87, surgeon of U S Volunteers during the Civil War died at the home of his daughter in New York, August 9

Henry Elsifer Mereness, Albany ⊕N Y, Albany (N Y) Medical College 1874, aged 71, a member of the Medical Society of the State of New York, acting assistant surgeon, U S P H Service since 1880, died, August 4, from heart disease

William Monroe Handleman, New York, Long Island College Hospital Brooklyn 1911 aged 30 Lieutenant M C, U S Army and discharged May 14 1919 attending physician to the Hebrew National Orphan Asylum, died, August 8

Redfield Benjamin West, Guilford Conn University of the City of New York 1879 aged 72 a member of the Connecticut State Medical Society state chemist since 1893, health officer of Guilford since 1897, died, July 12

George David Heist ⊕ Philadelphia Jefferson Medical College 1917 aged 35, Lieutenant M C U S Army, and discharged June 6 1919, died in the Jewish Hospital, Philadelphia August 8 from cerebrospinal meningitis

⊕ Indicates Fellow of the American Medical Association

Charles Earl Daily, Lake Taneycomo, Mo , Central College of Physicians and Surgeons of Indianapolis, 1898, aged 50, died at a hospital in Springfield, Mo, June 8, from peritonitis, following an operation for appendicitis

John W Howell, Bryan, Texas, Southern Medical College, Atlanta, Ga , 1883, aged 61 chairman of the board of directors of the First National Bank of Bryan, died in a hospital in Galveston, Texas, August 6

Peter H Heller, Pueblo, Colo , Georgetown University, Washington, D C , aged 74, a member of the Colorado State Medical Society, physician to the Sacred Heart Orphanage, died, August 3, from nephritis

Beniah L Lewis, Harrington, Del , University of Pennsylvania, Philadelphia, 1873, aged 72, once a member of the Delaware state senate and speaker of the house of representatives, died, July 30

Charles W Radway, Mexico, N Y , New York Homeopathic Medical College, New York, 1876, a member of the Medical Society of the State of New York, died, August 2

Lorenzo John Locy ⊕ Davison, Mich , University of Michigan Ann Arbor, 1881, aged 64, died in the Goodrich (Mich) General Hospital, August 16, from cerebral hemorrhage

Thomas Upham Coe ⊕ Bangor, Me , Jefferson Medical College, 1861, aged 82, a large timber owner, died at his summer home in Kineo, Me, July 31, from pneumonia

Roselette Bird, Beaver Dam Wis , College of Physicians and Surgeons, Keokuk, Iowa, 1894, aged 71, died in Waukesha, Wis, July 10, from bronchopneumonia

Ernest Theodore Kegel, Gainesville, Fla , State University of Iowa, Iowa City, 1896, aged 45, a member of the Florida Medical Association, died, August 11

George W Beach, Apalachin, N Y , Yale University, New Haven, Conn, 1864, aged 81, died in Binghamton, N Y, June 10, from senile debility

George Eliot Klingerman ⊕ Oakland, Calif , George Washington University, Washington, D C, 1910, aged 32, died in Glendale, Calif, May 27

Orville B Thompson, Oklahoma City, Bellevue Medical College, 1866, aged 79, died at the home of his daughter in Ardmore, Okla, July 30

Samuel George Barton, Toronto, Ont , University of Victoria College Cobourg, Ont, 1887, aged 58, died, April 21, from heart disease

William C Lewin ⊕ Buffalo, N Y , Niagara University, Buffalo, N Y, 1895, aged 57, a specialist in ophthalmology, died, August 1

Frederick A Strasenburgh ⊕ Avon, N Y , University of Buffalo N Y, 1886, aged 57, died, August 2, from cerebral hemorrhage

Karl J Severance ⊕ Keeseville, N Y , Hahnemann Medical College, Chicago, 1889, aged 54, died, July 28 from meningitis

Stanley Davis Terry, New York, College of Physicians and Surgeons in the City of New York 1875, aged 73, died August 8

James F Sherman, Rochester, N Y , University of Buffalo, N Y 1885, aged 58, died at his summer home White City, August 4

Edward W Crecelius, Norwalk, Ohio, Cleveland Homeopathic Medical College, 1900, aged 48, died, July 10, from tetanus

Mary E Smith, Elk Run Pa , Homeopathic Hospital College, Cleveland Ohio 1887, aged 72, died, July 30

John A Bland, Edinburg Ind Cincinnati College of Medicine and Surgery, 1865, aged 82, died, August 12

Jay D Van Wirt, Johnsonville N Y , Albany (N Y) Medical College, 1883, aged 61, died July 22

Henry C Chapin, Oil City Pa , University of Wooster Cleveland, 1878, died August 3, from asthma

John L Butterworth, Nashville Tenn , University of Nashville, Tenn, 1888, aged 51, died, August 2

William J Karlsroe, New York University of Louisville, Ky , 1893, aged 71, died August 8

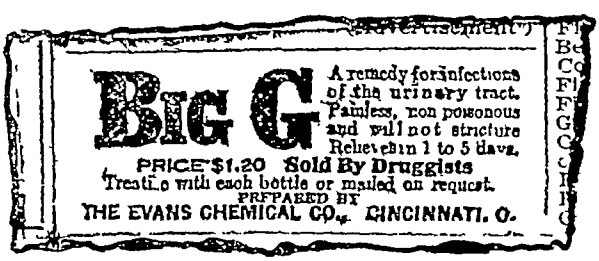
The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE JOURNAL'S BUREAU OF INVESTIGATION OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE FRAUD ON THE PUBLIC AND ON THE PROFESSION

MORE MISBRANDED NOSTRUMS AND DRUG PRODUCTS

Tonic Remedy—Ten boxes of this preparation were consigned in November, 1918, by Teele & Co of San Francisco, and were seized by the federal authorities in Seattle The preparation a nostrum of the alcoholic type, was labeled A Remedy for Chronic Diseases, Nervous System, Blood, Stomach, Kidney Troubles and Rheumatism' and was said to be "Prepared by Dr Yan Nin Tong, Canton, China' It was declared misbranded because the label failed to show the quantity or proportion of alcohol present and because the therapeutic claims were false and fraudulent No claimant appeared and the court adjudged it condemned and forfeited and ordered that it should be destroyed by the United States marshal—[*Notice of Judgment No 7009, issued July 7, 1920*]

Big G—In January, 1919 the Evans Chemical Co, Cincinnati, Ohio shipped a quantity of Big G' which was labeled in part 'A Compound of Borated Goldenseal' Analyzed by the federal chemists, it was shown to consist essentially of a watery solution of boric acid and berberin There was no hydrastin present The stuff was declared adulterated because, while it was labeled borated goldenseal, it contained no borated goldenseal and therefore its strength and purity fell below the professed standard and quality under which it was sold It was declared misbranded because it was falsely and fraudulently represented that the product was effective in the treatment, cure or prevention of unnatural discharges of the urinary organs gonorrhea, gleet stricture spermatorrhea bubo, gonorrheal cystitis, balanitis, leukorrhea, whites and a number of other diseases "when in truth and in fact the article did not contain any ingredient or combination of ingredients capable of producing the effects claimed for it" In July 1919 no claimant having appeared the court condemned the property and ordered the United States marshal to destroy it—[*Notice of Judgment No 7210, issued August 16, 1920*]

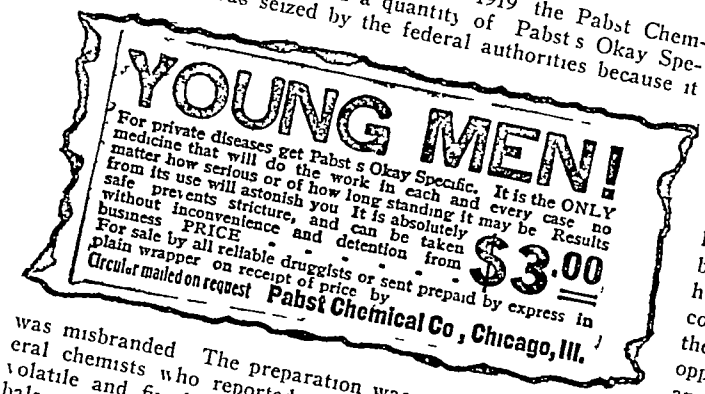


"Plantation Sarsaparilla," "Magic Eye Salve" and "Femenina"—The Van Vleet Mansfield Drug Co, Memphis Tenn, shipped in May 1918 from Tennessee to Alabama and Mississippi, a quantity of 'Plantation Sarsaparilla" Magic Eye Salve" and Femenina ' The federal chemists reported that Plantation Sarsaparilla' was found to consist essentially of potassium iodid alcohol plant material sugar and water This was falsely and fraudulently represented as a cure for chronic rheumatism, lumbago, syphilis scrofula cancer, pimples congestion chills etc The Magic Eye Salve' according to the chemists was found to consist essentially of zinc oxid benzoic acid and petrolatum This was labeled as a cure for all diseases of the eye both acute and chronic These claims of course were declared false and fraudulent 'Femenina was reported by the federal chemists to consis essentially of alcohol sugar water and unidentified material with indications of valer an It was falsel and fraudulently

represented as a cure for diseases peculiar to females, for making women strong and healthy and giving them full sexual capacity, as a cure for falling of the womb nervousness "hysterics" headache, habitual constipation etc In September, 1919, the Van Vleet-Mansfield Drug Co pleaded guilty and was fined $150 and costs—*[Notice of Judgment No 7144, issued July 27, 1920]*

Balsam Copaiba, Salol Compound, and Methylene Blue Compound—The Evans Drug Mfg Co Greensburg, Pa shipped in January and February 1918, a number of boxes of capsules some of which contained Balsam Copaiba, some contained Methylene Blue Compound and others contained Salol Compound Analyses by the Bureau of Chemistry showed that the Copaiba capsules were deficient in quantity from 13 per cent to 23 per cent and that the contents consisted of approximately 50 per cent cotton seed oil The Methylene Blue Compound capsules were deficient in quantity between 25 per cent and 28 per cent and the contents consisted of approximately 50 per cent cotton seed oil The Salol Compound capsules consisted of a mixture containing from 50 per cent to 60 per cent cotton seed oil They were declared adulterated because they were below standard in strength and purity and they were declared misbranded because of the false and misleading statements regarding the contents No claimant appeared for the property and on June 30 1919 the court condemned the product and ordered the United States marshal to destroy it—*[Notice of Judgment No 7177 issued August 13 1920]*

Pabst's Okay Specific—In March 1919 the Pabst Chemical Co, Chicago shipped a quantity of Pabst s Okay Specific which was seized by the federal authorities because it



was misbranded The preparation was analyzed by the federal chemists who reported that it consisted essentially of volatile and fixed oils plant extractives including cubebs balsam of copaiba and buchu and over 29 per cent of alcohol The stuff was declared misbranded because the claims on the trade package represented that the article was effective for the treatment remedy or cure of gonorrhea gleet urethritis and chronic mucous discharge These claims were declared false and fraudulent because the article did not contain any ingredient or combination of ingredients capable of producing the effects claimed In June 1919 no claimant having appeared the court ordered the stuff condemned and destroyed by the United States marshal—*[Notice of Judgment No 7250 issued August 16 1920]*

Liebig's Diarrhoea Cordial—Parker-Blake Co Ltd New Orleans shipped in July 1918 a quantity of Liebig s Diarrhoea Cordial The government chemists reported that this product was found to contain 1/6 grain of morphin sulphate to each fluidounce and 6 27 per cent of alcohol by volume and to consist essentially of a solution of morphin sulphate catechu tannin oil of cassia oil of peppermint sugar, alcohol and water It was declared misbranded first because it was falsely and fraudulently represented as a remedy for cholera and dysentery and second because it was falsely and misleadingly represented as a product that 'may be taken with perfect safety by infants while teething' although the stuff contained morphin sulphate In June 1919 the Parker-Blake Co, Ltd pleaded guilty and was fined $10—*[Notice of Judgment No 7145, issued July 27 1920]*

"DISEASE TRANSMISSION AND THE SCHOOL"

To the Editor—My article (*Weekly Health Review* May 29 1920 published by the Detroit Department of Health), to which Dr Strode referred in THE JOURNAL last week page 557 was a review of the age distribution of certain diseases in Detroit during the calendar year 1919 The percentage of cases by age groups from 1 to 9 was given as well as a summary which indicated that there had occurred prior to the tenth year of age 70 per cent of all scarlet fever, 62 per cent of diphtheria 89 per cent of measles, 96 per cent of whooping cough and 83 per cent of chickenpox In all but whooping cough the greatest amount of disease occurred at 6 years The point was made that, although the child beginning school showed more disease than at other ages this did not necessarily mean that the school was responsible for more disease but rather that the school revealed more disease. To support this contention it was pointed out that the increase in the sixth year over the fifth year was no greater in most instances than the increase of the fifth over the fourth or the fourth over the third year or the second over the first year

If the school were primarily responsible for spreading communicable disease we should naturally expect a marked increase in disease at school age an increase greatly in excess of the increases from year to year among preschool children Such a marked increase among those entering school did not occur in Detroit in 1919 The figures on which the conclusions were based represented 2 664 cases of scarlet fever 3 576 of diphtheria 1 773 of measles 860 of whooping cough and 927 of chickenpox

I maintain that with medical and nursing service such as is provided to the school by the modern city department of health the influence of the school in spreading disease need be no greater than the influences at work among children at home or at play City children have ample opportunity for contracting disease by contact with other children outside the school These opportunities are so multiple that the opportunity offered by contact in the schools makes little, if any difference The influence of contact through school attendance in spreading disease is offset by efficient inspection to eliminate the sick in the early stages of the disease The reason for stating that the school reveals more disease is founded on the work of the nurses In October, November and December 1919 our nurses found in the schoolroom 22 cases of scarlet fever 8 of diphtheria, 14 of whooping cough, 9 of measles 15 of chickenpox and 6 of mumps By going to the home to investigate suspicious absences from school the nurses discovered 21 cases of scarlet fever, 13 of diphtheria 26 of whooping cough, 135 of measles, 45 of chickenpox and 2 of mumps Many of these cases would never have come to the attention of the health department but for the vigilance of the nurses at the school

Nearly 50 per cent of Detroit s population was born abroad Many of the foreign born do not call a physician at times of illness During January fourteen deaths occurred from measles and only three of the number had been reported as cases to the health department In ten cases the physician had been in attendance less than five days prior to the death, or usually not till pneumonia had developed The failure to report was thus due mainly to the fact that the patient was not being attended by a physician Consequently, many cases of disease exist and remain unreported However when a child of school age is sick the fact is soon revealed Reports made to the health department will be more complete for children of school age than for those below

It is quite conceivable that in rural communities with families widely scattered and without adequate medical inspec-

tion, the school serves as an important center for the transmission of communicable disease This need not be true with efficient medical inspection

Dr Strode offers, as supporting evidence that the school spreads disease, the morbidity records for Pennsylvania by months Disease is high in the months when school is open It is lowest in the summer, when the schools are closed This fluctuation is not peculiar to Pennsylvania It is common to the United States as a whole If there were no seasonal changes, we should suspect the school, but climate, weather and season play a great part in the disease fluctuation Scarlet fever is almost an unknown quantity in tropical climates, and yet children go to school

Scarlet fever, diphtheria and measles are low in Los Angeles and New Orleans They are high in colder northern cities

Dr Strode believes that the prevalence of children's diseases during the school session incriminates the school Pneumonia is likewise greater during the school session Lobar pneumonia is not a child's disease Lobar pneumonia is a disease of adults It varies with the seasons, as do scarlet fever and diphtheria, and yet the school influence is wanting

In view of the fact that such a great amount of minor contagion (meaning measles whooping cough and chickenpox, as distinguished from scarlet fever and diphtheria) occurred under 10 years of age, I offered the comment that the "exclusion from school of children above 10 years or at least 12 years because a younger brother or sister had some minor contagion, would hardly justify the time lost from school" It is the custom in many cities to exclude from school all children in families where there is communicable disease, particularly if the previous disease history of the well children is not known It is assumed that they are susceptible or dangerous as possible carriers, and they are kept from school as a safeguard to other children In minor contagion where an isolation of the sick person has been established, it would seem to be the wiser course to give the well children in the household the opportunity of continuing at school, having them report each morning to the nurse or physician If suspicious symptoms appear, then exclusion is in order If not, the children remain at school By this procedure many days of unnecessary absence from school will be avoided

GEORGE T PALMER, D P H, Detroit
Epidemologist, Detroit Department of Health

"WHY PROPRIETARIES FLOURISH"

A Pharmacist's Point of View

To the Editor —The experience of Dr Eggleston and his colleagues (described by Dr Eggleston in THE JOURNAL August 21, p 558) is a severe arraignment of present day pharmacy Briefly stated, the conditions are 1 Instead of prescribing pharmacopeial drugs and depending on the pharmacist to compound the prescriptions, a very large proportion of the medical profession prescribes the ready-made tablets, pills, elixirs and what-not of the pharmaceutical houses or the shotgun mixtures exploited by pharmaceutical specialty concerns 2 As a result of these conditions, the pharmaceutical houses pay little attention to the manufacture of official pharmacopeial preparations, but "push" their own "formulas" Also, because of the rare demand for pharmaceutical training, the present day pharmacist all too often devotes his energy to the promotion of sales of cigars, soda water and toilet articles rather than to the practice of professional pharmacy

How physicians become dependent on pharmaceutical houses for the formulation of their prescriptions is a story that has been told repeatedly in THE JOURNAL To some extent these conditions are being changed through better instruction in medical schools and by the efforts that are being made by the Council on Pharmacy and Chemistry It is a pity, though, that in the meantime men with thorough pharmaceutical training and high professional ideals are, to a very large extent, driven to discard professional aspirations and devote themselves to drug 'trade" for all there is in it

It requires no special pharmaceutical skill or costly equipment to prepare troches of ammonium chlorid, compound laxative pills or emulsion of cod liver oil, or to coat pills with gelatin, and the failure of the pharmacists to fill the prescriptions for these preparations, as cited by Dr Eggleston, and which I acknowledge is just criticism, shows a lamentable condition of lassitude or an inexcusable state of ignorance on the part of the pharmacists in question

In justice to professional pharmacy, however, it should be appreciated that there are trained pharmacists in every large city—and in small ones too—who are competent and anxious to fill prescriptions such as Dr Eggleston and his colleagues write However their professional modesty prevents them from self advertisement It behooves Dr Eggleston and his associates to find them

ANDREW SCHERER, PH G, Chicago

"FURTHER NEW ZOOPARASITES OF MAN"

To the Editor —In THE JOURNAL, July 17, an editorial headed 'Further New Zooparasites of Man' indicates that the newly discovered parasite *Rhabditis hominis* (temporarily named) reported from the Chosen-Government General Hospital, at Seoul, differs in at least one respect from *Strongyloides stercoralis,* in that the former is viviparous, the ova being found in the feces as a differentiating point in the latter As a matter of fact, ova of *Strongyloides stercoralis* are never found in the stools of individuals so infested, their presence being determined only by identifying the young, rhabditiform worms Compared to some of the less frequent intestinal parasites, *Strongyloides stercoralis* is a rather common infestation in his part of the country, the young worms being readily detected in the stools of adults as well as in children In my examination of a large number of stools, over a period of ten years, the incidence of *Strongyloides stercoralis* would compare favorably with findings in the Korean investigation, referred to in this article, in which the new parasite was found in a goodly percentage of more than a thousand school-children examined However, in none of my cases have the ova of *Strongyloides stercoralis* been identified which is more than suggestive of the viviparous nature of this parasite Without further points of differentiation, other than their nature of propagation, these parasites may easily be one and the same

ROBERT F FENNELL, M D, Guntersville, Ala

GRADUATE MEDICAL STUDY ABROAD

To the Editor —Now that the war is over, many American physicians will again attend the medical clinics of Europe With this point in mind I am prompted to relate my experiences of the last few months in Europe I attended clinics in many of the large cities of Germany, such as Hamburg Berlin, Breslau and Leipzig hoping to find conditions in one or more of these cities suitable for my work Abundant material was found everywhere, especially in the dermatologic clinics, where I devoted most of my time. At present there is no organized course for graduate instruction, and owing to the overcrowding conditions, the lack of proper equipment and the

is necessarily performed quite differently from what it was under normal conditions The German physician is not ignorant of these conditions, and naturally has very definite ideas as to the cause of the great change The object of this letter, however, is not concerned with the cause It is simply to remind the American physician who contemplates postgraduate work in Europe that we have been at war with Germany and that this fact is still fresh in the minds of the German physicians

The postgraduate schools of France, Belgium and England are too well known in America for any comment in this letter However, it seems that there are some advantages in the London school which are lacking in other places There is a distinct effort in London to arrange the work in each hospital in such order as to time and place that will enable one to devote the maximum time to his special line For example in dermatology one is able to devote virtually the whole day to clinical demonstrations The courses are outlined in a bulletin that is issued each week by the Fellowship of Medicine and Post-Graduate Medical Association which includes the work at the different hospitals and medical schools such as clinical instruction in wards and outpatient departments clinical lectures and demonstrations afternoon demonstrations laboratory work, etc All of this work is open to the members of the postgraduate school for the nominal sum of £4 a month

J RICHARD ALLISON, A B, M D, London

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed Every letter must contain the writer's name and address but these will be omitted on request

BIOGRAPHIES OF PHYSICIANS NOMINATED FOR THE HALL OF FAME

To the Editor—Please give a brief biographic sketch of the following physicians and surgeons whose names have been placed in nomination for the American Hall of Fame (1) Frank Abbott (2) William Tillinghast Bull (3) John Murray Carnochan (4) Charles T Jackson (5) William Shippen Jr and (6) Lyman Spalding Please omit my name

J C T

1 Frank Abbott is not found in any available list of prominent physicians There was a practitioner of dentistry of that name author of a work on 'Dental Pathology and Practice Philadelphia 1896

2 William Tillinghast Bull (1849-1909) was an eminent surgeon of New York professor of practice of surgery and clinical surgery at the College of Physicians and Surgeons New York, and is credited with an early successful laparotomy for multiple gunshot wounds of the intestine

3 John Murray Carnochan (1817-1887) was a pioneer American surgeon and is credited with the early performance of several daring operations He successfully ligated the femoral artery just below the deep femoral in 1851 was the first in America to excise the entire lower jaw at one operation (1851), to excise the ulna (1853), the radius (1854) and the calcaneum (1857) to excise the superior maxillary nerve including Meckel's ganglion, for facial neuralgia (Carnochan's operation 1856), and to ligate the carotid artery on both sides (1867)

4 Charles T Jackson (1805-1880) was one of the principal figures in the anesthesia controversy In 1835 he opened the first laboratory for the teaching of analytic chemistry in the United States at Boston and was the first to direct attention to the mineral resources of the southern shore of Lake Superior After the successful introduction of ether anesthesia Jackson claimed that he suggested the use of sulphuric ether to Morton and his contentions to the right of discovery were recognized by a considerable number of followers here and abroad

5 William Shippen Jr (1736-1808), of Philadelphia established the first systematic course in anatomy and obstetrics in the United States (privately in 1762), and was professor of anatomy and surgery in the medical department of the College of Philadelphia the first medical school in the United States organized by John Morgan in 1765 He succeeded John Morgan as director-general of the military hospitals and physician-in-chief of the American Army (1777), and was one of the founders of the Philadelphia College of Physicians

6 Lyman Spalding (1775-1821) is best known as the originator of the United States Pharmacopeia (1820) the detailed plan for which he submitted to the Medical Society of the County of New York in 1817 He assisted Nathan Smith in the foundation of the Dartmouth Medical College (1797), was a pioneer in testing publicly the efficacy of vaccination against smallpox (1801) and was a distinguished lecturer on anatomy

TECHNIC OF WASSERMANN TEST

To the Editor—I understand that there has been a new method perfected for making the Wassermann test without the use of fresh sheep's blood I am trying to establish a laboratory in connection with my office and for some cases in a near by hospital My chief difficulty has been that in supplying the great demand for the Wassermann test in this vicinity I am unable to procure sheep's blood or the use of guinea pigs It has been my impression that this new Wassermann test appeared in one of the recent numbers of THE JOURNAL but I have been unable to find the article If you know of this method and feel that it is equally reliable if more simple than the older methods may I not ask you to assist me in obtaining the information I desire?

HENRY B DORR M D Ocean Grove N J

ANSWER—In the performance of the original Wassermann test the use of fresh or of well preserved sheep's blood is essential However some years ago Noguchi (*J Exper Med* **11** 392 1909) introduced a human hemolytic system to replace the sheep hemolytic system of the original Wassermann test using as the cells to be hemolyzed a suspension of human blood cells but employing guinea-pig serum as complement More recently he (*J Exper Med* **28** 43 [July] 1918) has brought out a complete homohemolytic system for the test using human serum as complement instead of the guinea-pig serum employed in all other modifications as complement This modification eliminates the foreign complement and corpuscles from the test for the serodiagnosis of syphilis utilizing fresh human serum for the source of complement for the production of hemolysis on the human corpuscles in the presence of an adequate amount of the specific antihuman amboceptor Full details of this test are outlined in the article mentioned above The results obtained with this modification seem satisfactory and apparently as reliable as those obtained with other modifications of the original technic

SILVER SODIUM SALVARSAN

To the Editor—Please let me have information on silver sodium salvarsan especially as regards its curative powers compared to other arsenic compounds dosage preparation and strength of solutions reactions contraindications etc and also whether it is better to combine it with mercurial treatment Please omit my name

Dr J C R Mexico D F

ANSWER—Ehrlich and his co-workers experimented with the possibility of combining arsphenamin with other metals, they succeeded in making 'copper-arsphenamin' A recent development along the same lines is 'silver salvarsan" According to a recent report of the Medical Research Committee of Great Britain silver salvarsan' is apparently a similar molecular combination of '606' with silver in some form though no details are available as to its exact formula According to Kolle Ehrlich's successor at Frankfort the ratio of the dose which apparently cures experimental syphilis in rabbits to the maximum dose tolerated by the animal is 1 40 as compared with 1 10 in the case of '606' The substance is on trial and its promiscuous use at this time would be ill advised In the United States no license has been granted by the Treasury Department for 'silver salvarsan' and it cannot be sold in interstate commerce Recent abstracts on the subject that have appeared in THE JOURNAL are

Rille and Fruhwald Silver Salvarsan Sodium in the Treatment of Syphilis *Munchen med Wchnschr* **66** 1226 (Oct 24) 1919 abstr THE JOURNAL Feb 21 1920 p 568

Nageli O Silver Sodium Salvarsan *Schweiz med Wchnschr* **50** 161 (Feb 26) 1920 abstr THE JOURNAL May 1 1920 p 1289

Kolle Schlossberger and Leupold Means to Ward Off Arute Effects of Arsphenamin *Med Klin* **16** 355 (April 4) 1920 abstr THE JOURNAL July 10 1920 p 139

Medical Education, Registration and Hospital Service

PLANS FOR MODERN OFFICES FOR PHYSICIANS

RICHARD E SCHMIDT, F A I A
CHICAGO

In planning an office for the physician with a large practice, several points should be kept in view A waiting room of liberal dimensions with an interesting outlook and attractively furnished and decorated should be provided In a suite occupied by several physicians, it may be necessary to have a clerk in the reception room in addition to the telephone operator In any plan it is desirable to have the patients' record files accessible to the clerk, so that records may be delivered to the physician in proper sequence and in advance of the admission of the patient into the physician's office The necessity for an inside private corridor with an exit other than that through the reception room is obvious There is the question whether there should be fewer examination or treatment rooms and more dressing rooms, rather than a large number of examination or treatment rooms with no dressing rooms Both arrangements occupy about the same amount of space but the latter appears to be more satisfactory

To locate an office in a new building is obviously more advantageous than to locate it in an existing building as conduits for wires, pipes for water, steam waste and air can be concealed behind the plaster or under floors, and extended to points immediately adjacent to apparatus resulting in the neatest arrangement whereas in an old building many of these service pipes must be extended on the face of the walls resulting in disfigurement and requiring additional labor to keep them in a presentable condition When a physician obtains a lease of office space while the building is in an early stage of construction the wiring plumbing and heating pipes and other work can be installed in concealed places without the loss caused by alteration of existing work Furthermore outlets may be placed immediately adjacent to the equipment, and there are no unsightly pipe extensions

The selection of materials for walls, floors and finish depends on the use of the offices For treatment or surgical work those standard for hospital work should be used, if the offices are purely consulting or medical, any furnishing or finish suitable for high grade business offices will be satisfactory

In the physician's suite illustrated in Figure 1, the entire floor (1,635 square feet) is tiled with 1¼ inch white ceramic mosaic tile, with rugs in the waiting room and in the private office The walls and ceilings of the private corridor and of the treatment rooms are finished in gloss white enamel The long walls of the filing room back of the bookkeeper's desk are filled with steel safes for records In the private corridor are 25 lineal feet of instrument cabinets, extending from floor to ceiling These cabinets have sliding doors and a unique arrangement by which instruments are suspended from metal bars and placed in regular order, according to their size Instruments arranged in this way are found more quickly than if lying on shelves or in drawers

The roentgen-ray room is arranged for complete roentgenologic treatment, it also contains a plate display box The laboratory is equipped with microscope stand centrifuge constant temperature water bath, gas and electric sterilizer refrigerator incubator water still, and specimen and other cabinets All of the treatment rooms in this suite have running water and modern enameled metal equipment and furniture.

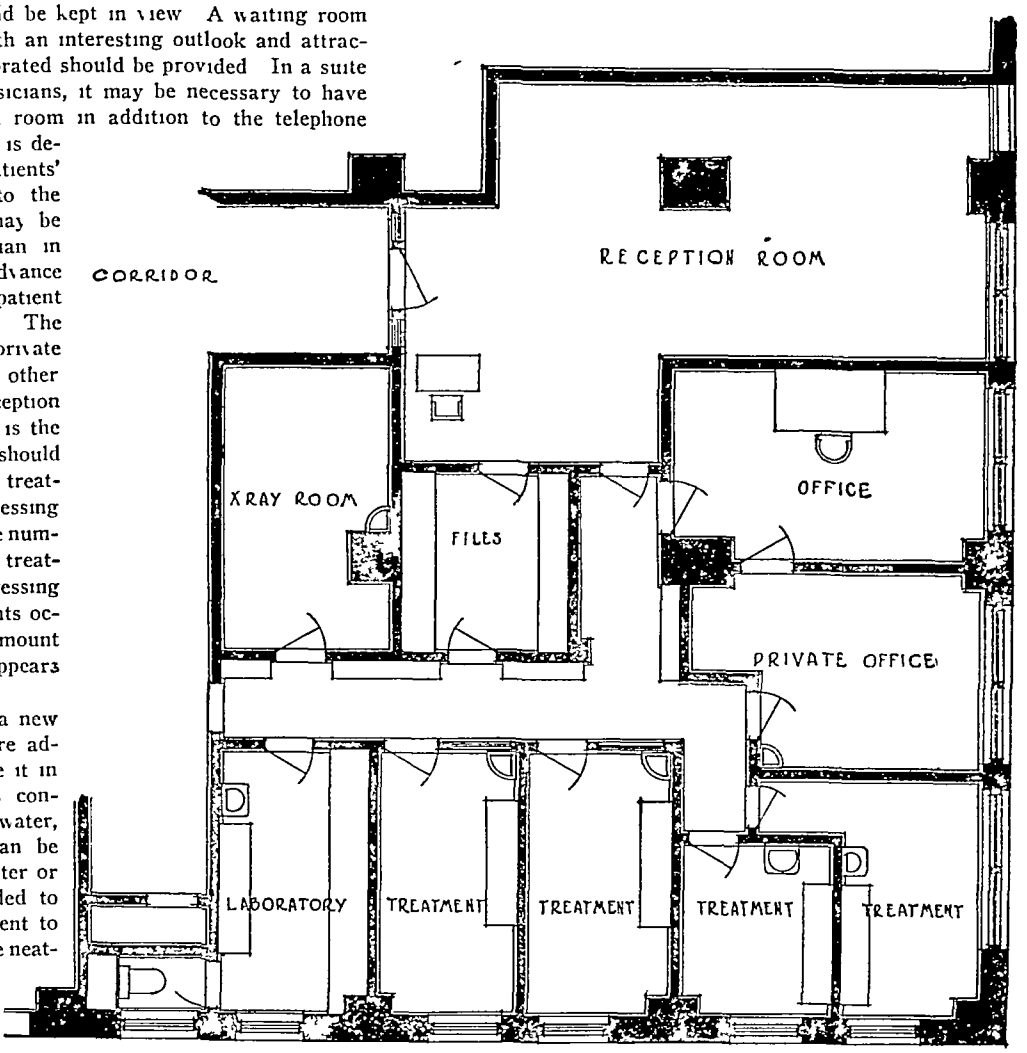

Fig 1—Physician s suite The special features here are the number of treatment rooms with absence of dressing rooms placing of instrument cases in corridor and proximity of file room to recepton room attendant's desk.

The office illustrated in Figure 2 is located in a new office building where the space permitted an excellent and liberal arrangement The roentgen-ray department has a suite consisting of office and plate room, machine room, roentgenographic room, fluoroscopic room, dark room, and toilet and dressing rooms There are two laboratories one of which has a separate dark room and a small room for metabolism tests This small room is equipped with couch and respiration apparatus The laboratory is equipped with autoclave, still, centrifuge, incubator, etc The several offices are equipped with call buttons buzzers and intercommunicating and city telephones The installation of running water in the laboratory and dark room sinks is unusually liberal The conveniences and appointment will obviously be appreciated by the public and by the physician because of the facility with which service can be rendered

Figure 3 shows how a suite of offices was planned for an existing building This group of offices accommodates four specialists representing, respectively, medicine, surgery, dentistry and eye, ear, nose and throat Each office is completely furnished with the equipment adapted to its particular service It will be noticed that three of the suites have patients' dressing rooms with double exits The private corridors furnish necessary intercommunication and exit from the office. One of the important features in connection with this group of offices is an exceptionally large and attractive reception room

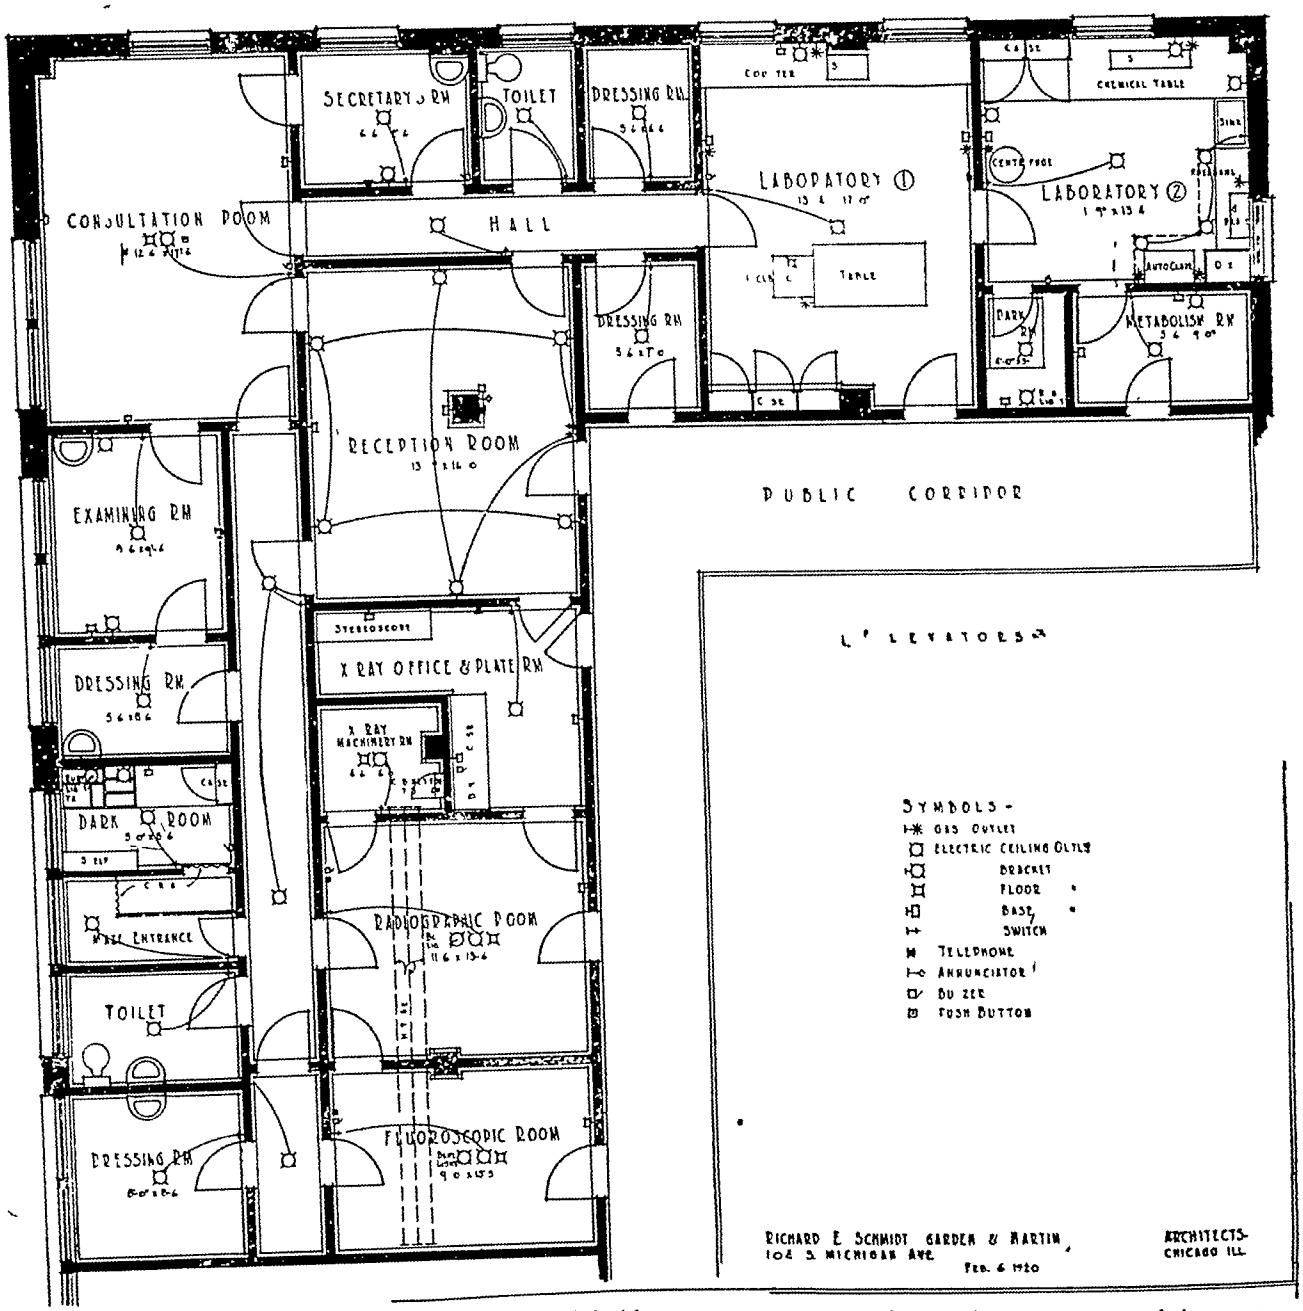

Fig 2.—Noteworthy features here are the liberal size of the laboratories roentgen ray consultation and reception rooms and the arrangement of roentgen ray rooms and auxiliaries

Graduate Course in Public Health

We are informed that a graduate course in public health has been offered at the Ohio State University in cooperation with the state department of health since 1915 During the session of 1919 1920, there were three professors and two instructors in addition to the eleven staff members of the state department of health The course extends over one year and leads to the degree of Master of Science in Public Health The applicant for admission must be a graduate of

a Class A medical school or hold a bachelor's degree from an approved college, in the preparation for which he has completed courses in chemistry, physics, zoology, anatomy physiology and bacteriology A thesis is required for graduation Nine graduate students were enrolled during the session and of this number four graduated with the degree of Master of Science An extension course of two and one-half months was offered and attended by forty-two health officers (physicians) Two courses also were offered in public health nursing one extending over four months and the other over one year, the latter leading to a certificate of public health nursing Two nurses received this certificate during the last year There is also a five-year course in science-nursing leading to a certificate of graduate nurse and a Bachelor of Science degree

Book Notices

HEALTHY LIVING Book One How Children Can Grow Strong for Their Country s Service By Charles Edward Amory Winslow D P H Professor of Public Health Yale Medical School With a Chapter on Physical Exercises by Walter Camp Cloth Price 76 cents Pp 248 with illustrations New York Charles E Merrill Company 1920

HEALTHY LIVING Book Two Principles of Personal and Community Hygiene By Charles Edward Amory Winslow D P H Professor of Public Health Yale University Medical School With a Chapter on Sport and Health by Walter Camp Cloth Price $1 04 Pp 405 with illustrations New York Charles E Merrill Company 1920

In a kindly statement to the children who may use these books Professor Winslow explains their conception and purpose He has tried to describe the human body and how it works He has told of its enemies and how they may be combated He has illustrated his technical points with interesting stories and he has kept to the foreground the patriotism which should animate citizens of a great country to develop that state of health which may enable them best to serve their country He has succeeded remarkably in this difficult task. Those who know of the scientific achievements of the author may well wonder at the pedagogic ability displayed in this work. Perhaps the great interest of the author in his "daughter Nancy aged 10 years who read the manuscript of the book and criticized it from the standpoint of the children who may use it is partly visible. Certain other children of 8 or 10

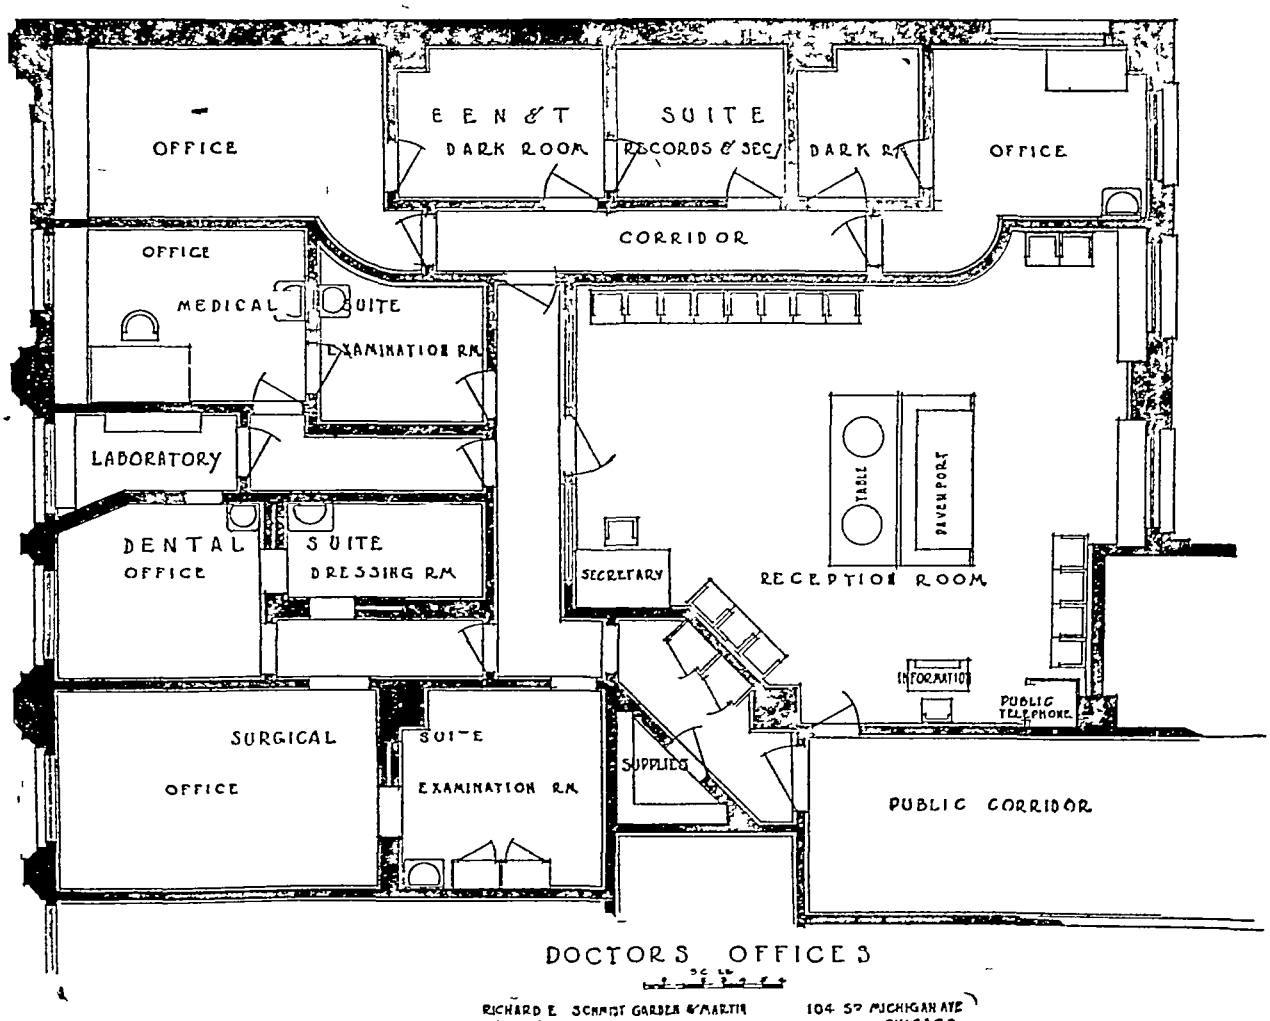

Fig 3—Suite of offices for four specialists Note the liberal dimensions of the reception room also convenient arrangement of eye ear nose and throat suite for eye work

Liability for Malpractice Regardless of License

(Hansen Pock (Mont) 187 Pac R 2)

The Supreme Court of Montana says that it is the rule recognized by the courts generally, that when one holds himself out as a physician or surgeon, whether licensed or not and accepts employment as such to treat a patient he assumes toward the patient the obligation to exercise such reasonable care and skill in that behalf as is usually exercised by physicians or surgeons of good standing of the same system or school of practice in the community in which he resides having due regard to the condition of medical or surgical science at that time It will be observed that under the rule is to be determined by an answer to the inquiry whether he has pursued the rules and regulations of the system or school to which he belongs The law however, is not concerned so much about the school to which he claims to belong nor where he gained the qualifications necessary to enable him to practice It is concerned about the fidelity with which he has met his obligations, and whether he has acquitted himself in the treatment of the particular patient, according to the measure of the standard of those of recognized schools who practice in the same or similar communities For example, in the case of *Nelson v Harrington* 72 Wis 591 40 N W 228 the court was called on to decide the question whether one who holds himself out as a clairvoyant physician, there being no recognized school designated as a clairvoyant school having fixed principles or formulated rules for the treatment of diseases, should be held to the standard which is applicable to ordinary physicians The court concluded that, there being no recognized school of clairvoyant medicine the defendant was properly held liable by the trial court, on the ground that having held himself out as other physicians he had not met the requirements of the rule of law applicable to them So the Supreme Court of Missouri in *Longon v Weltmer* 180 Mo 323 79 S W 655 held that a magnetic healer was liable to a patient to whom the defendant administered treatment which in the opinion of ordinary physicians, could not be justified by the rules of recognized schools though they knew nothing of the principles of magnetic healing In the case of *Musser's Exr v Chase* 29 Ohio St 577, the Supreme Court of Ohio held that a farmer who held himself out as a cancer doctor having skill and experience in the treatment and cure of cancer came within the rule which requires the exercise of such skill and care as are usually possessed and employed by the general physician in the treatment of such maladies" In the case here before the court, plaintiff Hansen had been suffering from pulmonary tuberculosis some twenty years so that the disease had become chronic He was led to consult the defendant a Chinese herb doctor, by having his attention accidentally called to an advertisement of the latter in a newspaper which read 'Dr Hune Pock Professional services to the public and a guaranty of a sure cure for all kinds of diseases including chronic cases of long standing etc The defendant examined him superficially by feeling his pulse and inspecting his tongue, though Hansen gave him a history of his case, telling him that he suffered from hemorrhages due to tuberculosis The defendant made no examination of his lungs, nor did he test his sputum or urine, informing him that his trouble was not tuberculosis but a disease of the kidneys which he could cure Hansen thereupon put himself under the defendant's care for treatment and took the medicine prescribed by the defendant prepared from herbs which the defendant stated had been brought from China Realizing after nearly seven months that though he had not suffered from hemorrhage his condition was not being improved but he was growing weaker Hansen ceased to visit the defendant and to take his medicine The defendant's evidence showed conclusively that he was simply a charlatan without skill or scientific knowledge who made it his business to practice on the ignorant and unwary for gain and while the evidence tending to show that the plaintiff was injured and the amount of damages he was entitled to recover was not very satisfactory, it did furnish a basis for the inference that he suffered some injury The court thinks that the amount of the verdict, $2 500 was excessive, but as no complaint was made of it on that ground the court does not think that it should disturb it

Physical Examinations Under Workmen's Compensation Law

(Texas Employers Ins Ass'n Downing (Texas) 218 S W R 11?)

The Court of Civil Appeals of Texas holds that while in the ordinary case the court is without power to order a physical examination without the consent of the plaintiff, authority to do it is given by the workmen's compensation law of Texas The court says that it thinks it clear that it was the intention of the legislature that the provisions for physical examination should be applicable after the proceeding should have been transferred to the courts as well as while it was pending before the industrial accident board The court has found no authority which denies the consti-

tutional power of the legislature to enact such laws, and it concludes that the court had the power to order such an examination as was asked in this case, in which a motion was made by the defendant insurance association for an order requiring plaintiff Downing to submit himself for examination before a committee of three physicians, to be named by the court one of whom should be a roentgenologist, and one an eye and ear specialist Article 5246—42 of the law gives the association the privilege of having a physical examination made by a physician of its own selection The law does not expressly provide how this privilege shall be enforced nor the penalty for refusal The court takes it that in case of refusal the association should apply to the board or court having jurisdiction of the case, for an order for the examination and it would then be the duty of such tribunal to provide therefor under the power granted by the first paragraph of the section It is probably true that the association before it could complain of the action of the court in refusing to order an examination under its general discretionary authority would be required to allege that it had requested an examination and been refused But when the proceeding has reached this stage that is request for examination by physicians named by the defendant has been made and refused by the plaintiff, the court thinks that the defendant may then apply to the general power of the court, rather than insist on an examination s being made by physicians of its own choosing When the examination is to be made under the order of the court it would seem obvious that an examination by disinterested experts chosen by the court would be more conducive to the ascertainment of the truth than that of physicians selected by the plaintiff's antagonist, whose examination and opinions are more likely to be partisan and in the ordinary case it is more appropriate to request the court to name the examiners The court is therefore of the opinion that if the facts were sufficient to show that an examination was reasonably necessary to a proper development of the truth of the issues for trial, the defendant ought not to be precluded from complaining of the abuse of the discretion of the court in refusing to order the requested examination merely because the defendant requested the court to appoint physicians, instead of naming the physicians itself in the motion

cent of tabetic cases, while lassitude (general tire and weakness) was the next commonest complaint in cerebrospinal syphilis The remaining symptoms are pretty well scattered It is interesting to note that 9 per cent of the total cases gave a history of trauma as the exciting cause of their symptoms, among the secondary complaints Here again pain is the most prominent symptom but close to it comes difficulty in walking (38 per cent in tabetics and 19 per cent in cerebrospinal syphilitics), 26 per cent of all cases have some bladder difficulty, and this is about equally prominent in each group Impaired sexual power, numbness of the extremities girdle sensations, failing vision weakness and lassitude, are the next most frequent complaints in tabes In cerebrospinal syphilis failing vision failing memory loss of consciousness, and vertigo are the next most prominent symptoms while paretics gave a history of mental symptoms and speech difficulties In analyzing the objective physical findings, the pupillary signs sensory changes and abnormal reflexes were the most frequent

*Association of Herpes Zoster and Varicella F L McEwen Chicago —p 205
Syphilis in English Colonies of North America J L Lane New Haven Conn —p 215

Nocardiosis Cutis—A case that agrees with the description of sporotrichosis clinically but which was found to be caused by an organism other than the sporotrichium of Schenck, is reported by Guy

Molluscum Contagiosum—Kingery points out that an abundance of clinical and pathologic evidence favors the existence of the analogue of molluscum contagiosum in fowls Presumptive evidence points to the identity of molluscum contagiosum in man and molluscum epitheliale in lower animals Final proof of the development of molluscum contagiosum from the surface

Icebox Incubation in Wassermann Reaction—Burdick says prolonged twelve hours, primary icebox incubation possesses decided advantages over the short period one-half hour incubator or water bath treatment Serums giving doubtful reactions by the later method of primary incubation frequently are frankly positive by the former method In the series studied both methods gave uniformly negative results in 100 per cent of the clinically nonsyphilitic cases and positive results in 100 per cent of the second stage untreated cases In the second stage treated cases, however, there was a decided difference, especially in the higher percentage positives obtained by the prolonged primary icebox incubation method Likewise this method gave a decidedly higher percentage of positives in the third stage untreated (attaining 100 per cent as compared to 55 per cent by the half-hour water bath method) and the third stage treated cases In the examination of spinal fluids from patients cerebrospinal syphilis there frequently is obtained a positive reaction by the prolonged icebox incubation whereas the conventional water bath method may be negative

Malignant Degeneration of Dermatoses—There are many causes which lead to keratoses and scars and keratoses and scars are more prone to malignant degeneration than is normal skin, but Williams says the number of keratoses and of scars is so enormous and the number of epitheliomas relatively so small that the danger in each individual case is slight indeed Physicians should aim to prevent the formation of these precancerous conditions, to watch and protect them when they appear, to remove them when exposed to injury or when they show signs of changing their character But to recommend the removal of every scar, every naevus, every keratoma, when every person has at least one of these blemishes or to frighten the public with tales of the menace of such growths, is not justified by the facts

Tumor Production by Limiting Oxygen Intake—Smith has produced hyperplasias (1) by the direct application of dilute acids and alkalis to susceptible plant tissues, (2) by the introduction into the tissues of certain foreign organisms (especially the crown gall bacterium which produces acids and alkali in flask cultures and probably also inside the cells as a result of its metabolism), and (3) Smith can now bring about the same results in the absence of parasites and their products by limiting the intake of oxygen, thus compelling the cells themselves to manufacture the stimulus which leads to the development of hyperplasias He suggests that this might take place only as the result of an anaerobic cell respiration acting on the youngest most active cells of a tissue, but there must be always some oxygen of the air present, otherwise there will be complete asphyxiation of the tissues as happened in my first experiments Probably overgrowths due to freezing and to mechanical injuries will also be found to depend on local interference with cell respiration

Radiotherapy of Keloid—Either the roentgen rays or radium can be depended on for the reduction of a keloid The best results will generally be obtained when radiotherapy is combined with excision

Effect of Mercury Salicylate on Wassermann Reaction.—Eighty-seven previously untreated latent syphilitic patients with 4 plus Wassermann reactions were given 1 gram of mercury salicylate intramuscularly at weekly intervals for courses of from six to eight injections The Wassermann reaction immediately after treatment remained strongly positive in 66 per cent of the cases In only 9 per cent was there a reversal to negative and in some such patients who were given a third Wassermann test after an interval without treatment the reaction was positive Goodman says it seems fair to conclude with Nelson and Anderson who carried on a similar study in 1915 that mercury salicylate alone in the dosage and for the period given does not qualify as a curative agent in syphilis In the future he will use mercury salicylate in increasing doses up to 2 and 2 5 grains weekly in an effort to learn whether mercury salicylate in larger doses is effective

Follicultis Decalvans—Senear's four cases occurred in women aged respectively 55 43 43 and 30 years In all four follicultis decalvans was of long standing (ten two ten and twenty-one years respectively) followed by the rather sudden development of follicular eruption of the body whose clinical picture was that of lichen spinulosus Senear supports Adamson's theory of a toxic etiology

Herpes Zoster and Varicella—McEwen reports the cases of a man with zoster who developed varicella which he passed on to a daughter not otherwise exposed and presents certain recommendations deduced from an examination of the literature on this particular association which he says, if followed, would contribute to the clarification of a subject on which there is now great confusion

Pigmented Epithelium of Embryo Chick's Eye Studied in Vivo and in Vitro with Special Reference to Origin and Development of Melanin Pigment D T Smith Baltimore —p 239

Elevation of Surface Temperature Following Resection of Aneurysm.—In 1918 Halsted ligated the left subclavian and carotid arteries near their origin from the aorta for the cure of a huge subclavian aneurysm For a year the aneurysm decreased steadily in size Then it increased in size and developed a faint pulsation It was finally excised and the subclavian and axillary arteries were ligated it was noticed that the left hand and forearm, which for two years had been strikingly cold, had become abnormally warm—appreciably warmer than the corresponding limb About five weeks after operation the hand and forearm became cold again—at first in small areas—remaining cold for only a day or two The sixty-ninth day after the operation, the back of the left hand was quite cold whereas the left palm was about as warm as the right The temperature of the hand and forearm varied from day to day and from hour to hour, certain small quite well-defined areas remained uniformly cool, otherwise the hand and forearm maintained their normal warmth The case is described in full, and Halsted also translates one of the papers of Leriche on periarterial sympathectomy and its results published in the *Presse medicale,* April 20, 1916

Causes of Bacillary Dysentery—The material for Davison's report consisted of the study of 134 cases of diarrhea More than 80 per cent of acute cases of ileocolitis were due to infection with *B dysenteriae B dysenteriae* (either Flexner or Shiga) was not found in the stools of sixty-three cases of simple diarrhea nor in those of 100 normal children Davison suggests that the name ileocolitis should be changed to dysentery in children and the disease made reportable to the health authorities The agglutination reactions of the patient's serum by standardized technic is of assistance in the diagnosis of dysentery *B morgani* No 1 *welchii B paracyaneus B proteus* and the *Streptococcus fecalis* are not the cause of dysentery (ileocolitis) or diarrhea

Benzyl Benzoate in Whooping Cough—The number of cases studied by Macht was about 115 All these cases were characterized by whooping and in many the paroxysms were accompanied by vomiting and small hemorrhages Most of the patients before coming under Macht's observation had been treated by parents or doctors with paregoric and other popular drugs without any benefit, while others had been left alone without any treatment whatever A number of the patients received vaccine treatment but the results in these cases were also not at all striking All other medication was discontinued and the patients were given a 20 per cent solution of benzyl benzoate by mouth The dosage varied from 5 to 40 drops in water, three or four times a day and oftener depending on the age of the patient and the severity of the disease In cases in which the simple alcoholic solution of benzoate was found to be too distasteful to the young patients, it was flavored with a few drops of benzaldehyd and the medicine was administered in sugar, water or milk The addition of a little benzaldehyd to a solution of benzyl benzoate in amounts varying from 1 to 5 per cent produced a mixture which seemed to act more effectively in cases of whooping cough than benzyl benzoate alone It was found that the administration of benzyl benzoate in the form of a suspension in simple elixir in syrup of yerba santa and other syrups or elixirs was not a satisfactory method either of disguising the taste or administering the drug over long periods of time About 90 per cent of all the patients showed more or less beneficial effects about 50 per cent exhibited marked improvement in the symptoms The therapeutic effects of benzyl benzoate were not of a curative character but were of a distinctly palliative nature

*Bordeaux Conception of Lethargic Encephalitis or Epidemic Encephalomyelitis R Cruchet—p 225
Epidemic Encephalitis E D Friedman New York—p 226
Clinical Localization of Vermiform Appendix A Abrams San Francisco—p 229

Recurrent Cholecystitis—The basis of this paper are eighteen cases of recurrent cholecystitis without stones in which operation was performed and in this way the diagnosis corroborated per autopsiam in vivo Einhorn states that a diagnosis of chronic recurrent cholecystitis can frequently be made even when stones are absent by the symptoms present in conjunction with a direct examination of the bile When operating for cholecystitis he advises that a chronically diseased gallbladder should be excised even if no stones are found in the affected organ As to the surgery of the gallbladder Meyer states that so far as indications point today it appears to be better surgery to extirpate the infected gallbladder without stones than to drain or leave it in place Such a bladder stitched to the abdominal wall though at first drained for quite some time may in the future come to represent an infected focus from which the system is intermittently flooded with toxins If secondary cholecystectomy is refused by the patient chronic pancreatitis may develop in addition to the chronic recurring cholecystitis and invalidism may develop for the remainder of life The results accruing from cholecystectomy are almost as good as those of appendectomy

Lethargic Encephalitis—The Bordeaux conception of lethargic encephalitis or rather epidemic encephalomyelitis (or Cruchet's disease as it is still called in the Gironde region) is that which has been adopted in England, the United States Spain and the South American countries accepted first in France in the great local centers such as Lyon Nancy and Bordeaux, it has finally been accepted also in Paris

Use of Thomas Bed Knee Splint for Routine Treatment of Fracture of Shaft of Femur W H Cole St Paul—p 391

Mortality in Auricular Fibrillation—An analysis of 500 cases by Willius has shown that the mortality attending auricular fibrillation doubles and in some groups trebles that occurring in similar types of heart disease not complicated

by this arrhythmia It is logical to conclude, therefore, that patients suffering from heart disease in whom auricular fibrillation has not occurred have a considerably greater life expectancy

Better Way to Give Benzyl Benzoate—To overcome the unpleasant, bitter, burning taste of the alcoholic solution of benzyl benzoate Hirschfelder gives pure benzyl benzoate, 10 parts, emulsion of acacia, 5 parts, elixir eriodictyon aromaticum (N F), 35 parts, dose, one teaspoonful He has been able to secure relief of symptoms in a considerable number of cases of conditions caused by spasm of smooth muscle, cardiospasm pylorospasm, pain in gastric ulcer from aspastic constipation The relief occurs within half an hour after taking and lasts Benzyl benzoate brings about relief in many but by no means all, cases of bronchial asthma, just as is true of atropin or other drugs that inhibit the vagus Still more striking results have been obtained in the treatment of dysmenorrhea About 80 per cent of the patients have had relief from pain after from one to three doses

Blood Transfusion—The sodium citrate method is the method of choice, Schaaf says especially in hemophilia, purpura and melena neonatorum In cases of severe streptococcic infections transfusion is of no value but in low grade subacute infections and in toxemias, it will increase the patient's resistance and help toward recovery In pernicious anemia in a majority of cases it will produce immediate general improvement and facilitate feeding by increasing the appetite and causing the disappearance of nausea and other symptoms annoying to the patient when other therapeutic measures would require weeks to produce the same efforts In many cases of pernicious anemia transfusion may cause a remission but whether by direct stimulation of the bone marrow or indirectly by improving the general condition and circulation has not been decided Transfusion may have to be repeated again and again to keep the patient alive until another remission occurs In pernicious anemia the transfussion of blood has a decidedly beneficial influence but has no curative value whatsoever

Summer Diarrhea of Infants—An examination of the stools of more than 300 infants suffering from diarrheal diseases has convinced Zahorsky of the value of such examination in differentiating the functional from the inflammatory varieties of diarrhea It has become a routine practice with him to examine all stools in regard to their cell content In the treatment of these diarrheas he has been impressed with the clinical value of fruit juices with the water in these cases—orange juice grape juice, apple juice and peach juice have been used

Feeding Athreptic Infants—The essential points brought out by Lonsway are first, the condition depends on starvation which may be due to insufficient food vomiting, or failure of absorption because of diarrhea These, in turn, result in circulatory disturbances with more or less functional incapacity of practically all the vital organs The condition may be prevented by proper attention to the feeding emphasizing the importance of breast milk or if this is not obtainable a properly modified cow's milk mixture The treatment consists of administering a food which can be given in sufficient amounts to achieve a gain in weight without causing a digestive upset Breast milk is always to be preferred, but if this is not available an excellent substitute is whole lactic acid milk with added carbohydrate in the form of corn syrup This mixture can be given in large amounts over long periods of time with the happiest results

Brain Injury Causing Hemianopsia—Jackson reports the case of a soldier who sustained a severe head injury A large fragment of shell case entered the right occipital lobe carrying with it a portion of cap hair and bone fragments The patient was received twelve hours after injury in a semiconscious condition Jackson excised the wound and removed all damaged skull tissue, but could not follow out the en bloc method as the hole was too large and stellate lines of fracture radiated from the wound The damaged brain, indriven bone fragments and foreign bodies were removed, the tentorium being exposed in the process A few months after operation about the only real signs of his wound were the deep occipital depression and an almost complete hemianopsia

Removal of Cataract—The object of Vail's paper is to encourage those who undertake the operation for cataract to adopt Smith's method throughout in every case where the lens will show a disposition to be borne without strain and to furnish a method to fall back on in case of imminent disaster, and also to teach that the best time to operate for cataract is before blindness and senility have set in The rule he adopts is to operate when the patient can no longer read newspaper print with his best glasses in ordinary light

Simple Method of Recording Automatically Gas Produced by Bacteria in Culture and of Oxygen Absorbed by Aerobic Non Gas Forming Bacteria A Fleming and F J Clemenger—p 66
Litmus Solution Suitable for Bacteriologic Purposes J McIntosh—p 70

Is Hemolyzed Blood Toxic?—No evidence was obtained by Bayliss that hemoglobin or any other product of hemolysis is toxic If the blood pressure is low the renal secretion may be reduced but it can be restored by injection of gum saline Hemoglobin in solution serves as a carrier of oxygen When hemolysis is produced by transfusion of incompatible blood the serious results are not to be ascribed to the hemolysis as such but probably to some effect of foreign protein allied to anaphylaxis Rabbits are not to be used for experiments of the kind described because of their frequent death by intravascular clotting and the irregularity of this reaction

Experimentally Produced Fever or Heat Stroke—A short but virulent fever can be produced by the subcutaneous injection of B-tetra-hydronaphthylamin The temperature rises within one hour of the injection and the animal dies in hyperpyrexia with convulsions and deeply congested lungs The dose necessary to produce this effect depends on the climatic conditions under which the animal is kept Thus a dose which will kill a mouse in a warm room will have no effect in a cold room Again a small dose which has little effect even in a warm room will produce a fatal pyrexia if ten or twelve animals are crowded together in the cage It is argued by Cramer that this is an experimental "heat-stroke comparable to that in man—namely, a deficient cooling due to the environment acting on an organism which is under the influence of a hyperactive nervous system. In the treatment of heat stroke the importance of drastic cooling is emphasized Chloral and anesthetics are suggested as accessory aids to treatment Morphin aggravates the condition

Classification of Meningococci—A polyvalent meningococcus serum was absorbed with a number of strains of meningococci and then its agglutinating action was tested by Fildes on all of these strains The strains were then classified according to the effect they had on the one serum This is considered more satisfactory than classification by means of monovalent serums It was found that the cocci could be divided into two distinct groups and that each group was further divisible in two subgroups All cocci in the main groups displayed the characters of each of the subgroups to a greater or less extent A selection of standards for closely defining subgroup characters is an arbitrary proceeding and may lead to confusion if one and the same strain is not maintained as standard The use of monovalent serums will fail to reveal certain cocci as meningococci

Proteinuria Not Sign of Defective Kidney—The question of albuminuria is discussed by Maclean and Wesselow and evidence brought forward to show that the presence of protein in the urine is more common than is generally supposed Proteinuria by no means shows that the kidneys are defective in function and its significance as an indication of renal disease can only be ascertained when other efficiency tests are used as well In severe cases of interstitial nephritis the best indication of the extent of kidney damage is obtained by an estimation of the blood urea In normal individuals this should lie between 15 and 50 mg per hundred cubic centimeters of blood while in severe cases of nephritis it may rise as high as 200 to 300 mg per hundred cubic centimeters or even more The inability of the diseased kidney to excrete urea at a high concentration is utilized as a new test of kidney efficiency The patient empties the bladder and then swallows 15 gm of urea dissolved in water One and two hours afterward he passes water and these samples are tested for concentration of urea The test is a better indication of renal efficiency than others now in use An investigation on Ambard's coefficient showed that this test is of value only in bad cases where there is a definite accumulation of urea in the blood it has no advantages over a simple blood urea estimation A short scheme of the method now used by the Ministry of Pensions for the investigation of renal cases is given

*New Medium for Growth of B Influenza P Fildes—p 129

Value of Colloidal Gold Test.—The results of other workers regarding the value of the colloidal gold test in the diagnosis of general paralysis are confirmed by Cruickshank. The substance in the spinal fluid of general paralytics which causes precipitation of colloidal gold is not dialyzable and resides in the globulin fraction of the protein and in this respect resembles the Wassermann reacting substance It is not altered by heating to the coagulation point of protein The reaction is not due to peptone The various types of reaction can be simulated by mixtures of globulin and albumin, the globulin acting as a precipitating agent and the albumin as an inhibitory or protective one Syphilitic reactions are due to an amount of albumin sufficient to obscure partially the precipitating effect of the globulin As the globulins obtained from negative spinal fluids even when used in concentrated form, are almost inactive the precipitating action of paretic fluids cannot be ascribed solely to the increase in globulin, but is probably dependent on a specific alteration of the physical state of the globulin, which is associated with a positive electric charge Human serum globulin has the characters of a positive colloid but the paretic and syphilitic reactions of spinal fluids cannot be attributed merely to the passage of serum globulin into the spinal fluid The meningitic reactions, on the other hand may be due to the leakage of plasma through damaged meninges

Experimental Lethargic Encephalitis—McIntosh and Turnbull describe the reproduction of lethargic encephalitis in a Pafas monkey by combined intraperitoneal inoculation of filtered emulsion of cervical cord, pons and basal nuclei obtained from a fatal case On the sixth and forty-eighth days after inoculation the monkey had fits after the second fit it was lethargic rigid and trembling until death on the fifty-sixth day Macroscopic and microscopic examination revealed no lesions in the viscera An extensive microscopic examination of the central nervous system revealed engorgement hyalin thrombosis a very few hemorrhages into "perivascular canals edema of certain cranial nuclei extensive degeneration of bodies of neurons and an inflammatory infiltration confined to the posterior part of the left basal ganglia, focal areas of the cerebral pia and the wall of a vessel in the right trapezoid body In its strict localization its situation its distribution in the affected areas and in its cytology the infiltration resembled closely that in human cases A description is also given of the ambiguous result of similar inoculation of the emulsion unfiltered into a Macacus monkey

Stain for Capsule of Bacteria—A film of the bacterium preferably in suspension from agar is dried on a slide and a film of India ink superimposed The slide is then stained with hot gentian violet followed by iodin The bacteria are blue-black the capsule is colorless against the ink background

Medium for Growing Influenza Bacillus—A peptic digest of blood is neutralized and added to agar or broth The advantages are that initial materials need not be sterile it is rapidly prepared, has constant value, remains unchanged indefinitely giant growth An accurate adjustment of the reaction of the blood is essential

*Method of Treating Hay Fever and Paroxysmal Rhinorrhoea—M. Agar—p. 125

Surgery of Gastric Ulcer—In 835 operations performed by Moynihan on 834 patients there were twelve deaths—a total mortality of 1.43 per cent. Excluding the cases of jejunal ulcer, 808 operations were done for gastric and duodenal ulcers with ten deaths—a mortality of 1.23 per cent. Posterior gastro-enterostomy was done most often, 660 times, with gastrectomy next in eighty cases. Excision of the ulcer was done forty-two times.

Silver Nitrate Applications in Hay-Fever—The method employed by Agar consists essentially in treating the vestibule of the nose with an astringent lotion, silver nitrate 30 grains to the ounce. The rubbing is carried out thoroughly and systematically, particular attention is paid to two spots, the first is high up on the outer wall and the second is the floor, from half to three-quarters inch back from the orifice. No part of the vestibule must be missed and the nostril must be stretched to open up the folds. No application is made to the mucous membrane. All patients with nasal rhinorrhea treated by this method have been cured. Good results are obtained also with patients suffering from hay-fever. Some cases of asthma have also been treated but the results have been less satisfactory, although some improvement has been obtained.

Amylolytic Enzyme in Spinal Fluid—Saito found that the amylolytic power of the normal human cerebrospinal fluid is 0.001-0.004, while that of purulent cerebrospinal meningitis was not strong even if there were no remarkable changes in the fluid. The cerebrospinal fluid of tuberculous cerebrospinal meningitis possesses a remarkably increased amylolytic power. The fluid taken from a dead body had also a remarkably increased amylolytic power.

Pleural Obliteration a Complication of Artificial Pneumothorax—W. C. Rivers—p. 244
Vertigo: Its Relation to Errors of Refraction—C. E. Pronger—p. 245

Psychology of the Special Senses—Hurst concludes his Croonian lectures by stating that hysterical pain is a very real thing and cannot be distinguished from pain caused by organic disease by its character or by the absence of associated sympathetic phenomena. It may, for example, give rise to tachycardia, dilatation of the pupils, pallor, and sweating if the original organic pain did so because the afferent impulses excited by peripheral stimuli that the latter still produce marked effects, even if they are so slight that if the patient would cease to expect pain and so allow the normal resistance to return, they would either produce no effect at all or only an insignificant amount of pain and little or no sympathetic reflexes.

Classification of Pulmonary Tuberculosis—The classification Burrell suggests is based on the life history of the patient. The first stage A is subdivided into (1) the hospital stage, and (2) the sanatorium stage. The hospital stage includes patients in whom pulmonary tuberculosis has just been diagnosed and who require observation in hospital or in bed at home to enable the physician to determine the proper treatment and to see the patient's response to treatment. It may be regarded as the stage of initial rest. If the patient improves sufficiently to stand a sanatorium life he passes into the sanatorium stage. Here the patient remains until he reaches the stage of maximum improvement. He then passes into the second stage B. This includes all patients who, having received the maximum benefit from institutional treatment are holding their own but in whom the disease is not arrested. Stage 3 is the stage of decline and includes patients who are losing ground in spite of treatment. These stages are subdivided as follows. A. Stage of institutional treatment.—1. Hospital stage: a. In bed or up less than two hours a day. 2. Sanatorium stage.—a. Capable of less than half a day's work. b. Capable of half a day's work. 3. Capable of a full day's work. B. Stage of maximum improvement.—1. Capable of a full day's work. 2. Capable of part-time work. 3. Unable to work. C. Proof of decline.—1. Able to do some work. 2. Unable to work. 3. Bedridden.

Tetany and Administration of Alkalis—P. S. Henderson—p. 427
Adult Tetany and Methylguanidin—A. Methabolic Study—L. Findlay and J. S. Sharpe—p. 433

Beriberi—The results of Sprawson's observations are summarized as follows. The disease called beriberi is a syndrome which may arise from various causes under different circumstances. One class of case is not due to a food deficiency, but appears to result from an infection. Other cases are due to a vitamin deficiency in the food; this takes a few months to operate in a previously healthy subject and may be called primary beriberi. In yet another class the syndrome arises apparently from the effect of some depressing influence or secondary infection on a subject previously rendered susceptible to the disease. These cases may be considered to have been suffering from "latent beriberi." In all classes the clinical appearance is approximately the same there being differences only in the relative frequency of various manifestations in the three groups.

Rectal Absorption of Glucose—Experiments were made by Tallerman to detect any absorption of sugar administered per rectum taking place by an analysis of the blood a direct measurement in the rise of blood sugar being made after an injection of glucose by rectum. Solid glucose 60 gm. was dissolved and made up to about 180 c.c. with physiologic sodium chlorid solution. This was injected slowly into the rectum in the same manner as that used in ordinary rectal feeding. About ten minutes were taken over this injection, it was given in a single dose. He found that absorption does take place, the maximum being usually attained in about 1.20, the average rise at this being 0.03 per cent. With the exception of two cases the glucose was well retained and no ill effects resulted; there is therefore no reason to suppose that the high concentration of glucose used had an irritating or inhibitory effect on the gut but at the same time the concentration is probably a factor in the question of absorption.

Heart Disturbances in Rheumatism—Information was collected by Parkinson and others on the nature, incidence, and

significance of the acute disturbances in the myocardium observed during the course of a consecutive series of fifty cases of acute rheumatism In thirty-five cases the apex beat was palpable, and the heart increased in size in ten, decreased in ten increased ten decreased in three, and remained unchanged in twelve No definite relationship was found between the development of systolic murmurs at the apex and apparent enlargement of the heart Sinus arrhythmia was present after the attack in forty-seven of the fifty cases The authors conclude that the presence of sinus arrhythmia does not indicate that the heart has escaped infection Premature auricular contractions appeared in seven cases (14 per cent) Acute heart-block (a-v) developed in fifteen of the fifty cases proceeding to the degree of dropped beats in four (8 per cent) It often appeared quietly in the absence of other signs such as pyrexia and tachycardia, and it invariably disappeared during convalescence The general conclusions are that acute heart-block of some grade is common in acute rheumatism, that it indicates acute myocarditis, and that it may, therefore be premonitory of chronic myocarditis and eventual heart failure

*Painful Dilatation of Right Colon R Gregoire—p 456
*Paroxysmal Pain in Solar Plexus F Moutier—p 471
*Pathogenesis of Gastric and Duodenal Ulcer R Dahl—p 483

Painful Dilatation of Right Colon—Gregoire declares that dilatation of the colon induces pain liable to be mistaken for appendicitis although there is no specially tender point, the whole flank is painful The ptosis and movability may kink the bowel, and he is convinced that many severe disturbances in adults are traceable to ptosis of the colon in childhood which might have been easily remedied then The only appreciable manifestation of the ptosis is the dilatation and pain He reports five cases in children, from 12 to 16 years old, in which colopexy put an end to all disturbances He fastened the ascending colon to the posterior wall of the flank and the middle portion of the transverse colon to the abdominal wall The mesentery is usually abnormally long or not properly fastened Some of these patients get relief by reclining with the pelvis higher than the head, the colon thus sliding back into place The tissues are usually strong and the colopexy holds in the young

Physostigmin in Treatment of Abdominal Pain—Moutier advocates eserin (physostigmin) in treatment of sympathetic abdominal pain and vasomotor phenomena, with accessory secretory phenomena, independent of any organic lesion in stomach or intestines They are most common in persons with the ordinary symptomatic triad of neurasthenia, inanition and ptoses, but they may be encountered likewise with ulcer or colitis mitral stenosis or hyperthyroidism Atheroma of the aorta, and tumors interfering with the circulation in the abdomen may also be factors in these sympathetic paroxysms The pain and the pulsation in the aorta visible in the epigastrium, distinguish these solar crises In treatment he has found eserin most effectual giving 30 drops in the twenty-four hours, fractioned before meals of a mixture of 0 01 gm neutral physostigmin salicylate with 3 5 c c glycerin and 1 5 c c of distilled water to which alcohol is added Q S to 10 c c He begins with 10 drops and gradually increases to 60 drops and then reduces in the same way He never went above 60 drops The best results may be anticipated with sympathicotonia as was evident in nine cases he reports, in four others atropin proved more effectual

Salts of Cerium Earths in Experimental Tuberculosis—Frouin reports further experiments with intraperitoneal injection of sulphates of the cerium earths in fifty rabbits and thirty guinea-pigs after they had been inoculated with bovine tuberculosis The final outcome confirms, he says, what might be expected considering the inhibiting influence of these salts on cultures of tubercle bacilli and the reduction of the fat and wax content of the bacilli cultivated in the presence of these salts The animals injected developed sclerosis in the organs presenting signs of tuberculosis, and, with a few exceptions survived from two to five months longer than the controls In the rabbits, the tuberculous lesions in the lungs after inoculation in the ear remained restricted to the lungs In conclusion he states that the experimental data recorded explain the clinical results realized by Grenet and Drouin (mentioned in these columns July 24 1920, p 246 and 276)

Chronic Silver Intoxication—In the case of argyria reported, silver nitrate pills had been taken internally for tabes, a daily dose of 0 01 gm for ten years The tabes had developed unmodified, but aside from the indelible pigmentation of the derma, there did not seem to be any symptoms from the argyria

Ether in Treatment of Whooping Cough—Audrain gives an intramuscular injection of 1 c c of ether in treatment of whooping cough in infants, and 2 c c in older children, on alternate days and has always found it successful in arresting the disease except when adenoids are a factor in the spasmodic coughing In the discussion that followed, Dalche reported the attenuation of whooping cough in a young woman under three injections of ether but Courcoux reported a negative case in an infant of 2 months and Variot two negative cases in young children but the latter added two more positive cases to the list, the effect being a complete cure after four or five injections Audrain ascribes its action to its disinfecting properties

Epinephrin by the Rectum—Lesne cites research which has shown that rabbits can bear twice the fatal dose of epinephrin if it is injected directly into the stomach or small intestine but injected into the rectum the toxic action seems to approximate that with subcutaneous injection Neither pepsin nor pancreatin modifies epinephrin in the test tube, but the liver neutralizes its toxic action The liver barrier seems to arrest the epinephrin ingested while, given by the rectum thanks to the wealth of anastomoses of the hemorrhoidal veins it can pass directly to the vena cava system Hence he advises to give epinephrin by the rectum rather than by the mouth as the effect will be much greater and with a smaller dose

Emetin in Asthmatiform Attacks—In the two cases described by Le Clerc, pulmonary emphysema was responsible for the attacks resembling asthma in the boys of 10 and 14 He arrested the distressing attack with tartar emetic and then continued treatment with injections of from 0 02 to 0 04 gm of emetin daily for five days then suspension for five or ten days and then recommencing The mother continued to give the injections to the younger boy whenever there were symptoms of return of respiratory disturbance but after eighteen months it was never needed When last seen nearly three years later the child apparently entirely outgrown the tender [illegible] con-

parable to that recommended by Ramond in chronic bronchitis

Diabetic Epilepsy — Guillain reports a case of epileptic seizures developing for the first time in a soldier in the course of acute diabetes The seizures subsided under treatment of the diabetic acidosis, and with them the left hemiplegia which had developed at the same time In Labbe's four similar cases, the connection between the grave diabetic acidosis and the seizures was equally evident

Pernicious Anemia in Tuberculosis —Pissavy remarks that the case he reports differs from the few others on record in that the pernicious anemia was caused by tuberculosis of the mediastinal and mesenteric glands, the lungs being scarcely touched

The Schick Diphtherin Reaction in Contagious Diseases — Renault and Levy applied the Schick test to forty-two children with measles and forty-five with scarlet fever or other contagious disease, and found that secondary diphtheria could be foretold with certainty when the reaction was positive, with virulent diphtheria bacilli present in the environment, and the rhinopharyngeal mucosa inflamed, as is the rule in the eruptive diseases Secondary diphtheria does not develop if one member of this trio is lacking They expatiate on the useful information to be derived from the Schick reaction in connection with the clinical and bacteriologic findings

Electric Chorea —Achard and Ramond say that lethargic encephalitis has thrown light on the etiology of chorea It is probably responsible for certain cases of choreiform myoclonias and of acute chorea Dubini's electric chorea is probably identical with it but there is another form of electric chorea, the Henoch-Bergeron type, which differs completely from it, as they prove by the history of a case in 1904 It is mild and is cured by suggestion or tartar emetic, but it occurs in epidemic form Of Bergeron's seven cases, three were encountered in one week

Pulsus Alternans —Lian and Boulot noted pulsus alternans in ten of sixty persons with high blood pressure in a recent four month period In eight of the ten cases the alternans was not pronounced, but even in this form it is readily recognized when the sphygmomanometer cuff is inflated with a pressure equal to that of the maximal arterial pressure

Hermaphrodism in Man and Mammals A Lacassagne —p 273

Antityphoid Vaccination in the Pregnant — The experimental and clinical experiences related show that the pregnancy progresses the same in the vaccinated as in the non-vaccinated, and the fetus shows no injurious influence from the vaccination even during the last half of the pregnancy The fetal serum acquires agglutinating power although the placenta seems to interpose a barrier, the barrier yields more readily, the larger the amount of vaccine used

Tubo-Ovarian Varicocele —The varicocele can be differentiated by the appearance and disappearance of the tumor palpated according as the patient stands sits or reclines

Hysterectomy Both Total and Subtotal —De Rouville combines the advantages of both the total and subtotal technics by leaving the cervix but at the same time scooping it out to leave merely an empty shell Hemostasis is ensured by low ligation of both uterine arteries above the point where the vaginal branch diverges

*Circular Suture of Brachial Artery M Roussiel —p 18
*Pseudarthrosis of the Leg C Dujarier —p 31
Diaphragmatic Hernias L Prat —p 43

Suboccipital Pott's Disease in Adults —Tuffier has applied the Albee technic in seventeen cases of this kind Necropsy eight months later in one woman showed that the bone insert had slipped to one side where it was held quite firm with fibrous bands This shows the importance of preparing the bed for the implant so that it cannot possibly slip out, and he advises making the bed amply long enough, down to the seventh cervical vertebra

Circular Suture of Brachial Artery —Roussiel adds three personal cases to the seven he has found on record The operation failed in only three and this was on account of the extent of the war wound

Pseudarthrosis of the Leg —The pseudarthrosis was in the leg in twenty-four of Dujarier's total 130 cases He operated by the Albee technic and fracture occurred in the bone transplant in three cases This warns he says that some support had better be worn for a year at least Consolidation was complete in *four to four months in 90 per cent of the* leg cases but in one case in which the leg had not been immobilized the patient being kept merely in bed, there was no trace of consolidation in two months and a further operation was necessary

Roentgen-Ray Treatment of Uterine Fibromyomas — Beclere's work in this line has been repeatedly mentioned in these columns He has applied this treatment in well over 400 cases preferring mild weekly doses of about 3 H units never over 3½ and postponing the sitting if the skin shows the slightest trace of inflammatory reaction

Roentgen-Ray Treatment of Hypertrophied Prostate — Haret insists that when there is merely glandular hypertrophy radiotherapy is logical and may rapidly reduce the size of the gland but when there is hyperplasia of connective tissue radiotherapy is not of much benefit He gives the details of eleven typical cases remarking that as the patients stop coming when they are relieved complete return to normal size is seldom realized

*Fistula into the Colon Guilleminet and Guerin—p 232
*Evolution of Wounds of Vessels R Leriche and A Policard—p 242
*Ligation of Brachial Artery R Leriche and A Policard—p 250

Fixation of Sacro-Iliac Joint—Hertz gives an illustrated description of a method of driving a bone peg into this articulation which immobilizes it completely and stimulates osteogenetic power He has recently applied it in three cases for suppurating sacrocoxalgia, and in a fourth case after the suppuration had subsided The bone insert healed in place without the least drawback, and experiments on the cadaver confirmed the solid fixation that can be realized by this means

Drainage of Purulent Pericarditis—Durand and Wertheimer report prompt and complete cure of a streptococcus infected hemopericardium after a stab wound treated by incision and drainage through the space left by resection of the seventh costal cartilage and lower portion of the sternum

Epigastric Hernia—Barthelemy noted in his thirteen cases of epigastric hernia that the round ligament was frequently adherent to the opening, traction from this was responsible for the symptoms common with this form of hernia

Bone Growth with Cartilage Graft—Policard and Murard report a case and cite others on record in which a cartilage implant led to actual bone production in the adjacent connective tissue, a lump of bone forming

Fistula Into the Colon—Guilleminet advocates direct resection of the parts involved in a large suppurating fistula, without wasting time on preliminary measures to divert the course of the feces

Traumatic Lesions of Vessels—Leriche and Policard discuss the physiologic factors involved in the arrest of hemorrhage in an injured vessel and in secondary ulceration of the vessel They ascribe the latter to changes induced by the proteolytic substances secreted by the leukocytes attracted to the spot The microscope may reveal a scrap of thread or of the clothing in the vessel wall

Ligation of Brachial Artery—Among the practical conclusions of this analysis of the results after high ligation of the brachial artery are that the artery should be ligated in the lower third also, just above the branching of the inferior internal collateral Otherwise this collects and wastes blood in a useless blind pouch But ligation of the brachial artery should be avoided whenever possible, it is dangerous here The artery should be sutured instead of ligated Suture is not necessary, however, for lesions lower down, ligation here does not interfere with the nourishment of the arm in the same way

Scurvy in Infants G L Hallez—p 623
*Insufficiency of the Liver P Brodin—p 625
Constipation G Vitry—p 629

Diseases of Deranged Digestion and Nutrition—Lortat-Jacob reviews the progress of the last six years in this line It is mainly in our better knowledge of the vitamins, of amebiasis, spirochetal jaundice and diabetes insipidus war skull wounds having cleared up much of the obscurity in regard to nervous polyuria Improvement has been realized in some cases of pituitary diabetes by pituitary treatment but the improvement was transient He adds that the more common use of the duodenal tube is further progress as this throws light on conditions in that important crossroads in the body He refers to the large number of cases of amebic dysentery in France, an aftermath of the war, and recalls that diarrhea is not a feature of dysentery, constipation is the rule Like other protozoal diseases malaria and syphilis, it may require treatment for months and years An amebic abscess in the liver may develop insidiously, the rapid loss of flesh and a diffuse ache in the enlarged liver almost the only signs The onset of spirochetal jaundice is frequently accompanied with diffuse and sometimes intense muscular pains and a meningeal reaction Contagion may occur during the weeks following the convalescence, the urine containing at times large swarms of spirochetes

Dietetic Factors in Diabetic Acidosis—Labbe relates that, in his tests the acetonuria declined in diabetics fed with abundance of butter while it increased when the diet contained much meat Butter, olive oil and cream have serious advantages in the diet in acidosis, up to 100 gm of butter can be given to a *diabetique acidosique* without harm Oatmeal days, etc, owe their usefulness to the lack of proteins especially of meat protein The albuminoids of meat, he continues consist mainly of ketogenous amino-acids, while those of vegetables contain much less of these Hence he advocates legumes as contributing to maintain the nitrogen balance without the ketogenous amino-acids It is possible that diacetic acid and oxybutyric acid are not so important from the pathogenic standpoint as we have been assuming They reveal the acidosis but other products may be primarily responsible for it This assumption is sustained by the disturbance in protein metabolism and the considerable quantities of amino acids and of residual nitrogen eliminated by diabetics with nitrogen denutrition

The Blood Sugar in Diabetics—Rathery reiterates that repeated determination of the sugar content of the blood is important both for the prognosis and the treatment The variation in the glycemia, determined before and after ingestion of a test amount of glucose and the fluctuation of the glucose threshold, are extremely instructive When the threshold fluctuates readily, the glycosuria can usually be kept under control by dieting, otherwise not

The Fasting Stomach Content—Carnot gives the interpretations of the findings liable to be encountered when the content of the fasting stomach is examined

Nervous Anorexia—Surmont appeals to the general practitioner to be on the lookout for nervous anorexia lacking proper treatment it may entail serious disturbances This usually monosymptomatic neurosis is encountered at all ages even in infants and in the aged, in both sexes, and in all classes of society It is frequently liable to be mistaken for cancer pernicious anemia, diabetes, suprarenal insufficiency or pulmonary tuberculosis

Pancreas Dyspepsia—Cade emphasizes that while the diagnosis of pancreas dyspepsia is based on analysis of the stools negative findings do not exclude it

Acute Angiocholitis and Infectious Jaundice—Garnier and Reilly comment on these two distinct chapters of the pathology of the liver although they may be associated Most of the micro organisms capable of generating the infectious jaundice do not thrive in bile, the icterohemorrhagic spirochete and the pneumococcus are killed by addition of 1 per cent bile to their cultures The streptococcus seems to be the only exception Even the typhoid group are seldom involved They encountered only four cases in which typhoid or paratyphoid bacilli seemed to be responsible for the infectious jaundice in a total of 1 300 cases of the latter during a recent three year period It is usually a secondary invasion

Jaundice—In referring to spirochetal jaundice Villaret says that treatment is mainly symptomatic, diuretics (lactose drinks hexamethylenamin) baths to reduce fever, and venesection with uremic symptoms Cases have been observed recently at Paris The jaundice which occurs after arsphenamin treatment is usually mild, and does not always require suspension of the drug but we must be on the watch for it and direct treatment according as the jaundice is due to superposed infection flaring up of the syphilis or too intensive treatment

Insufficiency of the Liver—Brodin explains that the liver frequently suffers in the course of infectious diseases although not to a degree that entails jaundice This insufficiency can be remedied, he asserts, by giving an extract of the whole liver This, in powder form, is preferable to preparations of bile as the latter are liable to entail enteritis

May 1920 **8**, No 3

*Ordinary Diarrhea in Infants Fed on Cow's Milk A B Marfan—p 129
*Syphilitic Jaundice in Infants G Blechmann—p 145
*Anemia with Splenomegaly in Infants G L Hallez—p 154

Treatment of Diarrhea in Infants Fed on Cow's Milk—Marfan gives minute directions but emphasizes that rules must not be too absolute in dietetic treatment of infants, the directing principles must be adapted to each individual case Restriction to water for one or two days and gradual resumption of the feeding are the main points never forgetting that fluids must be supplied to the amounts the child was taking daily in health, that is about 125 gm per kilogram of weight for infants less than a year old and above this a liter at least Buttermilk made for medicinal use as he describes effectually combats diarrhea The fresh milk is sown with a little sour milk from the day before and set aside for twenty-four hours, then skimmed churned for forty minutes, passed through a fine sieve, 30 gm of sugar per liter are added, and 10 gm, about a tablespoonful, of rice gruel (creme de riz) and a pinch of salt, and the whole slowly heated to boiling point, taking twenty or twenty-five minutes stirring constantly with a cream whip

Syphilitic Jaundice in Young Children—Blechmann presents evidence that inherited syphilis is often responsible for different forms of jaundice in infants which have hitherto been ascribed to other causes or even regarded as physiologic Early rachitis affecting predominantly the skull is strongly suggestive of inherited syphilis as also early adenoids, early enlargement of the spleen and bilateral enlargement of an epitrochlear gland Congenital strabismus if convergent, and early convulsions are also suggestive The frequent cure of habitual vomiting of breast-fed infants under mercury lactate is further illuminating, and intracranial hemorrhages during delivery suggest a special vulnerability of the cerebral vessels for which syphilis may be responsible In any event he concludes, jaundice calls for scrupulous investigation and if other signs of syphilis can be detected he advises intravenous injection of arsenical salts, possibly by the jugular or epicranial veins

Splenomegaly with Anemia in Infants—Hallez' study of pseudoleukemic splenomegaly is accompanied by reports of two grave cases

*Auscultation of Arteries L Gallavardin and L Tixier—p 25
Diagnosis of Tricuspid Insufficiency P Ribierre—p 31

Recent Progress in Cardiology—Lereboullet and Heitz say in this annual review of progress in diseases of the heart and vessels that the Pachon oscillometer has won an important place not only in general practice but in neurologic and psychiatric investigation and in the operating room and maternity It reveals the apparent death of the newly born, and allows estimation of the heart action of the parturient It shows not only the maximal and minimal blood pressure but also the condition of the peripheral circulation and the relative vasoconstriction of different arteries and throws light on their anatomic state They cite further the occasional regulation of irregular heart action by quinin One case has been reported in which auricular fibrillation yielded to quinin but in some other cases the results were negative Clerc and Pezzi have recently reported that quinin has a tendency to slow and depress the myocardium and the blood pressure, and thus is a true antagonist to epinephrin They warn further that with asystole the Ambard ureosecretory constant must be interpreted with reservations

Auscultation of Arteries—Gallavardin and Tixier apply auscultation to determine the ascending phase of the arterial pulse and describe how it is possible to detect the gaps caused by aortic stenosis thus adding another peripheral sign to the semeiology of aortic stenosis

*Asthma in Infants A B Marfan—p 481
*Physiologic Sosias in Human Pathology H Frenkel—p 483
Application of Tincture of Iodin to the Eye L Chemisse—p 486

Asthma in Infants—Marfan describes a typical case in an infant of 8 months with diffuse bronchitis Small doses of potassium iodid kept up for months or years have proved useful to ward off the tendency, but for the attack itself subcutaneous injection of epinephrin in artificial serum, once or twice a day has been remarkably effectual in his hands on several occasions The dyspnea can be combated with a mixture of equal parts of syrup of codein and syrup of ether, a teaspoonful three or four times a day, and burning an antiasthma powder in the room (The syrup of codein of the French Codex contains 0 2 per cent codein while the syrup of ether contains 2 per cent ether)

Physiologic Doubles in Human Pathology—Frenkel uses and defines the term 'sosie" as a "person who has a striking resemblance to another' and applies it to a series of physiologic conditions the exaggeration or transformation of which would constitute a morbid entity and also to a series of physiologic conditions which have merely a superficial resemblance to certain pathologic conditions He reviews the field of both types

Pneumococcus Thyroiditis and Prevesical Abscess Kummer—p 362
Ingestion of Gram of Cocain Bonjour—p 368
Historical Instances of Sudden Blanching of Hair C G Cumston—p 384

Tuberculin Treatment.—Jaquerod recalls that immunization to a certain extent against tuberculosis can be obtained naturally and artificially and hence vaccination of man is no idle dream To date it has not been fully realized but tuberculin treatment reenforces the resisting powers and usually, in the course of months slight improvement may be counted on if the forces of the organism are still capable of opposing resistance to the infection The tuberculin is merely an adjuvant but his fifteen years of experience with it have demonstrated its efficacy in many cases He warns that in tuberculosis every physical trauma no matter how insignificant, augments the virulence of the bacilli and reduces the resistance of the cells in the foci He reiterates that repose is indispensable in treatment of the tuberculous They must avoid all work, all sports and everything that induces fatigue Tuberculin must never be given in amounts large enough to induce an appreciable reaction in the focus It probably always acts on the focus but this action must never be pronounced enough to be clinically apparent The diagnostic importance of tuberculin is sustained anew by his three cases in which supposedly healthy persons gave a positive ophthalmoreaction but, as they never showed any signs of tuberculosis, no attention was paid to the findings of the test until three years, six and eight years later extremely severe tuberculosis became manifest He adds that it would be absurd to treat for tuberculosis every one giving a positive skin or intradermal test but that this should be the rule when tuberculin tests elicit exaggerated positive responses

Occupational Phosgen Poisoning—Gerber's patient was a manufacturing chemist, with two men he was experimenting with phosgen passing it through alcohol Each felt some irritation after several hours' work but the two men soon threw off the conjunctivitis and cough The other after four hours of slight symptoms showed signs of pulmonary asphyxia progressing to a fatal termination the twenty-fourth hour

*Operative Treatment of Gastric Ulcer D Giorgacopulo —p 187

Acute Postoperative Dilatation of the Stomach—Among the various causes to which this postoperative complication has been ascribed, Gilberti cites suprarenal insufficiency and reports a case in which the transient benefit from epinephrin and the cheesy process discovered in the suprarenals at necropsy seemed to point to this etiology He agrees with those who regard acute hyposuprarenalism or the flaring up of the chronic as the common basis for the postoperative disturbances credited to the anesthetic, or to infection or irritation of the peritoneum or sympathetic system The practical conclusion is that epinephrin is called for in all postoperative complications except those from mechanical traction

Gastro-Enterostomy Versus Resection for Gastric Ulcer—After long discussion of this subject the author's verdict is that resection is undoubtedly the operation of the future Its only disadvantage is the high mortality, and time is constantly reducing this

Double Acquired Athetosis.—Todde reports the case of a young woman who developed athetosis accompanied by pain in the lumbar region and contractures interfering with swallowing chewing and speaking The extremely severe condition has persisted almost stationary during three years to date The constant incoordinated involuntary movements subside somewhat in repose and almost entirely during sleep To control the tendency for the head and shoulder to jerk backward the young woman sits and stands with her back against the wall or other support By exclusion, Todde accepts some lesion in the cortex complicated with chronic changes in the spinal cord and nerves This would explain the exaggerated knee-jerk Babinski sign neuralgic pains, trophic changes in certain muscles paresis of the extensor muscles of fingers and toes and the muscular spasms The inability to speak distinctly is evidently due to contracture of the muscles involved

Differentiation of Mastoiditis and Pott's Disease—Molinari emphasizes the occasional difficulty in distinguishing between suppuration in the mastoid and a tuberculous process in the vertebrae below while opposite treatment is required for the two Roentgen-ray findings may be the only instructive guide

Spleen in Right Iliac Fossa—Razetti found that the supposed ovarian tumor in the right iliac fossa was the spleen with a twisted pedicle more than 20 cm long He says it is the first case of the kind in Venezuela and the first splenectomy

Surgery of the Stomach—Razetti concludes this lecture with an appeal to physicians not to wait for more than one two or three months in cases of gastric or duodenal ulcer if no improvement is manifest under medical measures but call in the surgeon at once

Neuro-Amebiasis—Salom emphasizes the importance of differentiation of neuritis for which amebic dysentery is responsible Emetin offers a prospect of cure except in the fulminating form in which a fatal termination is the rule unless the heart can be sustained and respiration maintained with amyl nitrite and similar measures until the effect of the emetin becomes apparent

Beriberi—Salom remarks that beriberi is one of the great scourges of his state, Bolivar in Venezuela A change of climate should be advised in every case of beriberi even if the change is only to a short distance Moderate exercise on foot and a nutritious diet should be ordered, with nerve tonics, diuretics if there is a tendency to edema, and tonics for the heart and respiratory apparatus The paralytic and edematous forms get well with mere change of climate, but the fulminating cases are usually promptly fatal Beriberi patients should be kept apart from others

Heart Output per Beat G Wiedemann —p 243
Hygiene and Social Hygiene H Reiter —p 243
Dermatologic Hints for General Practitioner M Joseph —p 244

Acute Yellow Atrophy of the Liver—Fraenkel had lately the opportunity of examining directly the liver of two living subjects while suffering from acute yellow atrophy, and he agrees with Umber to the extent that the acutely atrophic living liver differs in its macroscopic appearance from the acute atrophic liver of the cadaver but his findings do not confirm the conclusions reached by Umber in regard to a postmortem autolytic product In Umber's case the patient recovered so he was not in a position to compare his intravital with postmortem findings, whereas in Fraenkel's cases the patients died, so that a direct comparison of vital and postmortem conditions in the liver was possible He adds that more or less ascites was found in over 20 per cent of thirty-three cases of acute yellow atrophy of the liver he has encountered

Estimation by the Plethysmograph of the Effect of Drugs in Heart Disease—Weber and Sperling state that it is not only the cumulative effect of cardiac remedies that may be injurious but that often the first dose exerts a harmful influence for which reason it is important to be able to test he effect of a drug on a patient by the plethysmograph right from the start While the arm is in the plethysmograph jar the foot is vigorously exercised The findings are thus reenforced and are instructively characteristic They add that a subcutaneous injection of 0 5 mg of atropin half an hour before giving the heart tonic sometimes rendered it possible for the first time for the drug to exert the desired action as the atropin reduced the hyperirritability of the vagi

Heart Findings in Experimental Illuminating-Gas Poisoning—Zondek found that in rabbits, illuminating gas produced a dilatation analogous to that observed in man, the auricles especially were affected, and the condition persisted from twenty to thirty hours No anatomic changes of the heart muscle were noted In cats in which the heart muscle is more strongly developed, the dilatation was not observable, which furnishes experimental proof of the role played by the organic predisposition of the heart

Clinical Aids in Diseases of the Intestine—Ganter and van der Reis describe two capsules to be swallowed, and then opened by the action of a magnet from without With one it is possible to take from any part of the intestine material for examination and, with the other to pour out the solution of a drug at any point of the intestinal canal, for local treatment

*Ascaris Ileus Rost —p 251
*Traumatic Origin of Sarcoma K W Funke —p 262
Aneurysm of Renal Artery O Orth —p 272

Operative Correction of Drop-Foot—Klapp gives an illustrated description of a case in which he restored functional use of the foot by arthrodesis The foot was slit horizontally from end to end through soft parts and bones into the tibiotarsal joint, thus turning back a tongue-shaped flap comprising nearly the entire dorsum The dorsum flap did not fit into place as the foot was brought up to a right angle as this shortened the expanse The end of the flap was cut off to fit to the raw surface, and it was fastened with periosteum and periosteum tendon sutures The patient was a girl of 17 and the paralysis dated from a febrile disease at the age of 7 The foot after the operation was placed in a cast Morphin was required for the severe pain at first but in three months the girl was walking on the foot which had consolidated with solid arthrodesis Klapp ascribes the success of the intervention mainly to the displacement of the tops of the numerous bones and joints bringing sawed joints in contact with raw bone surface The tops of all the metatarsal joints had been included in the flap Kirschner has recently reported a similar operation to gain access to all parts of a diseased foot

Sensibility of Stomach and Intestines—Meyer experimented on twenty-six cats and states that the walls of the stomach and intestines and the serosa covering them did not display the slightest sensibility to adequate stimuli but traction or manipulation of the mesentery always elicited responses showing sensibility

Stretching the Soft Parts with Plastic Operations—Meyer and Struckmann comment on the large amount of skin and soft parts that can be loosened and drawn up from below for reconstruction of the chin and lips and be held there by traction applied long enough To ensure this they run two skewers from side to side through the skin of the chin the ends of the skewers fastened parallel in a frame The traction on the frame is by means of threads fastened to a long spring projecting from a headpiece

Malformation of the Hand—Paul theorizes to explain the causes of the malformation of the wrist with a four-fingered hand

Actinomycosis of Central Nervous System.—Geymüller reports from Basel a case in which the diagnosis of a tuberculous process in the atlas was corrected to actinomycosis by puncture of a swelling in the neck, disclosing actinomyces Similar cases on record are compared with this As the lesions are multiple, surgical measures are of little use

Ascaris Ileus—Rost had occasion to operate last year in five cases of abscesses in the bile apparatus caused by

ascarides, and in five cases of ascaris ileus In two of the latter there was no mechanical obstruction in the bowel, and he was able by experiments on animals to determine that total extracts of ascarides bodies exaggerate the tonus of the bowel of warm-blooded animals, while an extract of the skin of the helminths has the opposite effect This throws light on the spastic conditions found with clinical ascaris ileus, the spasm of the bowel is strictly localized in one loop as a rule All his patients with ascaris ileus complained of violent abdominal pains The tonus-reducing property of the ascaris skin may be responsible for certain functional disturbances in subjects with helminths, possibly contributing to clumping of the helminths

Traumatic Sarcoma—Eunike reports six cases of sarcoma developing at the seat of a trauma, in four it was an occupational injury The importance of the trauma as a factor was unmistakable, but the rarity of the development of malignant disease after a trauma shows that other factors are indispensable

Premature Separation of Normally Located Placenta F Lieven—p 377
Forceps Delivery and Viability of the Child A Mayer—p 389
Radiotherapy in 1919 H Wintz—p 415 Concn Summarized p 514

Transverse Stenosis of Vagina—Peters suggests that an obstructing transverse membrane may yield at childbirth and escape detection but in some cases laceration induces severe hemorrhage Neugebauer compiled 1,000 cases of the kind, with delivery by the natural route in 245 but the mortality in this group was 10 55 per cent The laceration may extend into the wall of the vagina and increase the danger of infection Peters recommends excision with suture and ligation of vessels, unless the membrane is thin and delicate but warns that the operation may entail further stenosis later The stenosis was evidently congenital in the six personal cases he reports

Premature Separation of the Placenta—Lieven attributes to pregnancy intoxication this serious complication In the sixteen cases at the Bonn clinic albumin was not evident in the urine except in one case Three of the women barely escaped with life from the severe hemorrhages, and one died as also 56 per cent of the children

Forceps and Fetal Mortality—Mayer analyzes the obstetric experiences at the Heidelberg maternity to decide whether forceps deliveries are responsible for deaths which might have been avoided by adopting other measures Forceps were applied in 1 35 per cent of 5 914 deliveries and 3.23 per cent of the children died during delivery or in twenty-four hours afterward, and 3 8 per cent were stillborn The statistics from twenty German maternities show that forceps were used in about 3 97 per cent of all the deliveries In compiling statistics he urges to omit from the calculations all the newborn less than 35 cm in length and weighing less than 1 500 gm, as these belong in a separate group

*Sulphosalicylic Acid Test for Albumin Schall—p 164
Taenia as Cause of Acute Appendicitis W Krieger—p 165

Irradiation of Superficial Cancers—Seitz and Wintz state that while it would seem that cutaneous and subcutaneous carcinomas ought to be easily cured because they are so easy to reach, such is not the case and give as the reason that they can be irradiated from only one angle It is easy to kill the topmost layer of carcinoma cells that lie next to the tube, but as these carcinomas usually penetrate the deeper tissues and commonly have considerable lateral extension the more distant cells receive an insufficient dose or sometimes only a stimulating dose Carcinoma of the uterus on the other hand owing to its central location can be irradiated from six or seven different angles which makes the prognosis more favorable

Effect of Cholelithiasis on the Stomach—Rohde finds that with a tendency to gallstones hypoacidity is usually present as the result of the loss of the function of the gallbladder When hypoacidity is noted after removal of the gallbladder, it is therefore not the result of the operation as it had preceded the latter With chronic cholelithiasis the stomach and duodenum may change their shape and position, as can be seen with the roentgen rays In many cases there are at the same time motor disturbances from adhesions between the gallbladder and neighboring organs Patients are however seldom much affected in their general health by these changes If operation is in any wise indicated cholecystectomy, with or without a T drain is always to be preferred to any more conservative operative method as it is a question of removing a gallbladder that is entirely useless from the physiologic and functional standpoint while the operation protects the patient against further evil consequences which might result from retention of the organ

Intravenous Strophanthin Therapy—Roderburg states that intravenous strophanthin is indicated in mild cardiac insufficiency of whatever origin (vitium myocarditis hypertonia), but that it is not adapted for combating circulatory insufficiency following acute infectious diseases When indicated, it is superior to digitalis by mouth or vein as is especially noticeable in cases of the type of congested liver Certain cases of dropsy of nonrenal origin are not influenced by strophanthin and yield only to theobromin preparations The strophanthin injections are absolutely harmless even with very high blood pressure and in the final stages of chronic nephritis In fact he says severe cardiac insufficiency associated with nephritis s more liable to be influenced by the intravenous use of strophanthin As an initial dose he recommends not more than 0 5 mg and often uses not more than 0 3 to 0 4 mg The maximal dose is from 0 75 to 1 0 mg The intervals should be at least twenty-four hours and are usually from two to five days He has thus treated about 100 patients in the last eight years

A Source of Error in the Sulphosalicylic Acid Test for Albumin in Urine—Schall reports that sulphosalicylic acid when combined with urine containing large amounts of calcium produces a precipitate which so closely resembles albumin as to cause confusion The precipitate is however, denser than any sediment or other clinical findings Control tests with other albumin reactions heating or previous dilution of the urine serve to avoid diagnostic errors

Comparison of Recent Staining Procedures for Tubercle Bacilli—Jotten and Haarmann commend their modification of the Spengler method for the demonstration of tubercle bacilli After the smear has been stained in the usual manner, with carbolfuchsin solution it is decolorized (twenty seconds) with a 15 per cent nitric acid solution It is then briefly rinsed and again treated for ten seconds with nitric acid, rinsed again and afterward counterstained for about thirty seconds in Spengler's picric acid-alcohol mixture (saturated aqueous picric acid and absolute alcohol, equal parts) The smear is again rinsed and allowed to dry and is now ready for microscopic study Out of 170 sputum specimens the Ziehl-Neelsen method yielded fifty-nine positives and the Spengler original method gave sixty-one, whereas the modification just described furnished sixty-two positives Furthermore, the average number of bacilli visible in the field was thirty-one for the modification twenty-six for the Spengler original method and only thirteen by the Ziehl-Neelsen method

*Inflammation in the Dental Sac in Young Infants M Zarfl —p 266
Diagnosis of Solitary Tubercle in Spinal Cord R Wagner —p 322
*Arhinencephalia Monstrosity Alice Goldstein —p 328

The Metabolism in Rachitis—Grosser devotes seventy-one pages to the metabolic findings and other minute details of experiments on ten infants injected parenterally with different calcium and phosphorus compounds on comparable diets, in an effort to learn which of the different calcium salts are most readily assimilated by the child with a tendency to rachitis He does not draw any general conclusions from the research

Possibility of Diphtheria in the Newly Born—Groer comments on the importance of the passive antitoxin immunity to diphtheria possessed by certain newly born infants Romminger has recently reported that 23 2 per cent developed diphtheria among forty-three newly born known to be carriers of virulent diphtheria bacilli 76 8 per cent showed no sign of the disease Groer has found that the general proportion of the immune is about 84 per cent at birth but drops to 71 9 by the fourth month to 56 6 per cent by the end of the sixth and to 30 per cent by the end of the year Of course if the mother is not able to generate antibodies, the newly born will lack this protection

Inflammatory Process in Dental Sacs in Nurslings—Zarfl gives an illustrated description of six cases of the phlegmonous or osteomyelitic form of inflammation of the dental germ with production of sequesters and discusses the condition from eleven different standpoints The permanent teeth do not seem to be injured by the stormy process in the alveoli, but the first teeth involved are destroyed Recovery is known in only one of the twelve cases on record and a tendency to recovery in one other Erysipelas of the face was the primary disease in some of his cases The prognosis is better in the phlegmonous form, with the primary process in the gums No instance is known of infection of the mother or wetnurse by the child's nursing, but it would be safer to the child with drawn breast milk

Arhinencephalia—Goldstein's study of a monster with the olfactory lobe and most of the hind brain missing seems to confirm the assumption that pressure or traction from the amnion is responsible for such deformities, and also for cyclops monstrosities

*The Clinical Significance of Cylindroids F Eigenberger —p 354

The Clinical Significance of Cylindroids—On the basis of examination of 81 cases of uncompensated heart disease Eigenberger reports that his results confirm the views of von Jaksch and Quensel who ascribe to cylindroids a certain clinical importance as signs of disturbance of renal circulation Eigenberger could demonstrate cylindroids in 36 or 44 per cent of his 81 cases In most of the cases in which cylindroids were present there were strong clinical signs of disturbed renal circulation In 2 of the cases with large numbers of cylindroids, necropsy disclosed marked renal stasis

*Heterochromia P J Waardenburg —p 1929
*International Scientific Terms J E. Schulte —p 1941
Unusual Causes of Ileus J F O Huese —p 1944

Heterochromia.—Waardenburg compares the various theories in regard to diversity of color in irises, and describes 7 cases in which it accompanied paralysis of the sympathetic nerve In his 73 cases of heterochromia in man in 37 only one iris showed a diversity of coloring In 5 there was melanosis of one eye and in 6 there were other anomalies in the eye

International Scientific Terms—Schulte expatiates on the international character of medicine as a science and as an applied art Other sciences, law perhaps chemistry etc have a more national character, but medicine is preeminently international—its object being to help the sick man regardless of all other circumstances He refers with envy to the time when all scientists were familiar with Latin, half of Boerhaave's students were foreigners from all parts of the civilized world and all were equally at home in his lecture room Medicine in particular he says needs international terms as it is not a finished structure but is being built up by contributions from all lands, and the easier the intercourse between workers, the more rapidly the building proceeds New ideas call for new terms to express them and the names given to new discoveries are accepted at once the world around like 'telephone,' 'automobile' etc The new names may not please the purists, he quotes Anatole France's remark 'Diseases, the horror of man, have names that are the horror of the philologist" The anatomists Schulte adds, are fortunate in having internationalized the terms they use

*Familial Pernicious Anemia E Meulengracht —p 777

Familial Pernicious Anemia—Meulengracht relates that four of the sons in a family with thirteen children and the son of one of the daughters developed typical pernicious anemia Three of those affected have died Achylia was found in the three whose stomach content was tested He suggests that possibly an inherited predisposition to achylia may have been the primary factor In any event, the familial occurrence confirms the assumption of one or more endogenous factors
